 Ajuga Brockbankii, 286
 Algae, the utilisation of marine, 222
 Allardice, Mr. Arthur, 202
 Allium sphaerocephalum, 186; A. triquetrum, 482
 Allotment gardens, compensation for, 428
 Allotment holders and playing fields, 338
 Allotments in Leipzig, 398
 Almond industry in Majorca, 417
 Alpine garden, 8, 26, 48, 73, 86, 114, 147, 168, 189, 206, 226, 244, 264, 286, 325, 342, 364, 382, 402, 423, 443, 463, 482, 503, 526
 Alströmerias, 326
 Alyssum spinosum, 48
 America, a day in, 386
 American Gooseberry mildew, 201
 American notes, 266
 Amicia zygomeris, 327
 Ampthill Park, the flower garden at, 73
 Anaphalis nubigena, 327
 Anchusa italica, 6
 Anchusas in pots, 464
 Anderson, Mr. G. F., 358
 Androsace carnea, 463
 Anemone apennina, a lost form of, 521; A. Seemannii, 482; A. vitifolia var. tomentosa, 287
 Anemones, 402
 Annals, 146

Answers to Correspondents:—

AGREEMENT OF LAND AND HOUSE ACCOMMODATION, 317; Ampelopsis Veitchii dying, 120; Antirrhinums diseased, 120, 179; Apple leaves scorched, 99; Apples diseased, 317; Big bud mite, 475; Bowling green, re-turfing a, 515; Bracken in new garden land, 219; Cabbages, club root in, 79; Carnation leaves diseased, 317; Carnation rust, 436; Carnations and Cyclamens failing, 120; Caterpillars on Bird Cherry, 238; Chermes on Pine shoot, 99; Cherry tree failing to bear fruit, 160; Cherry trees gumming, 200; Clanthus puniceus, propagating, 99; Clover on lawn, 455; Club root in Cabbages, 79; Creosoting tree stakes, 317; Cucumbers failing, 40, 99, 257; Cyanide for the destruction of

white fly and mealy bug, 317; Daisies on a tennis lawn, 238; Delphinium leaves diseased, 238; Drives, material for, 495; Elephant Hawk Moth Caterpillar, 336; Fig trees, 297; Flower beds, furnishing, 436; Fruit trees, the removal of, 297; Galls on roots, 200; Gardener, licence for a, 336; Gardener's reference, 60; Gladioli, late-flowering, 375; Gooseberry leaves spotted, 20; Grapes failing to colour properly, 278; Grapes spotted, 99, 120; Hollyhock leaf rust, 200; Horse manure, 297; Hydrangeas, blue, 20; Irises for garden border, 219; Iron sulphate for spraying, 475; Jays and rabbits, destruction by, 238; Lake, slimy, mossy, growth in, 20; Lavender plants dying, 375; Lawn: (Clover on, 455; weed from, for identification, 395; Licence for a gardener, 336; Maggots in soil, 79; Marigold, fasciated, 20; Melon seeds germinating inside the fruit, 317; Melons failing, 20, 257; Mint affected, 20; Morello Cherry trees gumming, 200; Mussel scale on Palm leaves, 60; Nectarines splitting, 20; Neighbour's claim of land, 455; Oleanders, 238; Onion bulbs attacked, 20; Peach border and Peach case, 495; Peach Hale's Early, 120; Peach: leaf curl of, 20; leaves blistered, 99; shoots discoloured, 40; splitting, 160; Peaches and Nectarines failing, 60; Pear leaves blistered, 99; Pears and Peaches diseased, 40; Pears and Plums dropping, 40; Pine shoot infested with Chermes, 99; Potato blight, spores of, 179; Potato haulm diseased, 200; Pot Pourri, how to make, 120; Roses under Glass, 515; Slugs, the control of, 200; Stakes, creosoting tree, 317; Strawberries diseased, 140; Sweet Pea foliage turning yellow, 99; Tennis lawn: Daisies on a, 238; fungous growth on a, 140; Tomatos: diseased, 40; failing to colour, 99; Tree stumps, destruction of old, 415; Tulips: branched, 60; for planting an elliptical bed, 317; Vine borders, 515; Vine leaves: mildewed, 160; with warty growths, 20; Vines, lifting and replanting, 455; Violas diseased, 140; Walls of flint and chalk, 99; White fly and mealy bug, cyanide for the destruction of, 317; Wireworms in soil, 219; Wood lice among Orchid roots, 40; Worms in rockery of alpine house, 395; Yew hedge dying, 120; Antholyza Caffra, 327
 Antirrhinum Asarina, 114, 443
 Antwerp, great international Horticultural Exhibition at, in 1930, 357
 Aphelandra nitens, 112
 Aphelexis, 126
 Apiary notes, 14
 Apple and Pear scab, 74
 Apple Cucumber, the Australian, 352
 Apples: varieties of:—Adams's Pearmain, 472; Brabant Belle-fleur, 492; Cardross Green, 392; Coe's Golden Drop, 155; Cornish Gilliflower, 430, 452; Court Pendu Plat, 155; Duchess's Favourite, 472; Dumelow's Seedling, 115; English Codlin, 430; Golden Pippin, 430; Saltcote Pippin, 411; Sops in Wine, 526; Wealthy, 352
 Apple crop: a clean, 155; the Cider, 141
 Apples: as roadside trees, 138; colour in, 412; frost injury to, 154; grading and packing, 397; in a Scottish garden, 392; of peculiar colour, 472; the best dessert, for cordons, 371
 Apples and Pears, improving the flavour of, 472
 Apricot, the, 35, 352
 Apricot St. Ambroise, 234
 Araucaria Bidwillii, 294, 483
 Armeria caespitosa, 443
 Arnold Arboretum, the, 201
 Artemisia camphorata, 423
 Anthropodium cirrhatum, 168
 Artichoke, the Globe, 493
 Asclepias curassavica, 383; A. Hallii, 287
 Asperula suberosa, 286
 Aster growing in the Ukraine, 223
 Aster subcaeruleus, 26
 Astilbe chinensis pumila, 244; A. simplicifolia, 342
 Athens, street trees of, 106
 Atkinson, Mr. James W., appointment of, 239
 Attalea Cohune, 161
 Autumn coloration, 377
 Azara microphylla, 467

B

BAGATELLE ROSE TRIALS 48
 Bananas, an increasing trade in, 437
 Banffshire Field Club, 478
 Banks, the treatment of dry, 246
 Barth, Prof. Erwin, 122
 Bathgate, a new public park for, 61
 Bean, Mr. W. J., 2
 Bedding, spring, 194

 Bridgeford, Mr. J. M., 163
 Brighton, new sports ground for, 281
 British Guiana, 70
 Brooklyn, a new Rose garden for, 22
 Brown, Mr. H. H., 498
 Bruner, W. E. (*Root Development of Root Crops*), 448
 Brussels: exhibition of fungi in, 300; Sweet Pea show in, 22; the Botanic Garden in, 240; window box competition in, 82
 Buddleia alternifolia, 324, 344
 Buildings, some garden, 33
 Bulb garden, 6, 26, 48, 88, 167, 186, 229, 266, 286, 305, 326, 342, 362, 383, 402, 422, 442, 462, 482, 519
 Bulb growing in Dublin, 378
 Bulbinella Hookerii, 422, 493
 Bulbs: for the garden, 221; for the Royal Parks, 163; the naturalisation of, 167
 Bullaces and Damsons, 472
 Burford Lodge, Dorking, November flowers at, 378

C

CABBAGES, 75
 Caesalpinia Gilliesii, 246
 Caladiums, 284
 Calanthe Hexham Gem var. Phyllis, 458
 Calceolaria integrifolia, 422; C. plantaginea, 325
 Calluna vulgaris, 47
 Calystegia sepium, dialysis of, 130
 Camellias, 502
 Campanula Hallii, 189; C. persicifolia, 304; C. phytidocalyx, 66; C. punctata, 365; C. speciosa, 146, 188; C. Vidallii, 226
 Cape Province, two valleys in the western, 110
 Cardboard for crops, electrified, 260
 Cardoon, the, 451
 Carnation, a black (?), 398
 Carnations, old border, 364
 Carnations: a border of, 226; border, 6, 86, 246; failure of out-door, in the north, 42; new, 166; Red Spider on, 55
 Carpenter, Mr. G., 398
 Carpentaria californica, 69
 Carrots, late, 75
 Carrots, winter, 492
 Carslaw, R. McG. (*The Economy of a Norfolk Fruit Farm, 1923-26*), 391
 Cathartica villosa, 484
 Cattleya Dowiana, 342; C. labiata, 284; C. Warscewiczii, 146
 Cattleyas, Laelio-Cattleyas and Brasso-Cattleyas, yellow-flowered 485
 Cauliflower cultivation in Erfurt 398
 Celastrus articulatus, 484
 Celery, 15; blight of, 101; diseases and pests of, in 1927, 512
 Ceratostigma plumbaginoides as a basket subject, 152

Certificated Plants:—Acacia Cunninghamii, 413; Aphelandra squarrosa var. Leopoldii, 272; Aquilegia coerulea, 218; A. glandulosa, 218; Aspidium (Polystichum) aculeatum var. angulare flabellipinnatum, 494; Begonias: Albatross, 19; Mrs.

Ward, 38; Sir Philip Sassoon, 38; Bertolonia sericea cristata, 272; Brasso-Cattleya British Queen var. Enchantress, 218; B.-C. Evansiae, 218; B.-C. Innocence, 219; B.-C. Jazz, 316; B.-C. Muriel var. Adamsonae, 139; B.-C. Muriel var. Invincible, 354; B.-C. Pallus var. grandis, 219; B.-C. Rosita, Llewelyn's var., 473; B.-C. Vilmoriniana, Brockhurst var., 412; Brasso-Laelia Admiral Jellicoe, 219; Brasso-Laelio-Cattleya Muriel, Llewelyn's var., 473; B.-L.-C. Ursula var. Princess Elizabeth, 218; Calanthe Hexham Gem (see p. 458), 452; C. Hexham Lad var. Richard, 452; Canna Sweetheart, 272; Carmichelia Australis, 78; Carnations: Allana-Dale, 177; British Legion, 177; Canadian Pink, 452; Cattleya Mauve, 413; Clarence, 177; Eglinton, 166, 177; Jim Dalton, 166, 177; Maud Allwood, 413; M. Black, 177; Melchet Beauty, 452; Rosie, 166, 177; Wivelsfield Claret Improved, 452; Cattleya Aeneas, 218; C. Alaric, 139; C. amabilis var. alba marginata, 296; C. amabilis var. White Queen, 316; C. Corona Rawdonensis, 414; C. Eleanore var. Comet, 219; C. Fabia var. Queen Elizabeth, 334; C. Falcon, Towneley Grove var., 139; C. Hardyana alba, Llewelyn's var., 219; C. H. a., Vestey's var., 219; C. H. var. Dracula, 219; C. H. var. Jupiter, 219; C. H. var. Royal Crimson, 218; C. H. var. The Sultan, 219; C. Harold alba var. Noel, 139; C. Hassallii var. Hercules, 218; C. Helga, 219; C. Heliodor var. Golden Gem, 218; C. Horos, 236; C. Irene var. Queen Elizabeth, 218; C. labiata, Llewelyn's var., 414; C. Lady Veitch var. Snowdrift, 296; C. Lorna var. Princess Royal, 218; C. Luegeae var. Vivid, 219; C. Momus var. Duchess of York, 218; C. Mrs. Medo var. Goliath, 296; C. Princess Royal, 334; C. Princess Royal var. Towneley, 316; C. Profusion var. Colossus, 296; C. suavior, Llewelyn's var., 473; C. s. var. excelsa, 219; C. Sylvia, Bolholt var., 354; C. Venus, Orchidhurst var., 414; C. Vesta var. Madonna, 318; C. V. var. Purity, 219; Chrysanthemums: Albion, 414; Annice, 415; Blackpool, 393; Bonnie Lass, 336; Charles Davis, 393; Cheerful, 336; Daffodil, 272, 336; Daphne, 372; Dark Lady, 415; Edith Seymour, 393; Elsie Crook, 413; Enid, 413, 414; Gaiety, 452, 475; Gloria, 272; Glow, 272, 296; Jack Robbins, 272, 296; Jim Stacey, 336; John Hall, 475; Leicester, 415; Mayford Bronze, 237, 257; Monument, 393; Mrs. E. H. Pearce, 413, 414; Mrs. E. Page, 452, 475; Mrs. F. C. Maples, 334, 336; Mrs. Keith Luxford, 393; Pax, 372; Pearla, 237; Pinkest, 334, 336; Purple Robe, 336; Southampton, 393; Sun Gold, 336; Tom Abbott, 452, 475; Torch, 336; Winsome, 495; Yellow Star, 495; Clethra Delavayi, 78; Cotoneaster aldenhamensis ? (Forest ?), 372; Cymbidium Lucaste, 452; Cypridium Actaeon, 414; C. Astarte, Bridge Hall var., 56; C. Baldwinii, 219; C. Chardmoore var. Alfred Bridges, 372; C.

Chardmoore var. Mrs. Cowburn, 412; C. Gowerianum var. Mrs. Leonard Dixon, 334; C. Hiraethlyn, 157; C. H. T. Pitt, 493; C. Llewelyn Knight, 219; C. Louvain, Bolholt var., 414; C. Makeda, 474; C. Melody, 473; C. Memoria J. H. Walker var. Mars, 473; C. Montcalm var. H. Ashley Bell, 473; C. Morcar, 474; C. Morea, 474; C. Mrs. H. Arthur, 414; C. Perseus, Stonehurst var., 412; C. Perseus var. aurantiacum, 474; C. Puffin, 414; C. Rossettii, var. Towneley, 296; C. Westminster, 493; C. Windrush var. Memoria G. F. Moore, 493; Daffodils: Beryl, 179; Duncan, 179; Grenade, 170; H.M. Queen Alexandra, 179; Mavourneen, 179; Sulphur, 179; Sunrise, 179; Treskerby, 179; Dahlias: Clown, 296; Elma D. Cook, 296; Fred Ransome, 296; Freedom, 296; Giant Kriemhilde, 296; Irma, 296; J. L. Crowther, 296; Josephine Adair, 296; Mrs. D. Hepburn, 296; Mrs. J. Goddard, 296; Rev. M. Herbert Dee, 296; W. D. Cartwright, 296; Delphiniums: Howard H. Crane, 38; Lady Edith, 19; Lady Elizabeth, 19; Mrs. Foster Cunliffe, 38; Mrs. Paul Nelke, 19; Disa Italia var. AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 62.3°.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, June 29, 10 a.m. Bar. 29.8. Temp. 60°. Weather, Showery.

Botanical and Horticultural Adventure and Romance.

I. So accustomed are we to the great variety of trees and shrubs which greet us on every hand in Britain, that we might easily persuade ourselves the majority of them are English; and we the more readily accept this conclusion without giving it much thought, because a visitor to any flower show is convinced that a large number of flowers grown by nurserymen are never seen out-of-doors in this country, and must therefore have been introduced from abroad. Shops and street sellers also assist in the illusion by exhibiting yellow clouds of Mimosa and sheaves of Arums at a time of year when our own gardens and public parks are bare of colour; so that we draw a sharp distinction between these exotic-looking flowers and our own hardy plants, and look forward the more gladly to the English spring when trees foam into leaf and bloom all round us. Sit in one of the parks, in the very heart of the Empire, on a fine, spring day, and admire the very English scene, with its trim lawns, its formal, colourful beds, and its stately trees—the "immemorial" Elms, the chequered, angular Planes—most dear of London trees—and massive Poplars. But the Forsythia, which in Spring was a mound of butter-yellow, came from Japan, and its

name commemorates a great Englishman. In the south there is hardly a more typical English tree than the Horse Chestnut, and yet the Horse-Chestnut was introduced from the East. The Lilac and Laburnum, either of which may be seen in almost any London garden, are both naturalised aliens, while the Plane is no more English than the Larch. The beds of Rhododendron, covered with orbs of brilliant blossom, are hybrids raised from plants introduced in recent years, and all our ornamental Conifers are of foreign origin. And so it is with a large number of our most popular garden flowers—Tropaeolums, Tulips, Chrysanthemums, Lilies, Asters, Dahlias, and many more. Sitting in the shadow-barred sunshine, enjoying the fresh, bright colours and soft scents of an English garden, many questions present themselves. All these overseas plants—who brought them to England, and how? Pondering on this, we look at the neat beds and flowering trees with a new interest, trying to picture, by way of contrast, the dank, steaming jungle of the tropics, with the glittering alpine meadows on the lap of the snow mountains brooding over all. Most of the plants mentioned have been brought from a distance by plant hunters, who in their search for new species, or better varieties, have penetrated into some of the most inaccessible corners in the high places of the earth, situated amidst scenery terrifying in its grandeur, inhabited by primitive tribes, or worse still, not inhabited at all. Not without a thrill do we learn that Rhododendrons have been brought from Tibet, which men call "the roof of the world," and where hundreds of square miles are entirely covered with Rhododendron forest: that giant Conifers have been brought from the Rocky Mountains, and Azaleas from Japan, Araucarias from the Chilean Andes, and the bush Forget-me-not (Myosotidium) from a remote and lonely island in the Pacific Ocean. The call of the wild is so insistent that youth feels it is no great sacrifice to leave home for a time and face hardship and danger, if thereby he may add something to adorn the brow of England. The beginning of this century saw the close of an era of pioneer work unprecedented in its effect on the imagination of mankind; and a belief has spread that the age of exploration is over. It is true that no first-rate geographical riddle remains unanswered, but every generation has its own problems to solve, its own discoveries to make, no wit less important, nor even less spectacular, than those of previous generations, and it would be quite true to say that the age of exploration is perennial. The world challenges the pioneer mind like a gigantic question mark, and every problem laid to rest raises up two more in its name. But the greatest secret of this, as of every age, is the secret of Life itself, a subject which makes a special appeal to Englishmen. Not only has this country to deal with human problems in every part of the world, it has also led the van in the fight to rout ignorance and prejudice—those twin stumbling blocks in the path of progress, and solve abstract problems of Life as a whole. The book of exploration, even geographical exploration, we affirm, is not yet written, and any man determined to carve a niche in the roll of fame may rest assured that his chance is here and now. True, there are no more Poles to conquer, no new continents to discover, possibly not even any great rivers, mountains or lakes to reveal. The days of rough and ready pioneering are indeed over, at least for the present—though who can say that in a new age it may not all have to be done over again? But the

real exploration is yet to come. The world to-day is for the naturalist to explore; not merely the plant-hunter or the butterfly collector, but the trained observer. Nowadays, we over-specialise, and collecting has become identified too much with the acquisitive spirit, and divorced from the pioneering spirit. The great Victorian naturalists lived abroad for years, collecting, classifying and observing. They sent home vast collections for further study, but they themselves worked out many problems on the spot. They thought boldly, ahead of their age, with that touch of imagination which is akin to genius, and under their leadership the study of natural history grew at a prodigious pace. Who can assess the influence which such men as Darwin, Wallace and Hooker had, not only on their fellow-countrymen, but on the whole western world? Had Darwin not written the *Origin of Species*, we should still owe him a debt for the *Voyage of the Beagle*. Wallace's *Island Life* and *Malay Archipelago* are fascinating works, as is Hooker's *Himalayan Journal*. Such books are rarely written nowadays; the writing of a good natural history travel book is almost a lost art, though we have other models besides those mentioned—Waterton's *Wanderings in South America* and Bates' *Naturalist in Nicaragua* being among the best. In each of these the glamour of the tropics has laid its spell on the author, who not only describes the lavish scenery, but is also inspired to throw a flood of light on many a knotty problem. Thus we are led to share his enthusiasm, to marvel at the sights he saw, revel with him amidst the luxuriant vegetation, and bask in the glorious hot sunshine where life is lived at high speed. But if the modern traveller does not know enough about natural history, assuredly the modern naturalist does not know enough about Life at first hand in the forcing house of the tropics, because he is not a traveller. And it is to the tropics one must go if one would grasp something of the mystery of Life. There is something lacking in the Temperate Zone, not only in degree, but in kind. There, where Life is lived at high pressure, the strangest and most exquisitely adapted forms of life are met with; as though under conditions of maximum provocation and intensive civil war, only the queer and wonderful survive. The study of natural history is in danger. The great wave of enthusiasm raised by the romantic discoveries of the Victorian naturalists has spent itself. Every by-way of which they illuminated the entrance has been explored, and at the end of the passage, when the light has grown dim, men have had recourse to the microscope, still further restricting vision. We are far from decrying the microscope. Many a close secret has been unravelled by its aid alone, and it has stimulated research in every direction. But the modern tendency is to regard the microscope as the end rather than the means, and its place in the combined attack on the unknown requires readjustment. A new inspiration is needed, a new leader, one who will fire the ardour of the rising generation as did the famous hypothesis to which the name "*Origin of Species*" was given. Can another such leader as Darwin arise in the heavy atmosphere of the Laboratory, or the dusty herbarium, or in our dull, unimaginative museums? More and more our young scientific men settle down to routine work without ever having seen the tropics, thereby sacrificing the greatest adventure in education. What was once the rule is fast becoming the exception. Nor are there to-day the same opportunities as of old.

The Dominion Universities are turning out their own men; a different status has been given to some of the famous colonial gardens, whereby they no longer look to us for a supply of trained botanists. Above all, the blessed word "research" has claimed thousands of victims, who peer through the microscope until a chronic myopia prevents them from seeing anything but the nearest trees. Research is a fine thing in its way, and a necessary thing; but it comes at the end of the chapter, not at the beginning. It would seem then that the call of the wild to-day has sunk to a husky whisper, else the romance and adventure of the field naturalist's life would lure the Englishman as of old. Never let it be thought that the high qualities which animated the old pioneers are not required by the new explorers; patience, courage, foresight, infinite adaptability, and a fierce but controlled and calculating determination are essential to the modern explorer of Life who would make any headway against the growing barrage of ignorance. For it is to Life that every useful investigation ultimately returns, with the everlasting query—What is Life? The chemist may investigate the reactions and properties of matter, but the future lies with the organic chemist who explores the complex materials through which life is expressed. The physicist investigates the structure of atoms, as the basis of matter, and we find that in explaining matter he has explained it away; so that unless he can bridge the gulf between matter and mind his results will ultimately be sterile. It would seem then that we are working on wrong lines; the division of labour has gone too far, and the field naturalist is too completely divorced from the laboratory worker. We require more vision and fewer visionaries.

The Fruit Crops.—Will correspondents who have kindly furnished us in the past with reports on the fruit crops notify the Editors of any change of address. The forms will be sent out in the next week or so, and we shall be pleased to send one to any reader specially interested in fruit-growing; application should be made to the Editorial Department.

Honour for a U.S.A. Chrysanthemum Raiser.—The Michigan State College has conferred the Degree of Master of Horticulture on Mr. Elmer D. Smith in recognition of his work in Plant Breeding. The honour is the first of its kind. Mr. Smith flowered his first Chrysanthemum seedlings in 1889, and the first notable variety he raised, named Flora McDonald, was sent into commerce in 1890. Since then, he has raised 432 varieties of Chrysanthemums as well as Cannas and Pelargoniums. Mr. Smith was formerly secretary of the Chrysanthemum Society of America, and was for two years its President.

Compton Acres.—The beautiful gardens at Compton Acres, Canford Cliffs, Bournemouth, the property of T. W. Simpson, Esq., were opened to the public on June 22, when a charge was made on behalf of the Queen Alexandra National Memorial. No fewer than twelve hundred people took advantage of this opportunity of inspecting the rock, Italian garden, Japanese garden and other features of Compton Acres; the day was fine and we learn that the visitors were delighted with all they saw, and none abused the privilege of admission.

International Horticultural Congress, Vienna.—A certain number of the festivities in connection with the Centenary of the Austrian Horticultural Society this year have already been held, notably the very successful horticultural exhibition described in our issue of May 28, p. 367. Other festivities remain, however, including a Dahlia exhibition, to be held during the summer, a Fruit Show to take place in October, and perhaps most important of all, the International Horticultural Congress, which will commence on September 19 and last for a week. Besides

discussions on subjects of interest to gardeners of all ranks and tastes, there will be excursions, visits to nurseries, botanic gardens, museums, etc., in such numbers as more than to fill the whole time, the intention being that those attending the Congress should have ample choice of occupations according to their own particular tastes and interests. The complete programme may be obtained from the Congress Secretary at Vienna (Wien 1, Parkring 12).

Mr. W. J. Bean.—On the afternoon of Tuesday, June 21, members of the Kew Staff, and about thirty members of the Garden Club, assembled in the Garden Library to do honour to the much esteemed Curator, Mr. William Jackson Bean. The occasion was the formal presentation by Major Reginald Loder of Mr. Bean's portrait to Kew, a photographic reproduction of which is given below. The Director of Kew, Dr. Hill, in opening the proceedings, said a few words from him seemed desirable as a reason for the gathering that afternoon. Some of them would

MR. WILLIAM JACKSON BEAN, I.S.O., V.M.H.
Reproduced from a photograph of the painting by Mr. Ernest Moore.

remember that among the portraits painted by Mr. Ernest Moore, and exhibited at his Exhibition of pictures of famous Yorkshiremen last year, there was one, very properly, of Mr. Bean. He felt at the time that the ultimate home of the portrait should be Kew. In considering ways and means of acquiring the picture, it occurred to him that the members of the Garden Club, to whom Mr. Bean was very well known, might be willing to purchase the portrait for Kew. He approached Mr. Gerald Loder, who promised to consult the members. The first person to whom Mr. Loder mentioned the matter was his brother, Major Reginald Loder, who, with his usual whole-hearted generosity, at once volunteered to purchase the picture himself if Kew, through the Ministry of Agriculture and Fisheries, would accept the portrait. Their meeting that day was the outcome, and he would now ask Lord Lambourne to remove the curtain and expose the portrait to view. Before this actually took place, Major Reginald Loder asked to be permitted to say a few words in explanation of his action in the purchase of the picture. It was mainly for three reasons: first of all, in view of the ready aid that Kew was always willing to give him in helping to solve his many gardening problems; secondly, Mr. Bean, despite his modesty and retiring disposition, was ever ready, with his unique knowledge, to help him, an absolute tyro, with advice on the growing of plants and their names; thirdly, Mr. Bean was the author of that wonderful book, *Trees and Shrubs Hardy in the British Isles*, which they all knew so well,

and from which most of his own knowledge and enthusiasm for plants had been obtained. He would like to say how much these two volumes needed a third to bring the subject up-to-date, and he hoped it would soon be ready for the printers and in their hands. Lord Lambourne, in explaining his presence in that position said it was as President of the Royal Horticultural Society he was there that afternoon. The relations between that Society and the Director and Staff of Kew were of the best, and members of the Kew Staff were always ready to help the Society in every way. He was very glad to be there that afternoon, particularly to do honour to their Curator. Mr. Bean was a Yorkshireman. He had hoped, in fact, he expected, that a man so respected and liked would have had some connection with his own county of Essex, but Mr. Bean assured him he had none. Lord Lambourne then unveiled the portrait, and formally presented it to the Director, who accepted it on behalf of the Royal Botanic Gardens, Kew. In response to numerous calls for a speech, Mr. Bean said they might be interested to hear the origin of the portrait. He met Mr. and Mrs. Moore in the Gardens one afternoon, and he and Mrs. Moore sat on a seat talking for some time after Mr. Moore had left. A few days later he received a letter from Mr. Moore, prompted, no doubt, by his wife, asking if he would sit for his portrait. Evidently Mrs. Moore was more impressed by his personality than the artist. He would like to thank Major Loder for the gift of the portrait to Kew, and the large gathering he saw in the room for their presence that afternoon. Sir David Prain then proposed a vote of thanks to Lord Lambourne, busy man though he was, for coming among them to unveil the portrait. He thought also they would like him to thank the artist, Mr. Ernest Moore—who was present with Mrs. Moore—for giving them such a faithful likeness of Mr. Bean and so pleasant a picture.

Linnæan Celebration in Bonn.—On May 23, the 220th birthday of the great Swedish botanist, Karl von Linné, the new glasshouses of the Bonn (Germany) Botanical Institute—which have been under construction for three-and-a-half years—were opened in the presence of a distinguished gathering of people. The houses cover an area of 2,200 square metres, which is double as much as the former ones. They are constructed of concrete foundations, with iron and pitch-pine roofs and sides, and the heating is of the newest and best kind.

Reunion of University College London Botanists.—On Thursday, June 23, at Pagani's Restaurant, in connection with the Centenary Celebrations of the College, a dinner was given by the Staff of the Botanical Department, supported by the research workers in the Laboratories, to former members of the staff and to botanical delegates who were attending the celebrations. Professor F. W. Oliver presided, and among the old members present were Dr. D. H. Scott, Professor F. E. Weiss, Dr. C. A. Barber, Professor John Percival, Mr. W. C. Worsdell, Professor A. G. Tansley, Dr. F. F. Blackman, Professor V. H. Blackman, Mrs. A. G. Tansley, Dr. Agnes Arber, Dr. Marie Stopes, Dr. Ethel N. Thomas, Professor F. E. Fritch and Mr. V. S. Summerhayes. Professor F. O. Bower was prevented from attending, having to be present in Glasgow on the same date to receive the presentation portrait painted by Orpen, on his retirement from the Glasgow chair after forty years. Among the botanical delegates who attended were Professor C. H. Ostenfeld, of Copenhagen, Professor G. Senn, of Basel, Dr. L. G. M. Baas-Becking, of Stanford University (California), Dr. R. Ramsay Wright, of Toronto, Professor P. F. Fyson, of the University of Madras, and Dr. A. W. Hill, Director of the Royal Botanic Gardens, Kew.

Phytopathological Excursion.—The annual Phytopathological Excursion, arranged by the British Mycological Society, will take place on Saturday, July 9, when the Research Station at East Malling, Kent, will be visited. The train leaves Victoria at 9.55 a.m., arriving at East Malling Halt at 11.22 a.m. The programme includes a General Account of the Station and its Activities, by the Director, Mr. R. G. Hatton, M.A.;

Reversion in Black Currants, demonstrated by Mr. Hatton and Mr. Amos; Lunch. 12.30; Brief Outline of the Pathological Problems under investigation at East Malling, by Dr. H. Wormald; Tour of Egham Field and Great East Field, and examination of specimens, cultures, etc., in the Laboratory. Features of pathological interest include examples of "Die-back" in Plum trees, various Raspberry diseases, Walnut bacteriosis, spraying experiments against Raspberry Anthracnose, and Apple spraying experiments, etc.; Tea will be provided at 4 p.m., followed by a general discussion. By the kind invitation of the Director, Mr. R. G. Hatton, and the Committee of Management, members will be the guests of the Research Station at lunch and tea. If a sufficient number travel by the 9.55 from Victoria, it may be possible to arrange for a party ticket. Will those intending to be present notify Miss E. M. Wakefield (Secretary), Herbarium, Royal Botanic Gardens, Kew, not later than Saturday, July 2, and state whether they will be joining the train at Victoria. The return train leaves East Malling 5.28 p.m., arriving at Victoria 6.57 p.m.

Importation of Potatos (Malta) Order of 1927.—In view of the discovery of the Potato Moth in consignments of Potatos imported this season from Malta, the Minister of Agriculture and Fisheries has made an Order under the Destructive Insects and Pests Acts, 1877 and 1907, prohibiting the landing in England and Wales of any Potatos grown in Malta unless they are accompanied by the certificate of health prescribed in the Destructive Insects and Pests Order of 1922. The order came into operation on June 21, but it allows for the landing of Potatos shipped from Malta prior to that date.

Horticultural Club Outing.—On Thursday, July 14, the members of the Horticultural Club will visit the Royal Horticultural Society's Gardens at Wisley. The journey will be made by charabanc, starting at 10.30 a.m. on the Embankment, outside Charing Cross District Railway Station, and thence to the Hut Hotel, Ripley, for lunch. After tea, the return journey will be made about 6.30 p.m. Applications for tickets should be made to the Hon. Secretary, Mr. G. F. Tinley, 855, London Road, Westcliff-on-Sea, Essex.

The Golden Valley, Hindhead.—We learn that the vendors of the ninety-six acres composing the lovely Golden Valley at Hindhead, Surrey, have extended by a fortnight the time of completing the purchase (see p. 440, June 18). The price at which Dr. Marie Stopes prevented the area from falling into the hands of the builders was £5,650, and towards this amount about £4,300 has been collected and promised. All who are interested in saving this famous beauty spot, and placing it under the National Trust, are urged to send donations to the Hon. Treasurers, or Mr. S. H. Hamer, The National Trust, 7, Buckingham Palace Gardens, S.W.1.

An Advertising Postmark.—The horticulturists of the Rose-growing town of Sangerhausen, in Germany, combined together and had a post-mark made, "Sangerhusen, the Town of Roses," which the postal authorities consented to use on all out-going letters, the cost being a tax of five marks per quarter. With the fall in the value of the mark, however, and in consequence of a different method of estimating the amount of the correspondence on the part of the Company handling these postal advertisements, the price has been raised to 150 marks per quarter, or 600 marks per year, and it has been decided to discontinue it.

Insect Pests of the Empire.—The Empire Marketing Board has provided funds for the establishment of a station at Farnham Royal under the direction of Dr. Marshall and Dr. Neave, of the Imperial Bureau of Entomology, to discover, breed and dispatch over the Empire parasites which keep down the number of harmful insects. Such stations have already been established in the United States, but it is a new departure for the British Empire. The Empire Marketing Board was led to set aside funds for this purpose by two considerations. First, the importance of our imports of foodstuffs and raw materials, which are directly affected

by the present inadequacy of entomological research, and secondly the keen interest of the Governments of the Empire overseas, who are themselves already beginning to contribute directly to this entomological work. The laboratory will be under the direction of the Imperial Bureau of Entomology, and a beginning has been made with the construction of insectaries and with the laying out of the grounds with plants and trees required for investigation.

"Gardeners' Chronicle" Seventy-five Years Ago.—*The Botany of the Antarctic Voyage, II. Flora of New Zealand.*—By J. D. Hooker, M.D.; 4to.; Part 1, Reeve and Co.—At length we may hope for some connected account of the botany of our Australasian Colonies. Dr.

that the beautiful execution of the work renders it a "library book," even for those who are not interested about natural history. *Gard. Chron.*, July 3, 1852.

Appointments for the Ensuing Week.—SUNDAY, JULY 3: Wakefield and North of England Tulip Society's meeting. MONDAY, JULY 4: Post Office Savings Bank Horticultural Society's show; Romsey Gardeners' Association's meeting. TUESDAY, JULY 5: Royal Horticultural Society's Committees meet; Royal Agricultural Society of England show (five days); Royal Caledonian Horticultural Society's meeting. WEDNESDAY, JULY 6: National Rose Society's provincial show in conjunction with Cheltenham Spa Floral Fête (two days); Croydon Horticul-

FIG. 1.—LILIUM CONCOLOR, DROPMORE VARIETY.

R.H.S. Award of Merit, June 21. (See p. 6).

Hooker, whose energy and knowledge so eminently qualify him for the task, has now, with the aid of the Lords of the Admiralty, taken up New Zealand, of whose vegetation five parts of the present work will give ample details. It is to be hoped that the floras of Tasmania and Australia itself will follow in succession. The work is written in good plain English, with a view to the convenience of colonists, but without, on that account, being rendered in the smallest degree unscientific. Quite the contrary. It contains all the Natural Orders up to Saxifrageae; is illustrated by twenty excellent plates, and, as far as it goes, gives the New Zealand colonist the means of knowing all that Europeans can tell them concerning the singular vegetation of their island, which, "although luxuriantly clothed with vegetation, possesses remarkably few kinds of plants; the little island of Tasmania has nearly twice as many flowering plants, though fewer flowerless ones." Let us add,

tural Society's show; Nottingham and Notts. Chrysanthemum Society's meeting. THURSDAY, JULY 7: National Sweet Pea Society's show at the R.H.S. Hall (two days); Stoke-on-Trent Horticultural Society's show (three days). FRIDAY, JULY 8: Bath and District Horticultural Society's show (two days); Royal Horticultural Society of Ireland meeting. SATURDAY, JULY 9: Windsor, Eton and District Rose Society's show; Leigh-on-Sea Horticultural Society's show; British Mycological Society's Phytopathological meeting at East Malling.

Publications Received.—*Report on Celery Blight and its Prevention*, by H. H. Stirrup and J. W. Ewan; Midland Agricultural and Dairy College, Sutton Bonington, Loughborough.—*Encyclopédie Biologique I: Les Plantes Alimentaires chez tous les peuples et à travers les Ages*, by D. Bois; Paul Lechevalier, 12, rue de Tournon, Paris. price 75 francs.

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Odontoglossum Rossii.—This interesting Mexican Orchid should receive attention when it has finished flowering. Although this species and other *Odontoglossums* with small pseudo-bulbs, such as *O. Cervantesii*, *O. Krameri* and *O. Oerstedii*, succeed well under the treatment recommended for all the cooler members of this large family, it is advisable to grow them in shallow pans, as they resent an excess of material about their roots. They also need plenty of light and air whilst in full growth, but they should not be exposed to direct sunshine at any time.

Hybrid Cattleyas.—The many hybrid Cattleyas comprise plants of such a varied character that there are some that require attention at all seasons; but it is advisable not to disturb any during the winter if it can be possibly avoided. As a general rule, Cattleyas, *Laelias* and all their hybrids may be repotted a few weeks after their flowering period, provided they are making, or are about to make, new roots. Plants which produced their flowers in the depth of winter are best left until the early days of spring, when they may receive attention as they reach the desired condition. The many hybrids raised from the different species succeed under precisely the same conditions as their parents, and, being plants acclimatised from infancy, are easier to grow under artificial conditions. *C. Warneri*, its variety *alba*, and its hybrids, both white and coloured, succeed under similar conditions to the other members of this large family, although they produce their flowers at a different season, the earliest plants being now in bloom. When their flowers are over these plants should be exposed to more air and light, but never allowed to shrivel for want of water at the roots, as shrivelling even when a plant is at rest, is very exhausting to it.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Brussels Sprouts.—Plants of Brussels Sprouts that were set out early are growing strongly, and may have a little soil drawn to the stems; this will prevent the plants from being blown out of position by high winds. A careful watch should be kept for caterpillars, or much damage will be done quickly. It will be wise to examine plants which show signs of distress, and if found to be badly attacked by maggots they should be pulled up, and others planted in their places, taking care to dip the roots and stems in a puddle made of soot and clay.

Celery.—So soon as strong plants are ready, plant them forthwith in well-prepared trenches, as advised in an earlier calendar. The plants should receive as little check as possible. Dust them with old soot immediately to prevent attacks of the Celery fly. Anti-Fly Powder, or anything which makes the leaves distasteful, answers the same purpose.

Celeriac.—This useful vegetable should be planted out on well-prepared ground, enriched with well-rotted manure. The plants should be set in rows made about two feet apart, and at a distance of one foot apart in the rows. Water should be given the roots liberally throughout the growing season, and the soil stirred occasionally with the Dutch hoe. As the foliage is likely to be attacked by the Celery fly, the same precautions should be taken to keep insect pests in check as advised for Celery.

Leeks.—Where this vegetable is being grown for exhibition and, presuming the plants are growing in well prepared, enriched soil, the necessary cardboard bands or collars should be placed around the stems. The collars should

be about five inches to six inches in depth. When used properly, these cause the centre of the plants to lengthen, and should be raised from time to time until a sufficient amount of stem is blanched, sixteen inches being a good average length. Boards should be placed along the sides of the row, five inches from the plants, to keep the soil in position, which should be added and placed around the stems each time the collars are raised. So soon as the last lot of soil has been placed in position, it is wise to cover it with a small quantity of straw to prevent grit or dirt from splashing into the tops of the plants and thereby disfiguring them. All watering and feeding of the roots should be done outside the boards, in order to keep the stems as dry as possible. Diluted liquid manure from cowsheds, etc., is an excellent stimulant for Leeks.

Beetroot.—If seeds of round or globe varieties are sown now, small, tender roots will be available by the autumn, when they will be found very useful.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Young Trees.—Do not neglect the roots of late-planted trees. Water them freely at intervals until sufficient rain falls to penetrate the soil to a good depth; mulch the ground with manure or any other suitable material to preserve the soil moisture, and encourage the trees to make suitable growth. Trees that receive a severe check through drought early in the season fail to form sufficient growths to make healthy heads. See that the stakes to which the trees are attached are sound, or the latter may be damaged when high winds prevail. Remove all young growths along the main stems, also suckers from the roots.

Red Currants.—Our Red Currant bushes are only lightly cropped owing to the very severe frosts during the time they were in flower, consequently the growths are much stronger than usual and need to be shortened to the fourth or fifth leaf. Currants are often much infested with green fly, and if this pest is not destroyed early the fruits soon become black and soiled, being unfit for use. To ensure a crop of clean, bright fruits, it is advisable to syringe the bushes early with Quassia extract or some other insecticide, and afterwards wash the bushes well with clear water. Net the beds early against birds, for they will devour the berries even when quite green, and more especially in dry weather. Stop the lateral shoots of plants grown and trained on walls as cordons for supplying crops of extra fine fruits late in the season. Train the extension shoots in position, cleanse the leaves of insect pests, mulch the roots with decayed manure and water the soil well if it is dry.

Outdoor Vines.—Regulate and stop the laterals on vines in the open, if this has not been done already. Pinch the laterals a couple of joints beyond the bunches, and secure the young leaders, which have not reached their limits, to the wall or fence, to prevent them being damaged by storms. Make sure that all the young growths bearing bunches are suitably secured to the walls, also thin the berries early and water the roots with liquid manure; a little guano is also a good fertiliser for vines.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Figs in Successional Houses.—If all has gone well, the trees in these houses will now be supplying ripe Figs. A drier atmosphere should be maintained by a partial discontinuance of the use of the syringe, but the floors, walls and other bare surfaces should be damped regularly with diluted liquid manure once or twice a day in fine weather, and on no account should the roots lack moisture at this stage. Gather all ripe fruits before syringing is done to prevent them cracking. If required for home use

the fruits should be allowed to hang fully exposed to light and air until they are quite ripe and well coloured, but if they are to be packed for travelling a long distance, they should be gathered in a tender but not ripe stage. The house should be kept somewhat dry and airy, and the fruits should be gathered at least a day or two before they reach maturity. Late trees from which only one crop of fruit will be taken should have an abundance of fresh air and copious waterings at the roots. Pinching of the shoots is not necessary, and any fruits which show after the main crop is thinned should be removed.

Pot Vines.—Vines intended for starting next November will now be plumping up their buds, and the canes will soon be changing colour, indicating the first stage of ripening. Do not force the vines at this stage but continue to feed the roots and syringe the foliage. More air should be admitted gradually, and the house kept slightly drier through the night. If the canes have been stopped at six feet or nine feet, according to requirements, so soon as they were coloured their whole length, a few of the laterals may be removed, commencing at the base and working gradually upwards, leaving a few laterals near the top to run wild. Take care to preserve each main leaf. Many growers place the canes in the open to ripen; if the season is good and the vines can be secured to a south or west wall, the best results follow keeping them in a house and ventilating precisely as in the case of early vineries.

Young Vines.—Vines raised from eyes of the current year will soon have filled the seven-inch pots in which they are growing with roots, and the pots may be raised gradually above the plunging material, when the roots will require more frequent supplies of water and feeding with diluted liquid manure. If too crowded, remove the more forward specimens to other positions where they can have the full benefit of sun-heat with plenty of light and more air day and night as the canes show signs of ripening. Canes intended for planting may be stopped when they have made six feet of growth. It is very important to have a few plump buds at the base of the vine. All laterals except a few at the top should be kept pinched at the first leaf.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brockton Hall, Hertfordshire.

Cyclamen latifolium.—Young plants raised from seeds sown last August should be ready for their final potting, but before carrying out this operation see that the plants are free from mite and aphid. Thrips are also troublesome to *Cyclamens*, and where either of these pests is detected it will be necessary to dip the plant twice in nicotine emulsion, using the specific strictly in accordance with the makers' directions. The rooting-medium for this potting may consist of fibrous loam, leaf-mould and manure from an old Mushroom-bed mixed with old bricks broken up very small, and a moderate sprinkling of rough sand. It is important when potting not to bury the corms too deeply; one half of the corm should be above the surface when the work is completed, otherwise damping of the flowers in the autumn will follow. Cold frames may be used for the growing of the plants for the next few months, but some prefer growing them near the roof-glass in a light, span-roofed house, where the air circulates freely. The young plants should be shaded from bright sunshine during the hottest part of the day, and where this can be done by a moveable shade better results will be forthcoming than using permanent shading. Copious supplies of rain water are needed at the roots when the receptacles are well filled with the latter.

Euphorbia pulcherrima (syn. Poinsettia).—When the plants have filled their receptacles with roots, transfer them to larger ones to suit the various stages of growth. The compost may consist chiefly of good, open loam, with a little spent Mushroom-bed manure and sand added to keep the texture open. The young plants should be grown in plenty

of heat and moisture in their early stages, but once they are sufficiently advanced to be potted finally they should be gradually hardened and grown under cooler conditions for the next two months. *Euphorbia jacquiniæfolia* requires much the same treatment as the *Poinsettia*. Continue to propagate cuttings of both species as they become available; these cuttings will make useful plants for decorating purposes if grown in small pots.

Perpetual Carnations.—The latest batch of these plants should be ready for placing in their flowering pots. The compost recommended in a previous calendar may be used, and it should be in a suitable condition to allow it to be made tolerably firm by ramming. The earlier potted plants may now be stood out-of-doors on a bed of ashes; before doing this, we erect a skeleton frame to protect the plants from heavy rains. Although Carnations should never be allowed to suffer from lack of moisture at the roots, an excess of water at this stage of growth would prove very harmful to them. Spray the plants in the evenings occasionally with weak soot-water to keep red spider in check.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Pruning Flowering Shrubs.—It is very important to prune flowering shrubs at the proper time to obtain the best possible display of flowers; in fact, pruning at the wrong time may, in some cases, entirely ruin the floral display. Flowering shrubs generally fall into three classes, one in which no regular pruning is required beyond the cutting out of dead wood and an occasional thinning of the shoots to prevent over-crowding; it is wise to attend to this every year and not allow the plants to get out of hand; the second class includes all shrubs which produce their flowers on shoots made the previous season; all such shrubs should be pruned so soon as possible after they have finished flowering, and thus allow them plenty of time in which to make and mature the new growths. The pruning in this case usually consists in the removal of all or a portion of the old flowering wood, always bearing in mind to allow for the necessary extension of the plant or plants being dealt with. Good examples of this class of shrub are *Prunus triloba* var. fl. pl., *P. Persica*, all the *Ceanothus* that flower during spring and early summer, *Philadelphus*, *Dier-villas*, etc. The third group includes shrubs which flower on the current year's wood; these should be pruned during the spring just as they are starting into growth. Good example of a popular shrub in this group is *Ceanothus Gloire de Versailles*. Close observation soon enables the grower to determine the best way and the proper time to carry out pruning operations.

Lupinus arboreus.—The Tree Lupin and its fine white variety, *Snow Queen*, are specially suited to planting in hot, sunny situations, on poor, stony ground; in the warmer parts of the country they quickly make very large specimens. These Lupins are easily raised from seeds and may also be increased by means of cuttings. Nearly all the perennial *Lupinus* are very suitable for planting in large masses in the semi-wild parts of the garden.

Propagating Hardy Shrubs.—The general run of hardy flowering shrubs may be propagated from cuttings inserted out-of-doors, or in cold frames during the autumn. Most of them can, however, be successfully propagated indoors at this time by means of half-ripened shoots inserted in a close propagating case, using for this purpose the firmer, twiggy, side growths when they are about four inches in length. The cuttings may be inserted in pots of sandy soil, or dibbled into specially prepared beds. By propagating in this way a season is gained, for in most cases so soon as the cuttings are rooted and hardened off they may be planted out in the reserve garden, and some of the plants will be large enough to be planted in their permanent quarters during the autumn or following spring.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Winter-flowering Plants.—All plants, such as *Gesnerias*, *Browallias* and *Begonia Gloire de Lorraine*, which are required to give a display of flowers during winter should now be well-established, and if necessary, repotted and kept growing freely. Any flowers should be picked off as they appear. Winter-flowering *Pelargoniums*, which should now be in six-inch pots, may have any straggling points removed in order to keep the plants compact. When well-rooted in their flowering pots, they should be given assistance either by top-dressing them, or feeding the roots with diluted liquid manure. Cuttings of *Coleus thyrsoideus* may still be inserted to produce small plants, and the earlier

around as growth proceeds with soft, green twine. In the south, many growers stand the plants in the open, but this is not recommended for northern growers; an airy house, without fire-heat, is undoubtedly the best place in which to grow them during the summer, where they can be regularly attended to and when necessary fumigated to keep them free of insect pests. Older plants in the Carnation house are now producing large quantities of flowers, and a good deal of time is required to remove the side-shoots, and keep the plants well supported. Top-dress the roots at regular intervals with a Carnation manure to keep the plants vigorous and healthy.

Early Seed Potatoes.—The earliest Potatoes are quite ripe enough for lifting, and in order to ensure a supply of seed tubers for next season

FIG. 2.—STANDARD TREE LUPIN AT SANDILANDS, BOAR'S HILL, OXFORD.

(see p. 6.)

rooted plants repotted singly. When the latter are again growing freely, pinch the shoots to ensure shapely and bushy specimens. *Cinerarias* and *Primulas* are ready for transferring to four-inch pots, where they will grow satisfactorily in a cool, shaded house.

Perpetual Carnations.—The plants which were transferred to six-inch pots early in June are growing freely, and the grower whose object is to produce these valuable flowers in mid-winter should continue to stop the leading shoots of certain varieties until the middle of July, while other kinds of a stockier and slower growth should be allowed to develop from now onwards without interference, as they take considerably longer time to produce flower buds. The plants should be staked at an early date in order to keep the growths erect, and while many inventions are put forward for this purpose, few of them answer so well as the old method of placing three stakes in each pot, and these looped

a selection from the very best cropping roots should be made, and the sets placed direct in boxes or seed trays. It is sometimes recommended to leave the tubers in the open air, but when the sun is scorching hot much damage may be done by leaving them fully exposed, as the skins harden too rapidly; samples shown to me last season were rendered useless, or nearly so, by leaving them fully exposed, and it is better to set them in a shady place to allow the greening process to develop gradually. The borders of these early Potatoes will be in good condition for several catch-crops, and any of the following may be planted with every prospect of success, viz., Vegetable Marrows, Dwarf French Beans, early Carrots, early Beet, Spinach and Turnips. Should the soil be very dry at sowing or planting time, the drills should be well-watered before the seeds are inserted; the dry soil which covers the seeds will help to conserve the soil moisture until germination has taken place.

FLORISTS' FLOWERS.

BORDER CARNATIONS.

THERE are generally new varieties of Carnations to be seen on some of the stands at the Chelsea Show, which are intended for distribution in the autumn, and although there were fewer this year than is usually the case, I noticed one or two white ground Fancies which will probably please those who admire these beautiful florists' flowers.

The one I liked best, named Scarlet Lancer, is a fine, bold flower, of excellent shape, profusely marked with scarlet, on a strong, upstanding stem. This variety should prove equally good for pot or border cultivation. Another named Bookham Beau, has markings of a shade somewhat difficult to describe, magenta-crimson, perhaps, describes it best.

The variety Fred Archer, which was sent out recently, is a strongly marked rose variety; I do not remember having seen it at an exhibition before. It would, of course, be impossible to include every fresh variety raised in the first class novelties, but I sometimes find a first-class variety slips into the general list of a catalogue, and a keen collector will realise the fact.

Dorothy Murray, which was awarded a First Class Certificate last summer at the Carpenters' Hall, London, is another choice flower in this class. The crimson-purple markings are not heavy, and although not over large, the flower is of very good shape. To those who like dressed blooms it will appeal greatly, as it lends itself admirably to dressing.

There will, no doubt, be seedlings of all classes at the summer show, but the white ground class has been augmented recently by more outstanding varieties than any other, except the Fancies—yellow grounds as good as Viceroy are always in demand—but this is a very strong class as it stands, and raisers naturally incline to send out varieties in other classes to bring them up to the same strength. The pitfall which seems specially to apply to white grounds is the danger of too-much-alike varieties, and there is no doubt it is hard to avoid. There are certain very distinctive flowers, such as Ravenswood, Steerforth Clove, Fair Ellen, Mrs. Hawksbee and Mrs. E. Charrington, to quote at random, but there is so very little colour scope that in some cases no one but a Carnation specialist would be able to differentiate the varieties.

Raisers certainly benefit by sending out flowers with decided and unique markings, for the ordinary amateur requires varieties he can place at a glance, also those which will contrast, and be effective in the open border, while a collector will not discard an established favourite for a novelty with practically similar colouring, unless it is, obviously, very much superior in other respects.

There is so much more scope for colour combinations in yellow ground Fancies that, as a rule, sameness is avoided, also the grounding is of varying shades—maize, buff and apricot, besides all tones of yellow. A pleasing novelty in this class is King's Jester, buff, edged and marked red and lavender. It was only sent out last autumn, but I saw the plants in bloom previously, and was much impressed with them. My own layers have grown well and thrown up strong flower spikes. Duke Ivor, a very handsome bloom, with heavy carmine-crimson markings of the Viceroy type, is another newcomer which should prove welcome to those who exhibit. It is curious how certain varieties are always exhibited; Lieut. Shackleton, Viceroy, Pasquin, Elizabeth Shifner, Fair Ellen, Mrs. E. Charrington, Linkman and Gordon Douglas being certain to appear, age not seeming to affect the constitutional vigour of those sorts which have been with us many years—for plants, like people, have different terms of life, and Carnations are very variable in this respect. I find some varieties petering out after a few years, into very feeble specimens. One can understand how it is that Lieut. Shackleton and Elizabeth Shifner retain their place, because they are still unique in colouring, and I do not know a more beautiful flower than the former. Light soil suits this variety excellently, and amateurs who can grow it in the open border

will be repaid by immense blooms. Bookham Belle and Highland Mary are two other very perfect and lovely sorts which intending growers will do well to note.

Among selfs a good crimson is Joan Wardale, particularly in soil on the heavy side, and those who require a lovely salmon-rose should grow Nautilus. It is a really good variety, and splendid for the border or exhibition, growing very strongly. It promises to prove a standard variety in its colour. Delicosa is another perfectly-formed self flower of soft lilac-rose colouring and a plant of good habit.

The season for exhibiting, with all its hopes and fears, is with us, and those who are showing for the first time often find a difficulty in arranging their vases so that the colours harmonise, and show to the best advantage.

It is not wise to put white next to dull crimson following on with a shade like E. G. Quick, for instance. There is no relief—scarlet, mauve, rose, crimson, yellow, purple, apricot could follow, while white, or other shades, may be contrasted according to their tones. Dissatisfaction is often expressed by exhibitors at their non-success, and in some cases it is partly their own fault, for tasteful staging appeals to the judges, and where other things are equal, they will naturally award the prizes to those who have studied this art.

And here I should like to say a few words about the selection of judges for particular flowers. I think, and I feel sure the majority will agree, that a judge of Carnations should be a practical grower. Only in this way can they understand or appreciate the true form and colour which should pertain to each variety or be able to allow for certain differences which are liable to occur in different circumstances, or the difficulties which have been overcome in bringing some blooms to perfection. True judging of any flower can only be gained by knowledge of its habits and peculiarities J. B. Wells.

FLOWER GARDEN.

TREE LUPINS.

THE Tree Lupin illustrated in Fig 2, represents a successful effort on the part of Mrs. Grierson of Sandilands, Boars Hill, Oxford, to make *Lupinus arboreus* live up to its specific name. There are many gardeners who, though they appreciate fully the beauty of the Tree Lupin at flowering time, have abandoned, albeit reluctantly, the cultivation of this fine garden plant. Brave and opulent though their showing be at flowering time, the dishevelment which follows when the branches bend down and break with the ample load of pods, makes the plants unsightly. Even though the bushes are severely pruned after flowering, the unsightliness is but little less and, moreover, the plants, never long-lived, seem to resent the heavy pruning which the gardener who cares for tidiness is apt to give them.

When, however, the Tree Lupin is trained as a standard, these disadvantages do not obtain, for the branches may be shortened so soon as the full flowering is over, and so treated the plants have a less desolate appearance in autumn. The prolific self-sowing of the plant provides, moreover, for relays to take the place of those which fail to survive the winter.

THERMOPSIS LANCEOLATA.

THIS useful, early-flowering perennial is a native of Siberia and Alaska, and yet, despite its obvious hardiness, it has the bad habit of dying out suddenly, which no doubt accounts for its comparative rareness in gardens.

Its closely-packed racemes of large, golden, pea-like flowers are produced at the top of erect, simple or branching stems, which are clothed with alternately disposed digitate leaves borne on short stalks up to one inch in length, at the base of which are two large, ovate stipules.

The leaves are composed of three cuneate-lanceolate leaflets, about two inches in length, and of a light green colour, the undersurface and margins being furnished with silky down.

This *Thermopsis* should be planted in deep, light and well-drained soil, in a sunny situation, under which conditions it will produce an abundance of growths, terminated by flowers during May and June. It spreads by means of underground runners, and though free of growth when established, it does not transplant well, so that the raising of fresh plants from seeds is preferable to division. It is figured in *Bot. Mag.*, t. 1,389, as *Podalyria lanceolata*, but both illustration and description by no means do the plant justice.

DORYCNium HIRSUTUM.

SOMETIMES referred to as *Lotus hirsutum*, this is a useful plant for hot positions and light, sandy soil. It is a Leguminous plant of semi-shrubby habit, forming a low, close-growing bush, about one foot high, the whole plant being densely covered with soft, silky tomentum. The leaves are clustered closely together on the stems; they are trifoliate, and have at their base two stipules similar in appearance to the leaflets, which are ovate, sharply-pointed, and light greyish-green in colour.

The flowers are produced freely from June to August in terminal heads on slender stems about two inches in length. The corollas are white or tinged with pink, and are twice the length of the red-tinted calyces. In favourable seasons a quantity of seed is produced, providing the best means of increasing this attractive plant. A. G. F.

ANCHUSA ITALICA.

THERE are several varieties of this popular plant, including the well-known Dropmore variety, Opal and Pride of Dover, as well as a white-flowered form.

The blue varieties are unrivalled for grouping in the mixed border, or for furnishing large lawn beds, while bold groupings are very effective in the semi-wild parts of the garden.

Naturally, this plant, or at least the varieties, are, especially on heavy soils, short-lived perennials, and frequent complaints that they die out is due to the fact that they are not frequently propagated by means of root-cuttings. Root-cuttings will succeed at almost any time, and if they were not secured during the autumn, when the plants were being moved, they may be obtained when the plants have finished flowering and are being cleared from the beds. Pieces of roots, about three inches in length, are suitable and should be laid in closely in boxes of sandy soil. On light, sandy soils they may be lined out direct in the ground. The stock raised in boxes should be planted out so soon as they start to grow; by autumn they will be ready for transference to their flowering quarters. C.

BULB GARDEN.

LILIUM CONCOLOR DROPMORE VARIETY.

THE lovely miniature *Lilium concolor* is well adapted for growing in cool and shady spots on the rockery. The type bears orange-coloured flowers, but is undoubtedly superseded by the Dropmore variety (Fig. 1) which received the R.H.S. Award of Merit on June 21, when exhibited by Mr. Amos Perry, Enfield.

The flowers are supported on stout stems from one-and-a-half foot to two-and-a-half feet tall, each inflorescence bearing from three to five brilliant, scarlet-orange, upright flowers in terminal heads.

The conical-shaped bulbs are each capable of producing from two to four, and occasionally five, spikes of flowers. The irregular, spreading, lanceolate leaves are deep green and slightly pubescent.

The variety promises to prove one of the most decorative of hardy border Lilies. It was raised by a well-known Canadian amateur, and the stock came into the possession of Mr. Perry in 1924. W. L.

SNOWDROP SEEDS AND SEEDLINGS.

THE notes that appeared in the issues of the *Gard. Chron.* for March 26, p. 210, and April 16, p. 272, indicate that interest in the question of the seeding or non-seeding of Snowdrops is still keen and unsatisfied. After the publication of my notes (*Gard. Chron.*, January 30, 1926, p. 84), I had hoped to see the observations of others recorded. Instead, a number of

and sown last year. This evidence has been returned to Mr. Harrison for his inspection.

In a former note I mentioned that bulbs sent me by Mr. Harrison and *Formakin*, in 1925, had been planted in lines, and that half was to be left to insect or wind fertilisation, and the other part was to be, if possible, artificially pollinated, in addition to any insect or wind fertilisation. This I tried by inserting a fine, camel-hair brush into the flowers produced on the nearer part of the lines. The bulbs sent by Mr. Harrison were the ordinary *G. nivalis*,

seed has a long or a short period of viability, or whether in this matter also we have more to learn. The seeds from the capsules sent to me in 1926 are still unsown. They will, I hope, be tested against 1927 seeds, sown as soon as gathered. I find in some notes, written in October, 1905, by the late Mr. W. B. Boyd, of Faldonside, Melrose, the following:—"I may mention that the garden and grounds at Ashiestill are among the few places in our part of the country where Snowdrops come up freely from self-sown seeds, and the soil is a heavy clay. This is all the more remarkable since in my own garden at Faldonside, where the soil is very similar, and a great number of varieties are grown, I very rarely see a self-sown seedling from a Snowdrop."

During the last seven years, I have gathered each year a few Snowdrop seeds and sown them, so soon as gathered, in a pocket in my rockery, always in the same pocket. It lies about ten inches above the adjoining path, so it is well-drained and the soil becomes very dry in summer. Last year a few of the resulting bulbs flowered. This year more have done so, and six capsules have been formed. As a matter of interest, I lifted, on May 6, some of those seedlings. The enclosed is a photograph (Fig. 3) of all the seventeen plants growing in a space of six inches by six inches, arranged in order of size of bulb. I think it is clear that Snowdrops both produce seeds and grow from seeds fairly freely. The two bulbs at the right of the illustration are splitting up into two and three bulbs. The five at the left are seedlings of this year, with the seed-cases still attached to the stems, except in the case of No. 2 from the left. Measuring from the base of the bulb in each case, the seed-cases are from $9/32$ to $17/32$ of an inch up the stem. The illustration in Fig. 4 shows the seed-cases more distinctly. Why Snowdrops should in some districts fail to produce viable seeds or should fail to grow freely from seeds is still not clear. So far, I have been unable to arrive at a more satisfactory conclusion than that reproduction by seeds depends on climatic conditions, particularly rainfall, as suggested in your issue of January 30, 1926, p. 83.

One other point is suggested by the correspondence received. Most plants, the seed behaviour of which I can recall, keep their flower stems green until the seeds are ripe and shed, but the Snowdrop does not do this. In the words of one correspondent: "the Snowdrop capsules,

growers sent me green capsules. These were kept for some weeks and were then depodded, and I regret that the thought of recording the percentage of seeds in them did not occur to me until too many lots had been depodded. Roughly, my observations are that whether the capsules were from Hartland, North Devon; Ro-Wen, North Wales; Snittlegarth and Blaithwaite, Cumberland; Monreith, Wigtownshire; Culzean, Ayrshire; or gathered here, there appeared to be little difference in the size of the seeds, but the size of the capsule and numbers of seeds in a capsule varied greatly. For instance, the capsules from Culzean contained from one to six seeds (one pod contained nine seeds), with an average of 4.19; Snittlegarth capsules contained from one to four seeds, average 2.27; while capsules grown here from roots of *G. nivalis*, sent from Culzean in 1925, produced from two to five seeds, with an average of 4.7. This year, this last group of roots has produced a very large number of capsules, and on examination many have been found to contain twelve seeds. It is still uncertain whether all of these will ripen.

Last year I had the opportunity of visiting a wood at Snittlegarth, in Cumberland, where formerly I had known the ground to be white with Snowdrops each spring. When I saw it in late May, the foliage had, to a large extent, died away, and comparatively few capsules were obtainable. On proceeding to lift a clump for examination of the bulbs, I found that many of these had been apparently squeezed up to the surface and very small effort was required to dislodge a few. Doubtless this dislodgment of bulbs is of annual occurrence by the scratching of birds and other natural means, and so the bulbs become dispersed over a greater area. The appearance of the mass of bulbs was quite different from anything I have yet found here.

Mr. Harrison has this spring sent me from Culzean a couple of clumps of *Galanthus nivalis*, as lifted. These also show the appearance of bulbs squeezed to the surface, but they also show unmistakable evidence that some of the bulbs in the clump are from seeds produced

while those sent by *Formakin* were a later variety of *G. nivalis*. When the former were in full bloom the latter were little more than showing the white of their flowers. This gave opportunity for insect pollination over a somewhat lengthy period, but neither from this

circumstance nor from the attempted artificial pollination, could any definite increase of capsule formation be noted. This year, those sent by Mr. Harrison started to flower on New Year's Day, and capsules have been formed freely on them (as already noted), also on the late variety from *Formakin*. This seems to be a year of plentiful production of Snowdrop seed in our locality.

Mr. Harrison's failure to get apparently good seeds to germinate even when gathered and hand-sown, raises the question whether Snowdrop

from my observation, don't open through drying but rather through swelling with dampness. Examining my Snowdrops, *G. nivalis*, in the first week of May, I find that in every case (except the late-flowering variety) the flower stem has withered away, leaving large green capsules detached from the flower-stems, on the surface of the ground, under a network of withering and drying leaves. The seeds in these severed capsules are still of milk-white colour but not yet of full size, as when ripe. So far, observation here agrees with that of my corres-

FIG. 3.—SEEDLING SNOWDROPS.

The five on the left are seedlings of this year.

FIG. 4.—SEEDLING SNOWDROPS SHOWING THE SEED CASES.

pendent, but whether the bursting comes from dampness or ripening decay, I cannot say. My recollection seems to be that the capsules do not become larger after severance, but that in a few weeks they become yellow, and the outer case then gradually opens and sloughs away, leaving the ripe seeds on the ground. This shedding of unripe capsules has been remarked on by several correspondents. *P. Murray Thomson, Hereford.*

ALPINE GARDEN.

GENISTA TINCTORIA PLENA.

ALTHOUGH the double Dyer's Broom has been cultivated in our gardens for many years, it still retains its popularity as an almost indispensable subject for the good-sized rockery, as well as for the large rock garden.

It is a pleasing plant when in full bloom, with its graceful, double flowers of bright golden yellow, and is an excellent subject for trailing over a bank or large stones; it is not so rampant in growth as to become troublesome, and may be kept cut back if desired, while its height is only about six inches. It is also an excellent subject for covering a rough bank.

The plant usually flowers in July and August, but in some seasons is a little earlier, and the season may be extended beyond August, this depending on its position and the climate of the district. This Broom may be planted now to bloom next season, or the planting may be deferred until spring. I prefer planting pot specimens rather than those from the open ground.

PATRINIA PALMATA.

PATRINIA palmata is one of the most satisfactory and distinct members of the genus, but is seldom seen in gardens, and is not plentiful in nurseries. It is a dwarf plant, suitable for the rock garden or moraine, with distinct, palmate foliage, and loosely-arranged flowers of bright yellow.

The late Mr. Reginald Farrer, who had strong likes and dislikes to certain plants, thought very little of the Patrinias, apparently owing to the likeness of some of them to the Valerians, and *P. palmata* shared the depreciative remarks he made about the taller members of the race. It is true that *P. palmata* will grow about a foot high in rich soil, whereas it is much prettier when dwarf. In poor, dry soil in the rock garden its height may not exceed six inches, and in a dry moraine I have had it less than six inches high and quite pretty.

The moraine was composed mainly of whinstone chips with some old lime rubbish and a little sandy soil below as a rooting medium. In my garden *P. palmata* has increased slowly at the root; it is pretty in summer, associated with early Saxifrages, Drabas, etc., and succeeded them in time of blooming. It may not be a first-class plant, but it has its merits, not the least of which is its hardiness.—*S. Arnot.*

THE ROCK GARDEN IN SUMMER AND AUTUMN.

WHEN spring is over, most rock gardens lose their brightness and become dull and uninteresting. Here and there a plant may be seen in flower, but there is no reason why a rockery should not be bright with colour in July, August and September. It is because the later-flowering alpine plants are too little known that the average rock garden is interesting, perhaps, for only six weeks of the year.

Recently I saw a rock garden that had been made by a prominent firm of rock gardeners. It was very pretty; and everything was in flower, or rather, nearly everything, for early Saxifrages and a few other things had already bloomed and passed. I wondered what this particular rock garden would look like towards the end of August and onwards. All the plants that were flowering would be over and, as there was nothing to replace them, this rock garden would be very dull later in the season.

Many imagine that a rock garden is of necessity a spring garden, but it is quite possible to lengthen the season when flowers are available by three months.

Some of the plants enumerated below are late-flowering, others commence to flower early, and continue to bloom throughout the summer and into the autumn.

One of the most useful families of late-flowering subjects is the *Oenothera* and undoubtedly one of the finest species is *O. pumila*. This plant provides the richest of yellow flowers in a season when alpine plants with yellow flowers are very few. The habit of the plant might be described as "sprawling," and its beautiful flowers are produced from July until August. Another desirable *Oenothera* is *O. speciosa rosea*. This plant grows erect, about eighteen inches high. It produces large flowers of an exquisite shade of white and pink from July till September.

O. missouriensis is a creeping plant and only four inches in height. It will soon cover a piece of ground where little else would grow. Like the others, it produces flowers in great freedom from July until September. The individual blossoms are four inches in diameter, and of a very bright yellow. This admirable plant is not common, probably because it is not often seen at shows, it being rather difficult to exhibit.

Zauschneria californica comes into flower in August, and continues blooming until October. Strange though it seems, this Californian plant is not popular, and yet it is very pretty. It grows freely in hot, dry situations and attains a height of one foot. The leaves are pretty and inclined to be hoary. The quaint, tubular flowers are brick-red and very numerous produced.

Origanum Tournfortii is a very charming and graceful little plant. The thin, wiry stems bear pale mauve flowers from late July till September. The blossoms are rather difficult to describe, but they remind me somewhat of *Briza maxima* (Quaker Grass).

There is no reason why some of the dwarf Asters of the *Amellus* section should not be used on the rockery, for they make a splendid display of colour during the autumn. Useful varieties are: *Framfieldii*, *cassubicus*, *Mrs. Perry* and *rubellus*; all these varieties are two feet in height.

Aster Thomsonii is a fine plant producing a wealth of rich mauve flowers from August till October; the colour is most beautiful in the early morning.

Among late-flowering Gentians are *G. Andrewsii*, dark blue; *G. Farreri*, bright blue, with a white throat; and *G. sino-ornata*, that produces large, bright, blue trumpets from August till November.

There are countless other plants, perhaps not all strictly alpine, but, nevertheless, very suitable for the object we have in view; the following is a short list: *Potentilla Tonguei*, *Dryas octopetala*, *Ceratostigma Willmottianum*, *Aethionema iberideum*, *Hypericum fragile*, *H. aegyptiacum*, *Linaria pallida*, *Lysimachia nummularia variegata*, *Meconopsis cambrica* fl. pl., *Mimulus cupreus* vars., *Sedum kamschatkense*, *S. pulchellum*, *S. Ewersii*, *S. Sieboldii*, *Silene Schafta*, *Teucrium Chamaedrys*, *Thymus Chamaedrys*, *Tunica Saxifraga* fl. pl., *Verbena chamaedryfolia* and *V. venosa*. *John Birkentall, Taplow.*

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM CURTISII.

THIS species of the large genus *Cypripedium* is indigenous to Sumatra and requires to be grown in a temperature ranging from 65° to 70°. The livid-coloured flowers develop during the late spring and summer. The dorsal sepal is green and purple veined, and the margin is white. The lip is comparatively large and dull, purplish-brown in colour. The petals are green veined, spotted with purple, and ciliate on the surface and around the margins.

The variety *Sanderæ* is similar in form, but

a dull yellow colour. Both have variegated leaves, and in common with all *Cypripediums* with this distinct feature, it is necessary to modify the compost, and include rather less loam fibre than is used for the green types.

When the plants are newly-potted, a moist atmosphere is required, and this should be maintained by syringing between the pots on frequent occasions. *J. Robbie.*

CYPRIPEDIUM SPECTABILE.

At a recent meeting of the Royal Horticultural Society, at Vincent Square, some of the visitors were charmed with the beauty of *Cypripedium spectabile* in several exhibits. But although the plants were worthy of admiration, the lover of hardy terrestrial Orchids should go to Kew to see *Cypripedium spectabile* at its best. By the side of the tiny rill in the Rock Garden at Kew there is a magnificent plant, over two feet high, full of vigour, and bearing unusually large flowers, the milk-white standards and rose-flushed lips being strikingly beautiful. Mr. Irving seems to have a very happy hand with the terrestrial Orchids for he is also exceptionally successful with the handsome Madeira Orchid.

Autumn is the best season to plant *Cypripedium spectabile*. Roots should be secured early and planted in a bed in a low-lying portion of the rockery or border. Remove the soil to a depth of one foot or a little more, and place a layer of broken bricks in the bottom of the hole to ensure good drainage; then fill the hole with a compost, consisting of rough peat, fibrous loam, decayed leaf-soil, sharp sand and charcoal, with the addition of a little chopped Spagnum-moss to assist in retaining moisture at the roots.

When planting, spread the roots out horizontally so that at the completion of the operation the crowns are two inches or three inches below the surface, and work the soil well in between the roots, pressing it firmly with the fingers. Care must be exercised not to injure the crowns. A piece of coarse mesh wire-netting placed above the ground where the plants are, and secured to stakes, will effectually prevent birds from scratching away the soil. *T. H.*

CYPRIPEDIUM HEDLEY.

THIS is a hybrid from *C. Moonstone* × *C. Nirvana*, and flowered recently in Mr. Cookson's collection. The dorsal sepal is pure white, excepting for a small area of green at the base, where there are some slight brown markings. The well-shaped petals are greenish-yellow shaded with a brown suffusion, and have white tips. The lip is bright greenish-yellow, suffused with brown markings. *H. J. C.*

INDOOR PLANTS.

CYCLAMEN LATIFOLIUM.

THOUGH it is generally accepted that the *Cyclamen* is one of the best greenhouse plants for winter and spring flowering, it is surprising what a large number of gardeners neglect to cultivate it. Whatever may be the cause, it certainly is not because the *Cyclamen* is difficult to cultivate, for with the aid of a greenhouse and a cold frame or two, *Cyclamens* may be grown as easily as most greenhouse plants, providing the treatment is suitable.

From a sowing made in January it is possible to obtain good flowering plants within the year, but however good these plants may be, I doubt if they are ever so strong as those raised from seeds sown during late summer and autumn, for the extra growth made in those few months makes all the difference.

Two sowings should be made, one in early August and one in mid-September, and the plants of these two sowings should be treated as two distinct batches all through, the result being a valuable lengthening of the flowering period.

The soil for sowing should contain at least

one third of its bulk of leaf-mould, the rest fibrous loam which has been passed through a half-inch sieve, mixed with a liberal amount of coarse sand, for it is necessary to have soil that is porous. Pans are better than wooden boxes for raising the seeds in, but whichever is used, the drainage should be ample.

When filling the pans, make the soil only moderately firm, and place the seeds, one by one, about half-an-inch apart, covering them with about an eighth-of-an-inch, or even a quarter-of-an-inch of fine soil. If the compost is moist before the seeds are sown, water will not be needed for a week or so, as a sheet of paper placed over each box or pan will prevent it drying out, but great care must be taken to make sure that the soil does not become dry, as if this happens after the seeds have started to germinate it will be fatal to success. The seeds should be germinated in a temperature of about 60°, and a moist atmosphere is essential.

Prick off the seedlings so soon as they can be handled, though it is wise to retain the seed-pan for some time, as germination of *Cyclamen* seeds is somewhat spasmodic, and the grower who is hasty may lose some of the best plants. The soil in which the seedlings are transplanted should contain less leaf-mould than the previous mixture, and should be pressed a little firmer. After the roots have taken to the soil, encourage the plants to grow strongly, by admitting fresh air on all possible occasions. The winter temperature should range around 50°, though if it falls to 45° no real harm will ensue.

In early spring the plants will be well rooted in sixty-sized pots if growth has been generous, and this is the dangerous stage, for insect pests will appear with the first hot days, including aphids, red spider and thrips; therefore it is well to be prepared. A weekly syringing with a weak insecticide is usually effective in combating these pests, though it is well to bear in mind that healthy plants resist disease to a remarkable degree. A frame is a suitable place for these young plants once danger of severe weather is over, and if closed early and the plants well syringed, there should be no danger after about mid-April.

In May or early June the plants should be potted for the final time; forty-eight-sized or four-and-a-half inch pots are quite large enough for all ordinary purposes. The soil should be rich; a suitable compost may be prepared as follows:—Three parts yellow, fibrous loam one part leaf-mould, one part rotted manure, with sharp sand or brick rubble added to ensure the texture being open. Add a little crushed charcoal, and if the soil is not naturally rich mix a little quick-acting fertiliser with it.

In potting, do not make the soil too hard, and, most important, do not bury the corm more than half its depth. From now onwards a cool, shady frame is the best place in which to grow the plants, and admit air freely, though always try to preserve a genial atmosphere. If the pots are plunged in ashes or fibre, the plants usually do well, but watering must be done with the greatest care, for though the *Cyclamen* needs plenty of moisture, an excess is harmful.

August should see the plants strong and growing fast, and by September they should be placed in a glasshouse. Pick out those that promise to flower early, and encourage them to develop by feeding the roots with liquid manure, also maintain a moist atmosphere. In the period of short days when light is so valuable, it will be a great advantage to stand the plants on shelves near the roof-glass to obtain early-flowering batches.

There is now such a variety of colours in this plant that one hesitates to recommend any special variety, but I consider the best red is *Firefly* and *St. George* the best salmon, with *White Swan* the best of the whites. The varieties with silver leaf markings are delightful and in these there is now quite a wide range of colourings. Fringed varieties are to be had in most colours, and the best of this type is *Fringed Pink Pearl*.

Good, generous culture and keen watchfulness on the part of the cultivator are needed to grow *Cyclamens* successfully; when the cultivation is perfect the plants will respond as few other winter-flowering subjects do. J. S. D.

TREES AND SHRUBS.

CLEMATIS ARMANDII.

THE plant of *Clematis Armandii* illustrated in Fig. 5 has grown from a seedling raised in Sir Thomas Hanbury's garden at La Mortola from Chinese seed. Lady Thiselton-Dyer planted it by the side of the Loquat, which flourishes on the south-west side of our house; this has given it fostering protection in its youth, and the necessary support in its maturity.

Our plant is thought to be a better strain than usual. We supplied cuttings to Sir Edmund

fragrance, somewhat suggestive of the later-flowering *M. grandiflora*, but without its pungency. So far, as I have seen, in various parts of the country, the Swamp Bay, as the Americans so term *Magnolia glauca*, does not produce many flowers at a time, but its blooming continues from early June until well into the autumn, and during this considerable period one can nearly always find at least a few blooms open. The globular flowers, which are not so large as those of *M. conspicua*, are creamy-white when first open, but they are often lightly tinted with green on the outsides. In the eastern United States this species is said to

FIG. 5.—CLEMATIS ARMANDII IN ASSOCIATION WITH ERIOBOTRYA JAPONICA.

Loder more than once for *Leonardslee*, but they failed to strike. Mr. Hiatt Baker tells me that he has been more fortunate at Almondsbury. W. T. Thiselton-Dyer, *The Ferns*, Witcombe, Gloucester.

MAGNOLIA GLAUCA.

THIS is not a showy *Magnolia*. It does not, like *M. conspicua*, *M. Soulangeana*, *M. Lennei* and others of the popular earlier flowering *Magnolias*, flaunt its blooms to the skies. One has, almost, to search the slender trees for their flowers, but how delicious is their

grow occasionally to a height of fifty feet, but in this country a tree of twenty feet would be considered quite a fair specimen. A. C. B.

GENISTA CINEREA.

At the time of writing, June 18, this plant is the glory of the garden, great masses of it, fifteen feet to twenty feet in height, being covered with its golden yellow flowers. It is surprising that this species is not more generally planted, as it may be used either for furnishing a large lawn bed or for planting in the wilder part of the garden. J.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.**

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the **PUBLISHER**, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the **EDITORS.** The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc. but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

WELWITSCHIAS AND OTHER PLANTS OF DAMARALAND.

IN view of the fact that Damaraland, South-west Africa, is now a territory under the mandate of this country, it seems a pity that greater facilities are not afforded for British botanists to travel there and collect some of its botanical treasures. It is especially deplorable that the plant of chief botanical interest, viz., *Welwitschia mirabilis*, Hook. f., should remain almost unknown in the flesh to our botanists and horticulturists. The British botanists who have seen this plant growing can, I believe, be counted on the fingers of one hand.

One of the reasons for this is that the two main regions where the plants grow in abundance are difficult of access, viz., Haikamchab, where my late friend, H. H. W. Pearson, obtained the material for his classic researches, and the district, some ten miles further north, and about a mile south of where Welwitsch railway station formerly stood, where I found hundreds, if not thousands, of splendid specimens growing mainly in the one hundred yards wide, dried up bed of a tributary of the river Swakop. As the railway line which traversed the district where the *Welwitschias* grow was permanently closed in April, 1910, a visit to these plants is rendered very much more difficult than formerly. In view of their comparative inaccessibility, and the large numbers in which they occur, there is really small need at present for the official preservation and protection which is afforded them. Although Pearson was at Welwitsch, he was only aware of the dozen or so rather poor specimens growing close to the station. It was apparently these plants also which the American, W. A. Cannon,* noted, as he speaks of seeing only five specimens, and his photos are of plants with much-split leaves, and hardly any stem showing above ground. From April 4 to 15, 1910, I stayed at Wel-

witsch station, some forty miles east from the coast, and almost daily wandered amongst and closely observed, hundreds of beautiful and, in many cases, very old specimens of *Welwitschias* growing in the river bed and on the low granite kopjes. The stems of several plants stood over a foot high. The crowns of many were enormous; one or two I measured were twelve feet in circumference. Lying full length on one of these crowns, my head and feet were easily included within it, giving it a measurement, therefore, of six feet across! The two leaves, of a beautiful grass-green, were, for the most part, except at the tips where they trailed on the ground, quite entire and unsplit. Some of them were two feet across. Beneath the leaves the sand was slightly moist.

FIG. 6.—WELWITSCHIAS GROWING WILD IN DAMARALAND.

Both male and female cones were tinted with lovely pink and green shades.

Two kinds of Hemipterous insects, gaily coloured, were always busy on the cones, and appear to be the chief agents in pollination. I also observed green and yellow-bodied spiders, ants, and a bee. Bi- and trifurcated female cones were not uncommon. The seeds contained embryos at a fairly advanced stage of development.

Welwitschia must be seen growing in its native home to be adequately appreciated. With removal and transportation its leaves lose their colour and become split into ribbons. I was only able to bring home three quite small specimens.

It was delightful walking on the firm, finely-gravelled surface of the Namib plateau. Close to the *Welwitschia* groves rose dark, sombre rugged hills of dolomite and hornblende, while granite cropped out here and there; and we found beds of mica, asbestos, beryl and quartz, while in places were surface deposits of saltpetre.

Mirages were an almost constant feature of the distant view. Apart from *Welwitschia*, the most striking plant in that region was *Commiphora oblongifolia*, Schinz, bearing little tufts of leaves at the tips of short twigs which taper suddenly to a point from very stout swollen bases. Another very remarkable plant was a species of *Sarcocaulon* (near

S. mossamedense), the stems of which are covered with a waxy coating of extraordinary thickness. On rocky hillocks grew the weird Portulacaceous plant, *Anacampseros papyracea*, the striking *Crassula pyramidalis*, and the Asclepiad *Hoodia*, not to mention various *Euphorbias* and *Mesembryanthemums*. At one spot a veritable plant-hedgehog in the form of *Codon Royenii* Thurib (*Hydrophyllaceae*) was met with. Surely one has never seen anything more spinous! In the rocky ravines grew *Bauhinia Marlothii*, Engl., with its lovely yellow flowers. I also gathered *Sutera atropurpurea* (*Scrophulariaceae*), *Heliotropium strigosum*, Willd., *Salvadora persica*, Linn., *Aerva desertorum* (*Amaranthaceae*), and *Parkinsonia africana*, Sond., the Leguminous plant the seeds of which

provide excellent coffee for the natives. A small water Melon, *Citrullus* sp., trailed on the sand in the river beds. The presence of *Indigofera arenaria*, Rich., was interesting, as its only other known habitat is in East Africa.

Of trees, almost the only ones seen were *Acacia Giraffae* and *A. albida*.

Very little trace of animal life (apart from insects) was met with. The footprints of a gemsbok, a chameleon which we encountered on the trolley track, a hare darting from beneath a huge *Welwitschia* leaf, and an occasional mouse, were all I saw.

In view of the extreme aridity of the region, the variety of insect life was amazing. Nowhere in South Africa have I found the common house-fly so great a pest as in Damaraland; it is the bane of all out-door activities. One morning, running up the line on a trolley, I was struck violently on the eye by a large green locust. In the evenings, while sitting reading in the booking office which was at once parlour, bedroom and larder, the bright lamp-light induced a great invasion of the insect tribe. Small parties of very large ants came trooping in, and these I promptly killed. But the large moths, flies of various kinds, flying cockroaches, dragon-flies, grass-hoppers, and large heavy beetles resembling dumb-bells, which banged down on the table close to the lamp—all these I

* W. A. Cannon, *General and Physiological Features of the Vegetation of the more arid portions of South Africa, &c.*, Carneg. Inst., Washington, August, 1924.

paid little attention to. Not were mosquitos troublesome at night, very few of them being in evidence. It was certainly astonishing to see dragon-flies, as the only water for miles around was that contained in the station tank. Of butterflies I saw Whites and Painted Ladies.

A violent, hot, east wind, blowing clouds of dust, kept me indoors for two whole days.

I finally left by train for the coast, sitting in the blazing sun, close to the smoky engine, in an open truck amongst a party of Hottentots, using their luggage as the only available seating accommodation!

On all the dry rocks at Khan, the next station

WITH A NOTE-BOOK IN THE ESTEREL.

IN striking distinction to the often grey and barren limestone ranges which predominate along the Riviera, the Esterel group rises in rugged heights of igneous rock, consisting in the main of red porphyry. The hot, brick-red of this volcanic formation, often curiously interlaid with green porphyry, is never likely to be forgotten by anyone who has ever seen it in bold contrast with the sapphire of the sea or when making, as it often does, so pleasing a setting for the rich green of the Maritime Pine (*Pinus Pinaster*) or the softer moss-green of the Stone Pine (*P. Pinea*).

One bright morning in mid-April, I left Agay

inch long by half-an-inch broad), but by golden billow of *Cytisus triflorus*, and by masses of *Calycotome spinosa*, the latter, varying from pale yellow to forms in peculiarly rich tones of orange. Some of these latter I should like to have brought home, but *C. spinosa* has so far not been a success in my Welsh garden.

Erica arborea was much in evidence among the shrubs. I saw some good forms of *Viburnum Tinus*, which also I coveted and *Arbutus Unedo* was in flower and fruit. *Spartium junceum*, not so frequent here as in some limy regions, was not yet in bloom, but the local May tree, *Crataegus monogyna*, was padded with white. Also in the undergrowth of the Pine woods and along the wooded banks of the stream, which in places had been almost usurped by

FIG. 7.—A FEMALE PLANT OF WELWITSCHIA MIRABILIS BEARING CONES.

to Welwitsch, are great quantities of the exquisite little "Everlasting" or "Edelweiss," as it is locally named, *Helichrysum roseoniveum*, Marl. and Hoffm.; it is a gem of a plant and completely covered with a loose, cottonwool-like tomentum.

On the seashore at Swakopmund grew large bushes of *Zygophyllum Stapfii*, with its large, orbicular leaflets of fleshy texture. This reminds me that I collected another species with prostrate stems at Welwitsch, which still lies unnamed in the Kew Herbarium.

On the sand-dunes at the mouth of the river Swakop were many beautiful Tamarisk bushes, the species being either *Tamarix usneoides*, E. Mey, or *T. articulata*, Vahl.

A visit was paid to Walfisch Bay in order to see growing on the sand-mounds at the Hottentot village nearby, the interesting Cucurbitacea, *Acanthosicyos horrida*. At that time (April) the fruit was still unripe; material of this and the vegetative parts was collected. The American botanist, W. A. Cannon, appears to have found this plant much nearer Swakopmund. W. C. Worsdell.

for the gorge of Mal Infermet, which lies in the heart of this great oasis of red and green, and a more delightful walk I had not had in a three month's tour of Southern Europe. The first part of the route lay through pleasant meadows where the young hay, fragrant with homely Red Clover, was flushed with a subtle shade of bluish pink, the coalescing of the blue of *Linum angustifolium* with the fresh carmine-rose of Ragged Robin. Among the unfurling Bracken at the foot of the slopes I noted the pure white spikes of *Cephalanthera ensifolia*, and in drier places, where *Cistus monspeliensis*, *C. salvifolius* and *C. albidus* were all just approaching their fullest beauty, there were colonies of other members of the Orchidaceae, *Serapias cordigera* and *S. neglecta*.

At the foot of a northerly slope, cool with Ferns and Mosses, the shallow soil over wet rocks was sheeted with the lovely Saxifrage *granulata*, and along with this, ranging among the fragrant bushes of *Myrtus communis*, *Lavandula Stoechas* and *Lentiscus* (*Pistacia Lentiscus*) were quantities of the lovely *Anemone stellata* in an attractive shade of pink with a bluish reverse. In addition to the *Cistuses* which here cover mile after mile of the hillsides, their ranks were broken not only by the steel-grey foliage and purple bracts of the Lavender mentioned (these bracts were often over one

Acacia dealbata, I saw the snow-white *Amelanchier vulgaris*, and the rosy flush of a wild Apple, probably *Pyrus acerba*.

In part shade and along the roadside thickets, the curious brown "tongues" of *Aristolochia rotunda* were frequently seen. The lovely blue of *Anchusa italica* here seemed to take the place of *Borago officinalis*, so common elsewhere. *Allium triquetrum* followed the stream, whilst in drier places the beautiful, but more strongly flavoured, *A. roseum* was opening its first flowers. Scarlet Poppies and Corn Marigolds made a gay mosaic over the little clearings as the last of these was left behind, and along the borders of these cultivated places *Echinum creticum* was very conspicuous in bold patches of fiery red. Nor did that very attractive Thistle, *Galactites tomentosa*, with large, bright, rosy-lilac flowers, escape admiration. The spiny foliage of this handsome plant is often strikingly veined with ivory-white, while the underparts of the leaves are felted with the same colour. *Orchis provincialis* was also growing here.

As the road ascended the mountain side, the poor, stony soil often bared to the full beat of an unsparing sun, did not promise very much in the way of plant life. But *Helianthemum Tuberaria*, not yet flowering, proved to be abundant, and I soon came upon quantities of *H. guttatum*. This delightful little annual

varies considerably in stature, and its bright yellow petals do not always have the chocolate blotch at the base which gives them so close a resemblance to the blooms of *H. formosum* in miniature. On these dry slopes were quantities of *Asphodelus cerasiferus*, very stately and rising to nearly three feet, a more refined plant than the still taller, more branching *A. microcarpus*, which was common nearer the sea. The dainty St. Bruno's Lily (*Anthericum Liliago*) was also here, and shortly after seeing these, I came upon large areas of *Iris Chamaeiris*, which has large, rich purple flowers borne on stalks six inches long and very sweetly scented. Not less striking than any of these were the Milkworts (*Polygala nicaeensis*) of which there would appear to be several forms. These, growing to about a foot in height, made masses of colour in singularly deep shades of violet-purple, crimson and mauve. Especially brilliant was the effect when they were growing in conjunction with the golden masses of dwarf Broom (*Genista pilosa*), which abounded.

In the gorge, the foot of which is occupied by a bright and rocky trout stream and an excellent walking road which leads over to La Trayas, the scene was romantic and wild without being austere. The great cliffs and pinnacles of red rock which rose well above the tree tops were often stained with sulphur-yellow, plum-purple and blue-grey. Now and then a tiny Pine, looking centuries old, was seen clinging to a crack in their red-hot ribs, but beyond this they were utterly devoid of vegetation and recalled by their strange tints and pinnacled or columned form many a scene on a larger scale once seen on the Columbia river of North America.

Into the trough of the valley, around the feet of these towering mountains, the April sun streamed through leafing Alders and Hazels, and flushed with a brighter hue the purple blossoms of the alien Judas trees. These latter were often crowded so thickly along the waterside that the air beneath them was filled with a rosy radiance. Even so, numerous as they were, there was abundant evidence to show that before the gorge was burned out by one of these destructive fires which at this place or that, are ever reducing the forests of the Esterel to ashes, there were many more Judas trees than there are to-day.

Some of the deep and narrow clefts which fed the main ravine were filled with *Osmundas*, their old, brown fronds attaining to some four to five feet above the unfurling croziers of the new. A *Linaria* (probably *L. simplex*) was sharing a loose slide of rubble with *Antirrhinum latifolium*, whilst in similar spots were the spiny grey-green and yellow cushions of *Euphorbia spinosa*, which is always such a delight on the red cliffs of the sea. In the undergrowth hereabouts it was interesting to come upon the common Privet, and with it was the evergreen Buckthorn (*Rhamnus Alaternus*) clustered with greenish-yellow flowers. *Phillyrea angustifolia* was also noted in bloom, and the crimson berries of *Smilax aspera* were everywhere conspicuous.

Thymus vulgaris, in clumps about one foot high, was abundant, its delicate, rose-pink giving drifts of colour to the most barren of rocky slopes. On my return journey, I came upon a few plants in bloom of *Narcissus poeticus* which could hardly have been expected in a spot so remote from habitation. *N. tazetta* was growing in plenty in the lower meadows, and here, as they were going off, the splendid rich purple *Orchis laxiflora* was just beginning to flower. I also find a reference in my notes to *Genista hispanica*, very dwarfed and prostrate, growing along with *Calluna vulgaris*. *Orobanche cruenta* was discovered in various places, the dwarf Broom mentioned usually being the victim of its red and yellow clubs. Another parasitic plant noted when looking for *Cistus ladaniferus* (which could not be found) was *Cytinus Hypocistis*. This is generally found on *Cistus monspeliensis*, and appears in April, pushing out of the ground in a squat rosette, but it is very conspicuous with its scarlet bracts and vivid lemon-yellow, tubular flowers huddled together at its centre. This curious parasite is said to be the only non-tropical representative of the *Rafflesia* family, *Cytinaceae*. A. T. Johnson.

HANDICAPPING THE NURSERYMAN.

LARGE numbers of young trees are being planted, not only by private individuals, but in the great afforestation schemes that are being carried out by the Government in various parts of the country. In pre-war days the majority of such trees was raised in nurseries, but of late years the trade has largely passed into the hands of the Forestry Commission or Continental nursery firms, who are supplying the trees at so cheap a rate that our time-honoured industry is threatened with extinction.

Many home nurseries have been established by the Forestry Commission, at which nearly all the young trees that are required for the present Government scheme of replanting are raised from home-saved or foreign seeds, and well-grown, clean, healthy trees are being obtained. There is no doubt, however, that the production of such vast quantities of forest trees is having a bad effect on the business of legitimate nursery firms. This is all the more serious when it is remembered that during the war many nurseries had to close down owing to there being no demand for their stocks, and these drawbacks, combined with German and other outside competition, have almost ruined one of the oldest and most useful of our national industries. Little wonder, therefore, that nurserymen in several parts of the country are up in arms against the policy of the Forestry Department, and certain private owners of estates, in rearing their own stocks of trees for afforestation purposes.

There are complaints from many districts; one nurseryman in a fair way of business in Southern England declares that his trade has suffered severely, not only from competition by private nurseries, but owing to the importation of large numbers of seedling trees from Continental sources. It is, perhaps, invidious to mention names, but a well-known nurseryman who had raised large stocks of seedling trees in anticipation that an extensive scheme of afforestation, near by, would relieve him of considerable numbers of these, found out his mistake, when a staff of workmen arrived to trench and plant a tract of land for the rearing of young trees on the site of the proposed plantation. An almost parallel case was reported from Wales. But these are only isolated examples that by chance were brought to notice, for that others of an almost similar kind have occurred in other parts of the country may be inferred from letters that have appeared in the public press.

One nurseryman of many years' standing, states that he considers competition should not take place between public and private individuals or State Forestry Departments, in the matter of raising forest trees, as not only has the legitimate cultivator of these to pay high rent, rates, and taxes, on his land, but he constantly employs a staff of competent workmen who raise the trees that are required for the formation of woods and plantations. It is further contended that seeds of forest trees can be procured by the Department at a much cheaper rate—sometimes free of all cost—than is the case with the nurseryman.

In the North of Scotland high prices are at present being paid by nurserymen for the collecting of cones of the native Pine, Larch, and other trees, from which young stock is to be raised. Nurserymen contend, and rightly, too, that the raising of many millions of young trees by a Government Department for afforestation purposes is a decided set-back to the production of these by nursery firms, and that by so doing a long established industry of this country will, in the long run, be partially eliminated. When in Scotland lately, I had an opportunity of visiting some of these extensive tree nurseries that have been established by the Forestry Commission, where millions of trees, chiefly Coniferous, are cultivated, including principally the common and Japanese Larch, Scotch and Corsican Pine, common and Silver Spruce, and Douglas Fir. With cheaper labour at their command, and seeds, either free or at a low rate, the Commission can raise young trees at a comparatively lower rate than the majority of our public nurseries.

It has been argued that young trees raised on land of a similar kind and at equal altitude to that on which they are to be planted permanently, have better chances of succeeding than others that are transferred from a distance, and require to be conveyed thither by road or rail, often for many miles, which necessitates their being packed in bundles, when the roots must suffer in consequence. That there is a great amount of truth in this statement no one of experience in tree planting will deny, though that there are many public nurseries situated at considerable elevations, where young stock is raised that is of sufficiently hardy nature to withstand the climate of the highest altitudes at which tree planting takes place in this country, must also be admitted. Such are to be found in Northern England, many parts of Scotland, mountainous districts of Wales, and in parts of Ireland, where young trees are raised under conditions that fit them for withstanding the cold and wind-swept hillsides where they are intended for afforesting purposes.

Nor has it been disproved that stocks of trees raised at a moderate elevation where the plants grow strong and robust, are not quite equal to others that have been reared on higher and more exposed land, and in consequence are sometimes starved and wanting in the stamina of the more favourably cultivated trees.

The question of expense has also been advanced in favour of trees raised in public nurseries, the head of a well-known firm stating that, in comparison with others raised in private grounds, those supplied by bona-fide growers can be produced at nearly one-third cheaper rate. He also contends that in the case of private nurseries the cost of producing young trees includes rent of land and taxes, while unemployed labour is often made use of for certain classes of work. When the conditions of land tenure and working expenses are taken into account, this is only what might be expected.

Another fact is that forest trees can be raised more cheaply and efficiently by experienced workmen than by casuals, however well they may be looked after. I have had to do with several large, well-wooded estates, on each of which a home nursery was worked, but in every case the bulk of the plants raised were more of the kind for under planting and shrubbery work than for general forest planting. The fact, however, remains that vast quantities of Coniferous tree seeds that are yearly being sent to this country from Canada and elsewhere, and from which millions of young stock is raised, must act prejudicially in the interests of the legitimate nurseryman.

As giving some idea of the immense quantities in which seeds are being sent, the Crown Timber Agent at New Westminster, informs us that in reply to an urgent cable message from Great Britain, 1,500 lbs. of Sitka Spruce seeds were forwarded a year ago, to the British Forestry Commission for planting in North Britain. In addition to these seeds, ten sacks of Lodgepole Pine seeds were sent from Northern British Columbia, while a shipment of twenty-five sacks of Douglas Fir cones was collected in the William Lake district, and 250 sacks on Queen Charlotte's Island by Provincial foresters. A. D. Webster.

RARE GARDEN WORMS.

II.—THE VENETIAN WORM.

WHILE working on the annelids of Ireland, I had the good fortune to discover, in June, 1892, a new garden worm. This was described as *Allolobophora hibernica*. It is rosy- or flesh-coloured in front, with a dull yellow girdle, greyish posterior, and tail resembling that of the Gilt-tail. On sending the description to Dr. Rosa, of Turin, I learned from him that he had already described a similar worm from Venice, but that the Hibernian form differed from his type in many particulars, and if not specifically different, was at least so well marked a variety as to merit the name I had given it. Rosa's worm, therefore, as being the first to be described, retains priority, and to his *Eisenia veneta* (Figs. 8, 9) mine stands as var. *hibernica*. But it was found, as the years went

by, and our knowledge of garden worms extended, that the Venetian worm was the most unstable and variable creature to be found in our annelid fauna. Recent discoveries have extended our knowledge, and it is the object of this paper to give some account of the polymorphic animal, and the many varieties to be found in our English gardens.

The typical Venice worm is closely related to our common Brandling (*Eisenia foetida*, Sav.), and some of its forms are so closely similar that they might be, and are at times, confused the one with the other. Even in the types from which Rosa deduced his definition, there was much variation in the shape of the head, the extent of the girdle, the length, number of segments and other details. In general, the worm is flesh-coloured with darker bands. The setae are wide apart, *i.e.*, in eight rows instead of four pairs, as is more usual in earthworms; the male pores on the fifteenth segment are sometimes on conspicuous papillae, while at other times they are hardly to be seen. The girdle may begin anywhere between the twenty-fourth and twenty-seventh segment, and ends on the thirty-second or thirty-third. On two of these, *viz.*, thirty and thirty-one, are swellings, known to the student as tubercula pubertatis; the length is from two to three-

Of so great interest is this worm and its many varieties that Southern* some years ago prepared a chart showing the distribution of the type, together with the three forms *hortensis*, *hibernica*, and *zebra*. It is known to occur from the west coast of Ireland through Wales and England to Germany, Switzerland, Italy, Dalmatia, the Crimea and Transcaucasia, then back by Crete to Portugal and Madeira, whence I received it some years ago through Dr. Turnbull, of Ireland. It has also been found in California, Santiago, the Argentine and Port Elizabeth, to mention some of the best-known localities. It is endowed with the grace of adaptation, and thus is able to succeed where other species fail. The number of worms which exhibit this characteristic is very limited, but we have some half-dozen or more which have become cosmopolites.

In 1904, I added another distinct variety to our list. In stiff soil, at the roots of plants in the Lily house of the Oxford Botanical Gardens I found in March of that year a long and slender form closely resembling a young brandling with the girdle limited to four segments, twenty-nine to thirty-two, and the tubercula, as usual, on the thirtieth and thirty-first. This was named, from its occurrence indoors, *var. tepidaria*. Five years

Thus far, then, our Venetian worm has been found to exhibit at least six different forms or variations, and to these may be added a Continental form (*hortensis*) which may or may not be included among those already named. But now, I think it necessary to add yet another, and a new name, *tumida*, to our list. At Bettws-y-coed I found five specimens of the

FIG. 10.—GIRDLE OF *EISENIA VENETA* VAR. *TYPICA*. 26-33, GIRDLE; TUBERCULA ON 29-30. (ENLARGED).

Venice worm under the bark of an old fallen tree in the company of several *Dendrobaenas*, and these, I think, belong to one of the varieties already named. But in a rock garden at Ty'n-y-Maes, Colwyn Bay, I found half-a-dozen specimens, which, while they closely resemble *var. robusta*, are clearly differentiated from it by one peculiarity. It is well-known that the rule among native earthworms is that the girdle should be most fully developed dorsally. Sometimes it forms a simple saddle, at other times it extends to a greater or lesser distance down the sides, but it is a very rare thing for the girdle to be conspicuous ventrally. In the new variety, *tumida*, however, the girdle cannot be seen on the dorsal surface. The appearance is as if this saddle had slipped from its place, and was held in position, topsy-turvy, on the underside of the worm. This is a decided novelty. On the upper surface, in specimens preserved in alcohol, there is a depression where the girdle ought to be, and a corresponding tumidity or swelling underneath. This variety may be thus described:—

A small worm, an inch in length, flesh-coloured in front and grey behind, with the girdle undeveloped dorsally and tumid ventrally. Male pores on segment fifteen inconspicuous, setae widely apart; the worms stretching out straight when preserved, and not forming a curve or crescent. Segments covered by the girdle

FIG. 11.—VENTRAL ASPECT OF *EISENIA VENETA* VAR. *TUMIDA*: 15, MALE PORES; 26-32, GIRDLE. $\times 2$.

twenty-six to thirty-two with some variation, the tubercula on the usual segments thirty and thirty-one.

It thus appears that we have at least seven different forms of this worm in Great Britain, the principal haunts being rich garden soil and garden rubbish heaps. The list, with localities, may be of interest for future reference, as I hope we may yet add other forms when gardeners and naturalists awake to the interest and importance of the study and send me collections of rare forms from old gardens up and down the country for identification and comparison.

VARIETIES OF THE VENETIAN WORM.

Eisenia veneta, Rosa (Figs. 8, 9).

1. Var. *typica* (Fig. 10). Reported from Armenia, Palestine, Sevastopol, Trieste, Vienna,

FIG. 8.—LATERO-VENTRAL ASPECT OF *EISENIA VENETA*, ROSA: 15, MALE PORES; 26-33, GIRDLE. $\times 2$.

and-a-half inches (fifty to eighty millimetres), the diameter is five millimetres and upwards, which is unusual for so short a worm, and there are from 120 to 155 segments.

In September, 1909, I found specimens of this worm at Kew, and concluded that it had been introduced from abroad. This idea is confirmed by the fact that until recently no single specimen of the type seems to have been found in any garden in this country. In September, 1926, however, I had the good fortune to find among garden refuse at Colwyn Bay, a solitary worm which answers almost exactly to this description. Such departures from the type as may be found are quite in harmony with its known variability, and only tend to keep up its character for instability. At the same time, I found two varieties of the species in North Wales, and this makes the subject one of the greatest interest. Another variety, found by Dr. Michaelsen some years

later, I found two very distinct varieties in gardens at Malvern. One of these, named *robusta*, on account of its sturdy appearance, is widely distributed, and seems to be the British type. I have found it at Kew and Oxford, as well as Malvern, and now have to record a similar form from North Wales. Differing considerably from this is the variety which I have named *dendroidea*, on account of its resemblances to some of the tree-worms (*Dendrobaenas*). The male pores on segment fifteen are not very conspicuous, usually—though here again variation occurs—the girdle extends from segment twenty-nine to thirty-five, and the tubercula are sometimes on thirty, thirty-one and thirty-two, thus recalling another species of the same genus (*Eisenia alpina*), which has once been found in Scotland, but is as yet unknown in our English gardens. It should, however, flourish in such conditions as are provided by the rock gardens at Llandudno.

This last variety (if it be not a distinct species) is very active, forming a ring when touched, and then, by a great muscular effort, flinging itself away. I have observed a similar habit in another worm and have endeavoured to depict the action in my little book on *British Earthworms*. Another peculiarity must be noticed. In the case of *robusta* and one or two other varieties, which are pale and wanting in permanent pigment bands, the worms, when placed in alcohol, stretch out straight. But in that of *dendroidea* and *typica* the worm bends into a crescent. Here we have a subject of very great interest for the physiologist and the student of life-habits. There is a decided difference in the musculature of the different forms, and this must be related, among other things, to the conditions of life in which they are placed.

*Contributions towards a Monograph of Oligochaeta, *Proc. Roy. Ir. Acad.* 1909, p. 123.

FIG. 9.—HEAD OF *EISENIA VENETA*. (ENLARGED).

ago, was named *zebra*, and this has been found by Southern in Ireland, though not in England. The tubercula extend over segments twenty-nine to thirty-two, the length is 120 mm., the segments number 150, and the diameter is 8 mm. This is the largest form known.

Venice; and in England from Kew Gardens, September 1909 and Colwyn Bay, September, 1926.

2. Var. zebra, Mich. Ireland.
3. Var. hibernica, Friend. Dublin, 1892. Perhaps the same as var. decolor, Rosa, or *Allobophora cantabrica*, Rosa.
4. Var. tepidaria, Friend. Oxford, March, 1904.
5. Var. dendroidea, Friend. Malvern, 1909.
6. Var. robusta, Friend. Malvern, Kew and Oxford. First described in 1909.
7. Var. tumida, Friend (Fig. 11). Found at Colwyn Bay, September 1, 1926.

Hilderic Friend, Cathay, Solihull.

SEASONAL PESTS AND THEIR CONTROL.

MEALY BUG.

PERHAPS no pest known to the plant grower is more generally feared than this persistent and dangerous insect. Losses caused by mealy bugs are enormous, not only from their effect on the plants infested, but also from the fact that other plants placed in infested houses are quickly attacked. Many species of plants are subject to the attack of this pest; most of the soft greenhouse plants as well as certain of the ornamental shrubs are susceptible.

Mealy bugs belong to the scale insect family but differ from the others by the fact that they can move around throughout their life. They are called mealy bugs because of their mealy or waxy covering. Their habits and the types of damage they do, are very similar to those of the other scale insects. Due to their ability to move around and the fact that they can hide in cracks and in the soil, however, causes them to be much more feared than are the scales. In determining control, consideration must be given to these facts as well as the fact that the waxy covering makes it extremely difficult to wet the insect with a spray.

THRIPS.

Many species of this pest attack ornamental and flowering plants. In some sections the seriousness of infestations by thrips cannot be over estimated. This is particularly true with Rose, Carnation and Chrysanthemum culture.

Thrips scrape the leaves and suck the juices from the tissue and also work in the flowers and buds. They cause faded leaves and deformed and puny flowers. The excretion of a reddish-brown substance causes a brown spotting on the plants where they are feeding.

Complete freedom from thrips is almost an impossibility with many growers.

Considerable interest has been shown during the past two or three years in the use of high-boiling emulsified petroleum oils of the lubricating types. Considerable work has been done in the United States and in Australia where this class of oil has been applied for the control of mealy bug, scale and red spider.

It has been shown that these oils can be used almost with impunity on the most delicate types of foliage without the risk of scorching. Some of these emulsions are prepared to contain eighty per cent. oil emulsified mechanically in the presence of a protective colloid. No soap is used, which means that they can be used with all classes of water without the incorporation of an outside spreader.

Research has shown that the oils have to be highly purified. Ordinary petroleum or engine oil cannot be used owing to the presence of sulphur compounds and great care has to be exercised in the manufacture and rectification of the oils to exclude all traces of sulphur and sulphur compounds.

These emulsions readily mix with water and are generally applied at the rate of a one or two per cent. solution. They may be used with nicotine, which greatly enhances their value.

One brand of oil with which the writer has had a fair amount of experience this season is known as "Volck," named after the inventor of the process of manufacture.

When sprayed on the foliage, the emulsion breaks down, leaving a microscopically thin

film of oil. This has been shown to be very successful for the control of spider, scale, mealy bug and a number of other insects.

CLADOSPORIUM.

This season has been characterised by the early appearance of mildew (*Cladosporium fulvum*), which, if not promptly checked, will undoubtedly considerably reduce what would otherwise be a heavy crop of Tomatos.

In the various growing districts, Tomatos look exceptionally well this year, possessing fine stamina, vigour and vitality. In the Lea Valley there has been a fair amount of stripe disease, notwithstanding the use of the standard dressings of sulphate of potash.

Some growers attribute the early appearance of mildew to shutting down the fires too early in the season; others consider it is purely a question of ventilation. No doubt the real explanation is a combination of these two factors.

I tried one or two interesting experiments in the latter part of last season. These consisted of vaporising naphthaline at the rate of fifteen to twenty ounces per 1,000 cubic feet, in the naphthaline fumigating lamps, and maintaining a high temperature with plenty of humidity and fumigating prior to pulling out the haulm; the object being to destroy red spider and its eggs before they had a chance of migrating to the ridge boards and other places of hibernation.

This was followed by fumigating with formaldehyde solution, 40 per cent. vaporised in the naphthaline lamps at the rate of ten ounces per 1,000 cubic feet; the object in this case was to destroy any fungous spores remaining in the house.

Up to the time of writing, the crops in this house this year are free from red spider and mildew, whilst other adjoining houses on the nursery are affected to a greater or lesser extent.

The results of these experiments are interesting, and they offer a means of starting the season with a fairly clean house.

On some of the nurseries where mildew has not appeared, the growers have been induced to take preventive measures in the early stages, either by spraying or dusting with some suitable material. Others are utilising various methods for vaporising sulphur, and so far this preventive treatment appears to have been very successful. Once the mildew is well established it is almost impossible to eradicate and sometimes very difficult to even check the rapid growth and spread of the disease.

The grower should endeavour to have a coating of some suitable fungicide on both the upper and under sides of the foliage before the spores have had a chance of germinating.

The materials most commonly used are:—

(1) Ammonium copper carbonate solution containing a saponaceous spreader used at the rate of one gallon to 80 to 100 gallons water. This should be applied as early as possible, otherwise ripening fruit may have to be wiped in order to remove the slight deposit.

(2) Ammonium polysulphide solution, at the rate of one gallon to 200 gallons of water, to which has been added 10 to 15 lbs. of good quality soft soap. The advantage of ammonium polysulphide solution is that it leaves an almost imperceptible film of sulphur, which is not likely to affect the marketable value of the crop and so eliminates the necessity for wiping.

(3) Colloidal sulphur has been used, particularly in the Worthing district, with a considerable amount of success. Again, in the application of this material, it is desirable to use it in the early stages in order to eliminate the necessity for wiping the fruit, as colloidal sulphur leaves a perceptible deposit. It is used at the rate of 2 lbs. to 100 gallons of water, in which about 4 lbs. of soft soap has previously been dissolved to give the mixture the necessary wetting power.

Various dusts have been used for the control of the disease on commercial nurseries, but the application of dust specifics and the success resulting from their use depend very largely on the materials used, and the degree of fineness, in conjunction with a suitable means of application.

When dusting it is very desirable to produce a cloud in the house, and the dispersal of the cloud will depend entirely upon the size of the particles.

(4) Dry Dusting Sulphur. This consists of sulphur which has been ground to pass a 200 meshes to the inch sieve. It appears to be only effective in the presence of bright sunshine, and a certain amount of humidity is desirable.

(5) Green Sulphur. This is a dry, dusting form of sulphur, and usually contains anything from 33 per cent. to 43 per cent. actual sulphur (free), with a small proportion combined with iron in the form of sulphide.

Green sulphur has had an extended use as a dust, particularly under glass, but its chief value is the fact that it is usually in a very fine state of division and therefore easily "dusted."

Its efficiency as a fungicidal dust, however, cannot be compared with that of a good quality dusting sulphur. Sieving analysis show a good sample to give:—46 per cent. passing a 200 meshes to the inch sieve; 23 per cent. retained by a 200 meshes to the inch sieve; 15.5 per cent. retained by a 150 meshes to the inch sieve; 10.5 per cent. retained by a 120 meshes to the inch sieve; 5 per cent. retained by a 90 meshes to the inch sieve.

Comparing the price of green sulphur with that of any good dusting sulphur, there is little doubt that it is an expensive proposition, particularly when its sulphur content is taken into consideration.

(6) Vaporising sulphur by means of the Rota Generator or Campbell's Fumigator has also given very good results.

An interesting fact worthy of record is that the "Volck" oils mentioned above, when applied to the foliage, produces a microscopically thin film over the foliage, on which the spores of mildew are unable to germinate. Whilst they cannot be considered to be fungicidal, they can be claimed to have a fungicidal action, Theodore Parker.

APIARY NOTES.

QUEEN REARING.

At this time of the year bees in most hives show signs of swarming. Old-fashioned apiarists allow nature to work in her own way and just hive each swarm as it appears, without enquiring too closely what kind of queen is at the head of the swarm. But closer examination of the matter shows how vital the queen is and, unless some attempt is made to control the production of queens, the hives will contain a motley crew, and results will be as varied. It is not an accident that one hive gives a surplus of honey and another a deficiency; it generally means that one has a good queen and the other has not. This variation is noticeable even where the greatest care is taken in rearing only the best possible queens. Not every bee-keeper realises the need for obtaining the best possible queens to head his stocks, and many bee-keepers grudge the price of a queen when it is suggested they should send to a reputable queen-breeder for one of his selected strain. But even though the small sum necessary for a good queen be grudged—and if only it could be realised how quickly that sum is returned with interest it would not be grudged—no one can fail to see that by constantly re-queening from his best stock, and not allowing the matter to remain entirely at the discretion of the bees themselves, he is bound, in time, to improve the honey-gathering qualities of his bees.

Therefore, at this time of year, every bee-keeper should keep a record of what his hives have done, and when the very best hive swarms he should go through it immediately and carefully cut out all the cells he can find, leaving but one. He will, in that way, save another swarm issuing, and he will have ensured enough cells to re-queen any hives that have poor queens. Cut out enough of the comb to avoid injuring the nymph in the cell, and then, going to the hive that is unsatisfactory, kill the queen, and cut a hole in one of the combs just the right

sure to take the cell brought from the other hive. Keep the cell the proper way up, i.e., with the end hanging downward. It will be necessary to protect the cell from the bees, and this is done by a West cell-protector, obtainable for a few pence from any appliance dealer. In a few days the egg will hatch and produce a virgin queen, which in turn will mate and give a stock headed by a queen of the owner's best strain.

There will probably be many cells to spare. Now is the time to make economic increase of the stock. Take a couple of combs, one of honey, and one with a little sealed brood, from any hive that can spare it, place them in an empty hive with all the bees adhering, close up the entrance for thirty-six hours, inserting one of the cells before doing so, and again a virgin queen will hatch, in due course, mate, and provide a nucleus having a laying queen. This can be strengthened after the honey flow by a little more brood, and so by the end of the season another good stock at little or no cost to the honey harvest will be secured.

By these means increase may be obtained and only one hive allowed to swarm. Even that is unnecessary if a little trouble is taken. Examine the hive containing the good queen a little before the time she will swarm, catch the queen just before the queen cells are capped over, make a nucleus of her, and leaving only one cell, cut out the rest as described above. A few days later go through the hive again, and if more cells have been raised, which is quite likely, cut them out too. In this way, bees may be prevented from swarming, increase to any extent desired may be made, and all the stocks may be re-queened annually from the best queen of the year before. *J. Marie.*

DEEP CULTIVATION.

DURING the past few months there has been much discussion in the pages of *The Gardeners' Chronicle* as to the advisability of bringing sub-soil to the surface and to bury the top soil. Some have approved of the practice, others have condemned. It appears to me that both are not altogether correct in their views, mainly because they are viewing the problem from a different standpoint.

Mr. Beckett* points out the value of deep trenching, and while in the main I agree with the views expressed, there are some sentences which seem to call for further discussion, e.g., "I am quite confident that the results obtained are profitable, even having regard to the extra labour employed." Viewed solely from the standpoint of exhibition vegetables, this may be correct, but I do not feel confident that to trench soil four feet deep for general vegetable crops is a sound economic proposition. If it be a sound economic proposition, it is rather strange that market gardeners growing vegetables for market do not more readily adopt the plan. Again: "Afford the plants proper root-run and good results will follow; no matter what kind of sub-soil is brought up to the top, if the impoverished top spit is buried there will the finest results accrue." The truth of this statement will depend upon at least two factors, the kind of sub-soil, and the treatment of the subsoil after it is brought up.

It is a common practice of people laying drains to fill in the holes by placing the top spit in the bottom and leaving the sub-soil on the surface. If a number of such filled-in drains be examined for a season or two afterwards, it will be found that vegetation is never very good at first, but that on some of the drains, after the first season, plants begin to establish themselves, and after a few seasons the vegetation is good. On others the vegetation is very poor for a number of years. This would seem to point to the fact that subsoils vary considerably; some can very soon contribute enough food to support plant life, but others cannot do so. A more probable reason is that the first types do not contain plant poisons in the shape

of unoxidised materials, but the second types do.

As regards the treatment of the sub-soil after it is brought up, if leaf-soil, manure and wood-ash are mixed with it good results will follow. If these materials are in short supply, then the practice of bringing up quantities of sub-soil to the surface will be followed by a long or short period of partial sterility, according to the type of sub-soil brought up.

Some that have condemned the practice of bringing up sub-soil have been inclined to be definite that the practice is always wrong, whereas under certain conditions, very great soil improvement can be made by bringing up the bottom layer. On certain soils where the sub-soil is of the opposite type to the top soil the practice of bringing up sub-soil pays. Mansfield* gives a very interesting account of the claying of certain fen soils. He writes under "Objects": "Claying is usually done in the winter months, when other work on the farm is slack, and the field selected has generally carried corn the previous year. The objects aimed at are:—

- (1) "To apply a maximum amount of clay to the surface soil with a minimum of labour."
- (2) "To avoid burying any of the 'made' top soil but to conserve it on the surface;"
- (3) "To replace the clay removed, refilling the trenches with inert peat, material which it is useless to incorporate with the top soil, which already contains excess of organic matter, but which, being of a porous nature, will assist drainage."

This article should be closely studied by those who are interested in the subject of the cultivation of the soil. It should be noted that in this case the material brought up is not, strictly speaking, the sub-soil, but a layer of material lying underneath the peat sub-soil.

The practice of claying certain lands has been carried out for many years; if the clay lies directly below the soil to be treated, so much the better, but more frequently the clay has to be imported from a distance. Hall† points out that for this purpose marl containing carbonate of lime is always of more value than clay, because the clay is so little friable and so sterile itself that the improvement is a slow one. The same writer also draws attention to the fact that old cultivated gardens are often in need of claying or marling, especially when such gardens are situated upon gravel soils.

If the above review be correct, it would appear that under some conditions (if it is an economic proposition), the bringing up of sub-soil in quantity is good practice provided the sub-soil can be made into good material by the addition of various ingredients. The soil of a garden so treated can be deepened considerably, and the "worn-out" top soil placed in a good position to regain some of its lost properties. It is well if a definition is given to the term "worn-out" soil, because various people use this term in several ways. I am using the term to mean a soil which, by constant cultivation and manuring, has had all the finer clay particles washed down to lower levels. Such a soil is extremely open, has lost all power of cohesion, and suffers from lack of water in a dry period. Further, it is often acid owing to its high organic content. If one is in the position to be able to carry out occasional trenching, and with the judicious use of lime or chalk, "worn-out" soil should not occur. Under most conditions the bringing up of the sub-soil and leaving it untreated on the surface is bad practice, but that there are special occasions when the sub-soil well-mixed with the top layer of soil is very good practice.

I am inclined to think that Baines,‡ writing more than fifty years ago, gives us some useful advice with regard to trenching: "All ground that is used for vegetable crops should be trenched every three or four years, a couple of inches of fresh earth being brought to the surface on each occasion. This more especially applies to old gardens, where, if it is not done, the surface becomes exhausted." It is necessary to dis-

criminate between old and new gardens, as, in the latter, at a comparatively small depth, the soil is yet crude. To bring any considerable quantity of this to the top and more or less to bury the surface soil that has, by stirring and exposure to the sun and air, together with the application of manures, become better adapted to the requirements of plant life, would be a serious mistake, which would be most injurious in its consequence to the crops for a year or two afterwards. *Somerset.*

VEGETABLE GARDEN.

CELERY.

CELERY for early use should now be growing freely, and if the weather is dry, the plants will be greatly benefited by giving the roots copious supplies of water, and diluted liquid manure occasionally. Trenches are not necessary for this early crop, as the plants may be grown successfully on the flat or in frames in which early salads, etc., have been grown, and the blanching of the stems may be done by means of bands of stiff brown paper. The paper should be cut about six inches wide, and long enough to wrap around the stems twice.

When the plants are about half-grown, remove all side-shoots, and place the first band around the base of each plant, making it secure with broad bast.

Dust the soil lightly with soot to ward off slugs, and then mulch the plants with old Mushroom-bed manure.

Watch the plants carefully to see that the hearts are growing upright, and see also that the ties are not too tight. Before placing the second band of paper in position, remove the first to make sure the stems are clean, then replace it, and tie the second band just above the first.

The stems are lengthening fast now and will soon require another band of paper above the second, but take care to examine the plants before doing this. Tall-growing varieties will possibly require another band above the third, and this will ensure the stems being well blanched up to the foliage. Dust the latter slightly with old soot during showery weather, as this will help to ward off the Celery fly, and will also cause the foliage to be a dark green colour. A great advantage of this method of blanching is that the plants may be well watered right to the time they have finished growing, and the stems will also be much cleaner. A broad piece of bast should be tied around the foliage when the plants reach maturity to prevent the wind breaking it down.

The planting of maincrop and late Celery should now be completed in well-manured trenches. Keep the plants well supplied with water, and damp them overhead every afternoon with a rosed can. Celery can hardly be overwatered during the summer, as it is a moisture-loving plant; occasionally the soil should be drenched with diluted manure water, and the trenches mulched with half-decayed manure. It requires about six or eight weeks to blanch Celery grown in this way; therefore the earthing up process should be started about six weeks before the crop is required for use. The plants should first be divested of all side-shoots and bad foliage, then tied with matting about half-way up the stem to prevent the soil from reaching the hearts. Dust the plants liberally with soot, and give the trench a final soaking with water. Place a garden line down each side of the trench, about six inches from the edge, cut along this with the spade as deeply as possible, take out a trench the width of the spade along the ridge, and then carefully place this soil around the plants, taking care not to drop any into the hearts. Break the earth finely, and do not put a large quantity around the plants at the first operation. Make it fairly firm and, when the row is completed, cut the ties, and the plants will not need further attention until the next earthing-up is done in about ten days or so. The plants should again be tied up, unless an assistant can be spared to draw them together by the hand, and the process repeated.

*Mansfield, W. S. The Claying of Fen Soil. *Journal of the Ministry of Agri.*, Vol. XXVIII., p. 412.

† Hall, D., The Soil.

‡ Baines, T. Trenching. *The Garden*, Oct. 16, 1875, p. 330.

* Beckett, E. The Value of Deep Trenching. *Gard. Chron.*, Dec. 18, 1926, p. 495.

The stems will lengthen somewhat during the earthing up process; therefore, another and final earthing up will be needed, and this, if possible, should be completed before there is danger of severe frost. Especially is this desirable in the case of late Celery, or it will not keep well. Dust the plants freely with soot every time earth is drawn up to them, for this material not only helps to ward off the Celery fly, but also acts as a stimulant to growth. Make a point of earthing up the plants only when they are quite dry; it is a good plan to water the plants one day and earth them up the next, if the day is fine. The bank when completed should be made firm with the back of the spade, as a steep ridge helps to throw off superfluous moisture during the winter.—R. W. Thatcher, Carlton Park Gardens, Market Harborough.

HOME CORRESPONDENCE.

Deterioration of Strawberries.—The leading article on Strawberry, to which your correspondent draws attention on p. 440, vol. LXXXI, follows much on the same lines as the lecture given at Hereford, on May 18, by Mr. L. N. Staniland. While the remarks he made may, to some extent, apply to those who adopt horse cultivation, it cannot be said that many of our leading private growers are likely to neglect their Strawberry plantations. Already two correspondents have shown the care they have given their plants, and it is to be hoped that some of the commercial fruit-growers of Kent and Hants will contribute to this correspondence. I have grown large quantities of Strawberries, both in Kent and Berkshire, and the plants, even with horse cultivation, grew like Cabbages. Strawberries in commercial areas were often severely defoliated with a bagging hook and the ground worked constantly with horse hoes, yet they became large and healthy. What is needed, apparently, is a certificate of health, as we have against Potato disease. It has been the custom of growers to obtain a fresh stock of Strawberry plants from time to time, as of Potatoes, to avoid deterioration; yet here, as in several gardens in this and adjacent counties, the home stock is growing with much more vigour than those obtained from a different district, although such importations have not necessarily been from the same source. From observation, there appears to be two essential factors for successful Strawberry growing. The stock must be grown entirely for propagating purposes, and the plant's vitality must not be impaired by over-production, secondary runners not being allowed to develop. Correspondents have appealed for an explanation of the causes and remedies for the pests which attack the Strawberry, but, so far, we have only had cultural hints by entomologists. We should welcome information, whether spraying with an insecticide or fungicide is recommended, and the time the application would be most efficacious. It may be that the last three successive winters have been detrimental to the growth of Strawberries. Another reason advanced is that owing to the dearth of animal manure, there has been an indiscriminate use of artificial fertilisers unsuited to certain soils. Sulphate of potash is probably the one most suitable fertiliser. I submit the following suggestions with regard to this crop. The ground for new plantations should be well trenched and enriched with a liberal dressing of farmyard manure. The plants should be sprayed with or dipped in an insecticide before planting them, and be moulded up during the winter, a further spraying, to be made in April, with a combined insecticide and fungicide, such as lime-sulphur-paraffin emulsion. Sulphide of potassium, though excellent for killing red spider as well as disease is, I find, of no use in damp weather, being easily washed off the plants. Finally, the Board of Agriculture should make the "Schedule of Plant Diseases" more widely known by posters in rural districts, and encourage County Councils to give lectures on these matters, particularly in the districts most concerned. A. J. Hartless, Kings Walden Bury Gardens, Hitchin, Herts.

SOCIETIES.

ROYAL HORTICULTURAL.

AMATEUR SHOW.

TUESDAY, JUNE 28.—The special Amateur Show of the Royal Horticultural Society, which was held on Tuesday last in the Vincent Square Hall, Westminster, was the best of the three of the series that have been held, and, in view of the unfavourable season, this points to greater success in the future. Practically all kinds of garden flowers were included in the schedule, and in most classes the exhibits were of fine quality, especially flowering shrubs, Sweet Peas and Roses.

The schedule was divided into three divisions, A, B and C, and in each of these a special cup was offered to the most successful exhibitor. They were awarded as follow: Division A, to Sir WM. LAWRENCE, Bt., who obtained thirty points; Division B, to G. H. FISHER, Esq., with thirty-six points, and Division C, to C. LUCKIN, Esq., with thirty-six points. The Garden Club Cup offered for the best exhibit in the show was awarded to F. W. FRANK, Esq., for Sweet Peas, who also won the Silver-gilt Medal of the National Sweet Pea Society for this superb exhibit.

FLORAL COMMITTEE.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mrs. E. M. Wightman, Mr. J. M. Bridgeford, Mr. H. J. Jones, Mr. W. H. Page, Mr. A. E. Vasey, Mr. James B. Riding, Mr. William Howe, Lady Beatrix Stanley, Mrs. Helen Lindsay-Smith, Mr. D. B. Crane, Mr. W. B. Gingell, Mr. Arthur Turner, Mr. M. C. Allwood and Mr. W. D. Cartwright, Secretary.

Section B.—Mr. T. Hay (in the chair), Sir William Lawrence, Bt., Mr. G. Reuthe, Mr. F. G. Preston, Mr. George Harrow, Mr. James Hudson, Mr. W. B. Cranfield, Mr. G. Yeld, Mr. E. H. Wilding, Mr. Amos Perry, Mr. A. Bedford, Mr. R. D. Trotter, Mr. Mark Fenwick and Mr. N. K. Gould, Secretary.

AWARDS OF MERIT.

Eucomis bicolor.—An exceptionally well-grown specimen of this South African bulbous plant was shown. The stout, erect racemes were well furnished with greenish-white flowers which have purple filaments. Shown by Mrs. CARL HOLMES, The Node, Welwyn, Herts.

Philadelphus Atlas.—A free-flowering Mock Orange of graceful habit, bearing large, flattish, white flowers which, unfortunately, do not appear to be fragrant. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

Veronica Matthewsii.—An attractive, shrubby Veronica of graceful habit and medium size. The small leaves are narrowly ovate-lanceolate and the plant bears numerous racemes of small, white flowers, faintly flushed with lilac. Shown by Messrs. WALLACE AND CO.

COMPETITIVE CLASSES.

The groups of miscellaneous plants were a very attractive feature of the show, and they were arranged with considerable skill and taste. The first prize was won by A. P. BRANDT, Esq. (gr. Mr. J. W. Banks), Bletchingley Castle, with a charming arrangement of highly coloured Codiaeums (Crotons), *Lilium longiflorum*, *Tydaea amabilis* and various decorative Ferns. Dr. J. H. C. ROY (gr. Mr. A. Falconer), Mental Hospital, Cheadle Royal, was a good second, and he also employed Codiaeums to good effect. In the centre there was a batch of the graceful *Humea elegans*, while *Dracaenas*, *Gesneras* and well-coloured *Coleus* were also employed. Sir WILLIAM LAWRENCE, Bt., was third in this well-contested class.

Sweet Peas were the finest of the special flowers at the show, and competition was so strong that many really good collections were unplaced in the prize lists. In the open classes, the

first prize and Silver-gilt medal of the National Sweet Pea Society were won by F. W. FRANKS, Esq. (gr. Mr. W. Humphrey), Loampits, Tonbridge, with twelve superb vases of Sweet Peas. The chief varieties were Powerscourt, Youth, Magnet, Mammoth, Daventry, Constance Hinton and Picture. Major C. B. KRABBE (gr. Mr. A. W. Gower), Calcot Grange, Berkshire, was a very good second in this large class, and he had excellent vases of Coraline, Warrior, George Shawyer, Constance Hinton and Hebe.

In Division B, the best Sweet Peas were shown by W. HUFFEY, Esq., Boormans, Tonbridge, who had six magnificent vases of Magnet, Youth, Powerscourt and three other fine varieties. Dr. G. S. LEGGATT, Harpenden, was second, and he had beautiful vases of Magnet and Hebe. The same high quality was evident in Division C, where C. W. RENIN, Esq., Clewer, had splendid vases of Powerscourt, Hebe and Britannia.

The exhibits of Roses were of higher quality than, in view of the season, the judges anticipated, and there were many very good exhibits of exhibition and garden Roses. C. W. MANDER, Esq., Blacketts, Chorleywood, had the best twelve vases of exhibition varieties in the open classes, and he included blooms of George Dickson, *Etoile d'Hollande*, Mrs. Wakefield Christie-Miller and Augustus Hartmann of high merit. He was also first with six vases of Ramblers, showing Cupid, Carmine Pillar, Lemon Pillar and other useful varieties. The Rev. F. R. BURNSIDE, Stanbridge Rectory, had a show box of twelve magnificent blooms, including Madame Melaine Soupert, Dean Hole and Rev. F. Page-Roberts; and his six first-prize vases included splendid blooms of Ramon de Escofet, Mrs. Henry Bowles and Madame Melaine Soupert.

C. H. RIGG, Esq., Titley Lodge, St. Albans, had a very good show box of Roses in which he included George Dickson, Mrs. Henry Morse and Lieut. Chaure, of high quality. Mrs. CRIBB (gr. Mr. J. Stevenson), Northwood, who showed Paul's Scarlet Climber, Dr. Van Fleet and other varieties, was first in the class for six vases of free-flowering sorts.

The exhibits of cut sprays of hardy shrubs were very interesting and of great merit. In the class for twelve vases LIONEL DE ROTHCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Hants., and G. W. E. LODER, Esq., Wakehurst Place, Sussex, were placed equal first. The former had *Magnolia macrophylla*, *Olearia semi-dentata*, *Zenobia pulverulenta*, *Leptospermum Chapmanii* and *Carpenteria californica*. In his collection, Mr. LODER included *Leptospermum ericoides*, *L. scoparium* Nicholsii, *Veronica amplexicaulis* and *Callistemon salignus*. In other exhibits there were good vases of *Akebia floribunda*, *Magnolia parviflora*, *Abutilon megapotamicum* and *Robinia hispida* Hostii.

There were only two exhibits of twelve spikes of Delphinium, and that shown by Mrs. M. HAMILTON (gr. Mr. G. Smith), Kings Mead, Claygate, was decidedly the better. She had good spikes of Mrs. Townley Parker, Blue Bird, Robert Cox, and a blue seedling. In his second prize collection, H. K. FARNELL, Esq. (gr. Mr. E. H. Palmer), The Elms, Acton Hill, had good spikes of several seedlings.

Sir BRODIE HENDERSON (gr. Mr. W. Eggleton), Epping House, Hertford, was a good first with six vases of Perpetual Carnations, and he had excellent blooms of Topsy, Eileen Low and Laddie. Mrs. CARL HOLMES, The Node, Welwyn, included vases of Topsy and Brilliant in her second prize exhibit.

The best Border Carnations were staged by J. FAIRLIE, Esq., Acton, who showed splendid vases of Ravenswood, Mrs. Edmund Charrington and Sam Griffiths. Mr. R. MORTON, Woodside Park, was second, and he had good blooms of Gordon Douglas and Sam Weller. The only exhibit of six hardy Pinks, was an admirable collection from R. MORTON, Esq., and he deservedly received the first prize. His varieties were Model, Mrs. Pryor, Coronation, Mrs. George Walker, Lyric and Bridesmaid.

Considering the unfavourable season the exhibits of herbaceous Paeonies were very good. Sir BRODIE HENDERSON, who was first, had admirable vases of double-flowered varieties. C. W. MANDER, Esq., was placed second.

It was scarcely the best season for alpine in pots, and there were only two exhibits. The first prize was awarded to Col. GREY, Hocker Edge, Cranbrook, who included *Silene Hookeri* and *Primula facchinii*, two rare alpine, and *Gazania splendens*. 2nd Sir WILLIAM LAWRENCE, Bt. The first prize bowl of Water Lilies, shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Hants., contained fine blooms of *Escarboucle*, *Gladstonianum*, Mrs. Richmond and *Mooriana*.

The two first prizes for Rhododendrons were awarded to LIONEL DE ROTHSCHILD, Esq. Amongst his hybrids he had beautiful trusses of Madame Jules Porget and Mrs. L. H. Dunnett, while his species included *R. Griersonianum* and *R. didymum*.

Hardy herbaceous flowers and annuals made a very attractive display and, although the exhibits were mostly of the sorts to be seen in the average garden, they were well-grown. LIONEL DE ROTHSCHILD, Esq., was first in the open class, and he showed *Allium giganteum*, *Clematis integrifolia coerulea*, *Rhazya orientalis* and *Richardia africana*. W. B. CROSFIELD, Esq., Undercroft, Reigate, had the best collection of annuals.

Orchids were not largely shown, but the classes for flowering and foliage plants were very popular. F. C. STOOPE, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, was first with six excellent foliage plants of such sorts as *Caladium*, *Acalypha* and *Cordyline*. A. P. BRANDT, Esq., was a good second. T. CRAWFORD, Esq. (gr. Mr. G. Whiting), Whitehall, Bristol, was an easy first with six splendid double flowered, tuberous-rooted Begonias. The only exhibit of British Ferns was sent up by W. B. CRANFIELD, Esq., who had excellent specimens of such genera as *Polystichum* and *Lastraea*.

The class for nine flowering plants was disappointing. Sir WILLIAM LAWRENCE, Bt., was first, and he showed *Hydrangea Dumotii*, *Tillandsia Lindenii*, *Zephyranthes carinata*, while F. C. STOOPE, Esq., who was second, included plants of *Ixora*, *Hippeastrum* and *Richardia Elliottiana*.

At the end of the open amateur classes there were three classes which should have been especially interesting, but the exhibits fell a little short of expectations. The prizes which were offered should have been sufficient to attract quite good novelties. One class for a new species, introduced to cultivation since 1920, another was for a new garden plant raised since 1920, and the third class was for any plant not mentioned in the schedule.

The best new species was *Calceolaria filicaulis*, shown by Sir WILLIAM LAWRENCE, Bt., a *calceolaria* which has a certain resemblance to the Andean species, which received an Award of Merit a week previously. The leaves are similar, and the smaller flowers have the pouches flattened. Col. GREY was second with a small plant of the same species, but distinct in its greyish foliage. LIONEL DE ROTHSCHILD was placed third with *Rhododendron didymum*, a beautiful, reddish-maroon species from China.

The first prize new garden plant was a very handsome *Disa* hybrid, named "Pink Domino." There were several spikes, about three feet in height, bearing large flowers which had pink flushed standards and vivid rose-pink sepals. This was shown by Col. STEPHENSON CLARKE, C.B., Borde Hill, Cuckfield. The second prize was awarded to Mrs. CARL HOLMES, The Node, Welwyn, for a well-grown *Coleus*, and Sir WILLIAM LAWRENCE, Bt., was third, with a white variety of *Rehmannia angulata*. The class for a vase or pot of "any other plant" brought a variety of exhibits. Sir WILLIAM LAWRENCE, Bt., was first with *Strelitzia junceaefolia*; LIONEL DE ROTHSCHILD, Esq., was second with *Phormium tenax*; and Mrs. CARL HOLMES was third, with *Begonia cathayana*, a handsome foliage variety.

FEDERATION HORTICOLE PROFESSIONNELLE INTERNATIONALE.

NEARLY one hundred delegates attended the annual Conference opened at Geneva on June 20. The Conference commenced at 8.30 a.m., and the delegates represented Great Britain, France, Holland, Belgium, Germany and Switzerland. Proceedings commenced well on time, by a speech of welcome delivered by the silver-tongued M. J. Rochaix, a member of the National Council and Minister of the Interior and of Agriculture of the Canton of Geneva. The welcome over, M. J. Vachoux, President of the Association of Swiss Horticulturists presided, and to such excellent purpose that business proceeded swiftly.

Messrs. E. Laxton, H. T. Mason, W. E. Wallace, C. Engelmann, W. Clark, I. Godber, C. Du Cann, C. H. Curtis, J. S. Brunton and Evans were the British representatives; among the French representatives we noticed M. M. Barbier, Turbat, Rivoire, Grandorge, Sauvage, L. Levavasseur, N. Levavasseur and Rabier; from Holland came Messrs. Krelage, Ruys, Dykkus, Bonthuis and Mensing; while M. M. Pynaert, Braeckman, Temmermann and Haussens came from Belgium, and Messrs. Schetelig, Fachmann, Reischle and Blossfeld, from Germany.

The general report of the Secretary, M. Turbat, was accepted, and consisted chiefly of the minutes of the Paris Conference of 1926, and some correspondence. The Treasurer's report showed a balance in hand, but M. Sauvage pointed out that the International Bureau for the registration of new plants was not taken advantage of; indeed, only one plant—a new Rose from M. Turbat—was registered during the past year. In a subsequent discussion, it was agreed to continue the Bureau for another year and then, unless it is utilised for registration purposes, it will cease. The German delegates considered that no plant should be registered unless it had received an award from some authoritative body, but the Frenchmen asserted that registration was primarily for the purpose of securing a name for a new plant or seedling, so that the same name might not be used again; in short, to secure priority of name and prevent duplication. A Government registration bureau for new plants appears to be likely in Germany.

The question of admitting Austria to the Federation again came up for discussion, and the Conference agreed that if the Austrian Association could gather its professional horticulturists into one body, apart from amateurs, it would be admitted next year.

The reports of the condition of horticulture in the various countries concerned were taken next, but as most of them were already in print and had been circulated they were accepted as read. M. Pynaert referred to the increase of cultivation in Holland and Belgium, and asserted that unless the growers kept their plants thoroughly clean they would find the markets of other countries closed against them. M. Turbat complained that the reports were often received too late to be printed for the Conference, consequently the various national secretaries were admonished and bidden to do better in future so as to help the general secretary, M. Turbat, in his arduous duties.

Questions of the transport of horticultural produce were of more interest to the continental representatives than to the British, and a discussion concerning the need for co-operation so as to secure general international rates of carriage occupied a long period. Rates current in various countries are to be tabulated and an effort made to secure standard international rates, according to the kind of produce, i.e., perishable, heavy, bulky, etc.

Quite naturally a great deal of warmth was evident when pathological problems came under consideration, and one cannot help admiring M. Pynaert's persistent efforts to break down the American prohibition of imports on the ground of possible infection. The American quarantine regulations hit the Belgian and Dutch trade very hard, and now that bulbs are prohibited, Holland is more severely

affected than ever. The Dutch delegates pointed out that prohibition was being used to camouflage protection. The German representatives stated that if prohibition continued to increase—as it was increasing—Germany would have to adopt prohibitive measures as a form of protection to its own horticultural industry.

Eventually the following resolution was drafted and carried:—That the Associations affiliated to the F.H.P.I., considering that the growing extension of restriction and prohibitive measures constitutes a more and more formidable menace to the normal horticultural trade, and that international horticultural trade will be speedily destroyed if no solution is found to the present state of affairs, decides to follow out the programme of action established by the Conference of Paris in June, 1926. Further, that Article 6 of the Rome Convention should be amended as follows:—"Each country reserves the right to temporary prohibition where it is recognised that exports constitute a real infection to the country of importation."

This lengthy debate brought the morning session to a close, and an adjournment was made to the restaurant in the beautiful Parc des Eaux-Vives, close to the Lake of Geneva, where the delegates and their ladies were entertained to lunch by the State Council of the Canton of Geneva. There were the usual thanks and congratulations suitable to the occasion, and Messrs. Rochaix, Pynaert and Krelage were the principal speakers.

Matters did not progress so fast in the afternoon as an excellent lunch and lovely weather appeared to place some restraint upon the delegates. However, after several committees had presented their reports on special subjects and the auditors had passed M. Sauvage's accounts, the subject of customs' duties on horticultural produce occupied the attention of the Conference.

The subject of forming a European Customs Union was continued at the opening of the third session of the Conference, at 8.45 a.m., on Tuesday morning, when, it must be admitted the brilliantly fine morning tempted many of the delegates to wander by the lake at this early hour, although the majority arrived a little later. Most of the nationalities agreed to the formation of such a Union, but Germany did not assent, and the British did not vote on the question, preferring to reserve an opinion until the H.T.A. and B.F.F. had discussed it at home and, if necessary, conferred with the government departments concerned.

The discussion was carried on chiefly between the French and Belgian delegates. Belgium protested against the increased custom tariffs and disagreed with M. Turbat's statement that the situation in France—exchange, state conditions and need to protect the horticultural industry—necessitated the recent increase of customs' duties. M. Pynaert pointed out that even Germany had not increased its customs' duties on horticultural products since 1924, when the Mark was of unstable value, therefore one of the reasons given by France did not hold good; he suggested that the two Governments should confer for the purpose of considering tariffs and arranging reasonable customs' duties in connection with the horticultural industry. Germany, through Mr. Fachmann suggested that it would also have to raise tariffs, but the speaker reminded the Conference that at its meeting of 1926 there was a suggestion that the countries represented by the F.H.P.I. would confer on the tariff question, but nothing had been done. In regard to an European Customs Union opinions were divided, but the discussion was adjourned by M. Vachoux, who closed the session to enable the delegates to visit the Parc de l'Ariana, one of the beauty spots of Geneva, where there is also a wonderful museum containing collections of tapestry, paintings, carvings and beautiful china. In this building the Administrative Council of the town of Geneva gave a reception to the Conference delegates.

The relations between the horticultural industry and the respective governments were

considered, and resulted in a very interesting discussion. It was agreed that in every country someone definitely concerned with commercial horticulture should be attached to or directly associated with the Ministry of Agriculture, so that any advantages offered to agriculture might be obtained for horticulture. Apparently, elsewhere, as often happens in England, horticulture fails to obtain the privileges accorded to agriculture; nevertheless the Conference agreed with M. Rabier that horticulture should remain under the Ministry of Agriculture in each country, and that, at least, there should be a horticultural advisory committee attached to the ministry.

That horticulture should be directly represented at the Rome Convention was considered eminently desirable, and the various horticultural associations were advised to see that their government sent a horticultural representative to the next Convention. Apparently the Belgian Government will not send a representative, so the Belgian delegates asked Mr. Krelage to watch their interests for them at Rome. Mr. Krelage agreed to do so, but pointed out that of course, he would have no power to act officially on the part of Belgium.

Complaints were made that the Swiss papers would not receive advertisements from horticultural traders of other nationalities; it was ruled, however, that this was hardly a question for the Conference, which had no power to control the press of any country. We learned that the Swiss press has decided not to accept horticultural trade advertisements from other countries.

There was the usual talk about "dumping," but, apparently, nothing can be done to stop it, although each country has its black list of offenders, and those traders who sell wholesale in the general way and then dump their surplus on the purchasing country, are beginning to find that it does not pay them to do so because many of their regular customers object to such practice, and show their objection by withholding orders.

Many other matters were considered by the Conference, and there were numerous informal chats between traders of different nationalities, all of which tend to create and maintain good feeling. The Federation decided to hold its next annual Conference at Ghent in 1928, and appointed Mr. Charles Pynaert as President, with Mr. Edward Laxton as Vice-President for the ensuing year. Messrs. Turbat and Barbier were reappointed Secretaries. M. Turbat desired to be relieved of the duties, but was requested to continue, and to find some young enthusiast whom he could train to fill the post.

The National Secretaries agreed to assist M. Turbat so much as possible, and the Conference decided to reduce the amount of printing as a further relief. M. Sauvage was reappointed Treasurer, and then M. Rabier for France, M. Pynaert for Belgium, Mr. Krelage for Holland, Mr. Clark for Great Britain, and Mr. Schetelig for Germany, offered congratulations to M. Vachoux for presiding, and to the Swiss horticulturists for hospitality and general arrangements.

This concluded the actual Conference, but there was another lunch to attend, this time at the Hotel de la Société de l'Arquebuse et de la Navigation, where hospitality was offered by the Swiss Horticultural Association under the Presidency of M. Peter. In the afternoon, a visit was paid to the Cantonal Horticultural School, where there was another reception and tea was provided. An unexpected excursion to the top of La Saleve, on the French border, followed the visit to the school; from this eminence a grand view was obtained of Geneva and its lake and part of the plain of Savoy.

On the following day, June 22, the delegates were taken to view the more interesting places in Geneva, and in the afternoon they left by boat for Montreux, where on June 23, many of those who remained paid a visit to the Rochers de Naye.

YORKSHIRE FLORAL FÊTE AND GALA.

SEVERAL of the great Floral Fêtes, held in the Old City of York during the past thirty years, have been memorable for some special reason or feature—there was one the public never saw because a terrific gale demolished it. The three-day gala of 1927, however, will be kept in mind because its opening day—June 29—coincided with that rare celestial phenomenon, an eclipse of the sun, and with a great ecclesiastical function held to celebrate the thirteen hundredth anniversary of the stately old Minster that dominates the walled-in City. Thousands of visitors came to York for the Minster Celebration and the Gala, and many came so as to be in or near a position to see the eclipse; the latter were disappointed, as rain fell in the early hours of the morning, and after the rain, from six o'clock onwards, the sky was very overcast and glimpses of sunlight were obtained only at the end of the period of eclipse. So far as York was concerned, the eclipse as an attraction was badly staged.

The Gala was held at Knavesmire "without the City wall," and although the site is not so central as the old one at Bootham Park, it is more spacious, and as it belongs to the City there is always room for extension in this great open space should circumstances warrant it. The exhibition was a good one, the hardy flowers of early summer providing a feast of beauty and colour. Other good features were the ornamental groups of flowering and foliage plants, the rock and water gardens, Orchids and Roses. The non-competitive exhibits were numerous and beautiful, and particularly fine were the Sweet Peas arranged by Messrs. SUTTON AND SONS; LORD LECONFIELD'S splendid collection of vegetables; Mr. ENGELMANN'S and Messrs. ALLWOOD'S Carnations; Messrs. J. PEED AND SON'S Hydrangeas; Messrs. BACKHOUSE'S formal garden and flower-planted moat; Messrs. KENT AND BRYDON'S water garden; Messrs. TOOGOOD AND SON'S Gladioli; and Messrs. BLACKMORE AND LANGDON'S Delphiniums and Begonias.

Although the sky was somewhat overclouded, there were occasional bright periods when the show was opened to the subscribers and ticket-holders on Wednesday morning, punctually at noon, and there was a fair attendance of the public. The President, Col. Sir Edward Brotherton, Bt., presided at the lunch given to the judges and principal exhibitors. We hope the attendance increased, as such a good show was worthy of a good gate, and a good gate is one of the greatest encouragements to a hard-working committee such as is now managing the York show under the Chairmanship of Mr. H. L. Swift, with Mr. G. Johnson as Chairman of the Floral Committee.

Orchids.

Orchids were a pleasing feature, and the competition was good in most of the classes. The arrangement of the exhibits, whereby each competitor groups all his exhibits together and has class cards to show which is which, makes judgment far more difficult than when all the plants in each class are shown side by side. Moreover, visitors must find it very difficult to determine which prizes are awarded and which are not, as a second prize may be the earliest to present itself when the tent is entered, and the first prize exhibit may be round the corner of a bench of tabling.

MESSRS. J. CYPHER AND SONS obtained the premier award for a table of Orchids arranged on a space twelve feet by five feet; the arrangement was pleasing, and a few of the best plants were *Thunia Marshalliae*, *T. Magoniana*, the lovely *Vanda teres*, *Miltozia Charlesworthii*, and bright hybrid *Odontoglossums* and *Odontiodas*; J. MCCARTNEY, Esq. (gr. Mr. Potts), Hey House, Bolton, was awarded the second prize for a bright group of smaller plants, while Messrs. J. J. KEELING AND SONS were placed third.

The same competitors occupied similar positions in the class for a dozen Orchids in bloom, the Cheltenham firm's principal specimens being *Laelio-Cattleya Canhamiana*, *Thunia Marshalliae*, *Cypripedium Lawrenceanum*, and

the handsome *C. St. Alban*; Mr. McCartney's leading plants were *Miltozia Charlesworthii*, *Cattleya Falco*, *Laelio-Cattleya Canhamiana* and *L.-C. Isabel Sander*.

Mr. MCCARTNEY beat Messrs. J. CYPHER AND SONS for six Orchids, showing good examples of *Cattleya gigas*, with six flowers on a spike, *C. Hesta*, *Laelio-Cattleya Epsilon*, *Miltozia Hyeana*, and *Odontoglossum Cyrus*; Messrs. CYPHER'S best plants were *Laelio-Cattleya Wiganiana*, *Thunia Marshalliae*, *Cypripedium Rothschildianum* and *C. callosum Sanderæ*. For three Orchids, Mr. MCCARTNEY was again the most successful prize-winner, leading with finely-grown *Odontoglossum Orosius*, *Cattleya gigas* and *C. Dupreana superba*; Messrs. J. J. KEELING AND SONS, were second, and Messrs. J. CYPHER AND SONS, third. The Messrs. KEELING led for one specimen Orchid with a capital example of *Cypripedium Curtisii Sanderæ*, carrying ten flowers.

Mr. MCCARTNEY submitted the best six Orchids, and of these *Miltozia Charlesworthii* and *Cattleya Mossiae* were notably good. This was a class open only to amateurs, as were other classes, for three plants and one plant respectively, wherein Mr. MCCARTNEY carried off the premier awards, his three specimens consisting of a fine *Anguloa Cliftonii*, *Laelio-Cattleya Canhamiana* and *Cypripedium Rothschildianum*.

Groups.

Mr. W. HOLMES and Mr. T. M. PETCH were the only exhibitors in the class for a group of miscellaneous plants arranged on a space not exceeding three hundred square feet; each showed well, but Mr. HOLMES had the brightest exhibit, and made an elegant and attractive group of *Codiaeums*, *Liliums*, *Nandina domestica*, *Francoas* and a few Orchids.

MESSRS. JAMES CYPHER AND SONS secured the leading honours for a collection of plants arranged on a space sixteen feet by six feet, and the firm made a fine use, in their artistic effort, of bright *Codiaeums*, *Liliums*, bright *Fuchsias*, richly coloured *Selaginellas*, *Clerodendron fallax* and *Haemanthus*; Mr. W. HOLMES was second. In the class for a smaller group, Mr. HOLMES was the only exhibitor, and deservedly received the first prize.

Rock Gardens.

There was but one exhibitor in the class for a rock garden arranged on the ground, to be viewed all around and to occupy a space not exceeding thirty feet by fifteen feet. Mr. SAMUEL PICKERING, Clifton, York, was awarded the first prize for a pleasing design wherein dwarf *Piceas*, *Violas*, *Cheiranthus Allionii*, *Potentillas*, and *Sedums* were the principal subjects. A plant of golden *Privet*, however dwarf, is, we consider out of place in a rock garden.

A space of thirty feet by twelve feet was allowed for a rock garden in which water might be introduced at the discretion of the exhibitor. The schedule specified that no digging would be permitted, but as each competitor had sinned in regard to this regulation—and could scarcely do otherwise when introducing water into the design—the judges overlooked the error and awarded first prize to Mr. S. PICKERING, Clifton, York, and second to Mr. S. GARDINER. The former had a very attractive arrangement and provided a pleasing background of Maples and Bamboos for his well-furnished rock garden and pools of *Nymphaeas*. First-rate features were the colonies of *Sedums* and *Sempervivums* and the little moist valley with its drifts of *Mimulus*. By comparison, Mr. Gardiner's exhibit lacked brightness, and gave evidence of too severe a restraint in planting.

Hardy Flowers.

The hardy flowers were a great success, and there were four excellent groups in the competition for a collection of hardy perennials, including *Liliums* and other hardy bulbous plants, or cut flowers, or both, Roses excluded. A space not exceeding 350 square feet was allowed, so readers may imagine the fine effect the four exhibits provided.

Messrs. BEES, LTD., secured first prize with a splendid arrangement of flowers of high quality, in which the raised group of Delphiniums was magnificent, the large-flowered deep mauve variety named Hawarden Castle, and the deep purple blue Jenny Jones, being especially fine. The Paeonies, Kniphofias, Lilium croceum, Spanish and English Irises, Oriental and Iceland Poppies, Campanula Donald Thurston, Lupins, Pyrethrums, Gaillardias, Scarlet Sweet Williams and select forms of Chrysanthemum maximum were combined in a delightfully natural and pleasing manner, and the firm was awarded eighty-nine out of a possible hundred marks.

Messrs. HARKNESS AND SON secured the second prize with a display that contained magnificent Oriental Poppies in great variety, good Lupins and Linaria dalmatica, but their flowers were a trifle crowded, and the Delphiniums somewhat weak. Third prize went to Messrs. G. LONGSTER AND SON, Melton, for a pleasantly blended display of flowers of fair quality, their Foxgloves and Verbascum Longsteri being outstanding features; the last named is a very elegant plant, unusually graceful for a Verbascum, and carrying pale yellow flowers. Fourth prize was awarded to Messrs. G. GIBSON AND CO., Bedale.

Messrs. BEES, LTD., were equally successful for a collection of hardy flowers arranged on a space eighteen feet by seven feet, winning with a handsome group in which Delphiniums were again of exceptional excellence, while Paeonies were also very fine; Messrs. G. GIBSON AND CO., second; Mr. S. GARDINER, third, and Messrs. HARKNESS AND SONS fourth. Messrs. BEES, LTD., also contributed the best set of twenty-four bunches of hardy flowers, their principal subjects in this class being Paeonies, Delphiniums and Lupins.

Mrs. MILLINGTON, Burton Lane, York, showed the best set of a dozen bunches of hardy flowers, having, among other good things, Erigeron B. Ladhams, Spiraea Aruncus and Spanish Irises; Messrs. H. JUBB, Westfield House, Sykehouse, Goole, obtained the second prize in this good class.

The groups of Lupins were excellent, but the competitors should be placed on an equal footing by being compelled to arrange the flowers on the ground level, staging and boxes being disallowed. The finest spikes were shown by Messrs. J. D. HUTCHINSON, Kirby-moorside, whose exhibit was of first-rate quality, and by reason of elevated planks he was able to obtain some advantage in effect over Messrs. HARKNESS AND SON and Messrs. G. GIBSON AND CO., who came second and third respectively and arranged their exhibits in a very natural manner on the ground.

Roses.

There have been occasions when climatic conditions rendered it almost impossible to show Roses at York; there have been others when the Roses at York have been among the best of the season. This year the Roses were plentiful, and the competition good, but in many instances the fine blooms had suffered from the effects of rain and wind.

Messrs. JARMAN AND CO., Chard, showed the best of four sets of seventy-two blooms in not fewer than three dozen varieties. Their collection included good specimens of The Queen Alexandra, Mrs. H. Bowles, H. V. Machin, and Souv. de H. Beckwith; second Mr. ELISHA J. HICKS; third, Mr. H. DREW; fourth, Mr. G. BURCH. Mr. HICKS led for four dozen blooms in not fewer than twenty-four varieties, and showed capital flowers of Golden Emblem, Red Star, Rising Sun, and George Dickson; second, Messrs. JARMAN & CO.; third, Mr. H. DREW.

Messrs. JARMAN AND CO. gained first prize for thirty-six Roses, and their examples of Mr. H. Bowles, Lt. Chaure, and Golden Emblem were in fine form; second, Mr. ELISHA HICKS; third, Mr. H. DREW. Mr. GEORGE PRINCE secured the first prize for twenty-four Rose blooms, and in his set we noticed beautiful flowers of Duchess of Marlborough, Mrs. Courtney Page and Col. Oswald Fitzgerald; second, Mr. E. HICKS. The last named came to the front for eighteen blooms, and showed

George Dickson and Chas. E. Shea in fine condition; second, Mr. GEORGE PRINCE; third, Mr. H. DREW.

Other successful competitors were Mr. G. W. READER, Naburn Ferry, York, who won two first prizes; and Mr. W. HUTCHINSON.

Floral Designs.

The classes for floral arrangements are invariably well filled with clever and beautiful designs at York, and on this occasion there was no falling off, either in quantity or quality.

Messrs. ARLINGTON, Jameson Street, Hull, were particularly successful exhibitors in this section, and under this title they are new competitors. Our readers will, however, understand the reason of this success when we state that "Arlington" is but a pseudonym for Mr. Montague Stather.

This firm led for a hand basket of cut flowers with a gorgeous arrangement of brilliant Odontoglossums and Odontiodas, and were followed in order of mention by Mr. S. WARREN and Messrs. HEWITT AND CO. "ARLINGTON" was also written on the first prize card in the class for a hand basket of flowers, Orchids excluded, where the design was a handsome one in golden Arum Lilies and the deep steely blue Eryngiums; Messrs. HEWITT AND CO. gained the second prize with a pretty design in mauve Sweet Peas and yellow Roses. For a group of flowers suitable for a dining table decoration Messrs. ARLINGTON led once more, and this time used various Orchids and spikes of Statice Suworowii.

Using white Odontoglossums, white Lilies and Stephanotis, Messrs. ARLINGTON secured the premier prize for a bride's bouquet, charmingly arranged; second, Messrs. BACKHOUSE, with Cattleyas and Odontoglossums; third, Messrs. PADGETT AND WATSON, with white Odontoglossums, Carnations and Gladioli. For a bridesmaid's bouquet Messrs. ARLINGTON again held the winning card with an arrangement of mauve Sweet Peas and mauve and purple Cattleyas; second, Mr. G. WARREN; third, Messrs. BACKHOUSE.

The best pair of bouquets were those from Messrs. ARLINGTON, who had one of yellow and pink Carnations and one of white Carnations, Stephanotis and tiny sprays of double Gypsophila; second, Messrs. PADGETT AND WATSON; third, Messrs. HEWITT AND CO. Once more the ARLINGTON designs led, and this time in the class for one bouquet, where they submitted one of their best efforts, a lovely arrangement of Madame Butterfly Roses and natural Rose foliage; Messrs. BACKHOUSE won the second prize, and Mr. F. H. WARD the third prize.

Messrs. BACKHOUSE excelled for a bowl of Roses, using Golden Ophelia; Messrs. ARLINGTON second, and Mr. S. WARREN, third. Mr. WARD led for a bowl of flowers with a handsome arrangement of large crimson and pink Carnations, Messrs. PADGETT AND WATSON coming second with brilliant Clarkias, and Messrs. ARLINGTON, third, with mauve Scabious.

Vegetables.

LORD LECONFIELD (gr Mr. Streeter), Petworth Park, Sussex, contributed one of the finest—in many ways the very best—exhibits in the show. It consisted of about two hundred dishes of splendidly grown vegetables, representing a wonderful variety of produce for this time of year. The general arrangement was excellent, and the display was greatly admired.

In the few classes provided for vegetables, Mr. STREETER was the leading prize-winner.

Awards of Merit.

Delphinium Mrs. Paul Nelke.—Flowers of medium size and a lovely sky-blue shade.

Delphinium Lady Edith.—Flowers of large size and good form; mauve.

Delphinium Lady Elizabeth.—A pleasing variety of mauve and blue colour.

Begonia Albatross.—A magnificent double-white variety represented by a superbly grown plant. The foregoing were shown by Messrs. BLACKMORE AND LANGDON.

Medal Awards.

Large Gold Medals.—To Messrs. SUTTON AND SONS, LORD LECONFIELD (gr. Mr. Streeter), Mr. C. ENGELMANN, Messrs. BACKHOUSE, Messrs. KENT AND BRYDON, and Messrs. ALLWOOD BROS.

Gold Medals.—To Messrs. J. KELWAY AND SON, to Messrs. TOOGOOD AND SONS, to Messrs. W. HEWITT AND SONS, and to Messrs. J. FEED AND SON.

Silver-Gilt Medals.—To Mr. W. WELLS, JUNR., to Messrs. R. H. BATH, to Messrs. BACKHOUSE, to Messrs. WINN BROS., and to Messrs. BLACKMORE AND LANGDON.

Silver Medals.—To Mr. E. CLEGG, to Mr. H. ELLISON, to Messrs. JARMAN AND CO., to Mr. A. TODD, to Messrs. W. SIMPSON AND SONS, to Mr. P. ROGERS, to Mr. GARDINER, to Messrs. MAXWELL AND BEALE, to Messrs. BOWLES AND SKARRATT, to Messrs. BAKERS, to Messrs. WILSON AND AGATE, to Messrs. STORRIE AND STORRIE, to Mr. M. PRICHARD, to Messrs. UNWIN AND SON, and to Messrs. LOWE AND GIBSON.

READING AND DISTRICT GARDENERS.

THE first meeting of the summer session was held by the kind permission of Mr. Lawrence Currie, at Minley Manor, Farnborough, on Monday evening, June 13. The outing was favoured with fine weather, and nearly one hundred members were present. The party was received by Mr. Harold Wright, the gardener, and under his guidance and several members of his staff, an inspection was made of the gardens and grounds. Minley Manor is noted for its extensive ornamental grounds, and the ramble through these was much enjoyed. Magnificent views are obtained from the hill near the church across Laffen Plain to Aldershot. The outing was greatly enjoyed.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THE members of the Glasgow and West of Scotland Horticultural Society, to the number of one hundred, had an outing in Ayrshire on Saturday. Proceeding by motor, they first visited Ayr, where luncheon was served, and afterwards journeyed to Ballochmyle House to inspect the gardens. On the way home a halt was made at Barskimming, the residence of Mr. Dunlop, and under the guidance of Mr. Currie, gardener, the company inspected the spacious grounds and gardens. Rhododendrons were in full bloom and made a lovely show, but the chief attraction was the long stretch of herbaceous borders. Tea was afterwards served in two marquees on the lawn, and before departing Mr. Thomas Dagg, Chairman of Directors, expressed on behalf of the Society, their appreciation of Mr. and Mrs. Dunlop's kind hospitality.

ROYAL CALEDONIAN HORTICULTURAL.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on the 7th ult., Mr. W. J. Thomson, President, in the chair.

Reference was made to the loss the Society had sustained by the death of Mr. David King, one of the Vice-Presidents, who for two years was President of the Society, and for a number of years a member of the Council.

A lecture, illustrated by lantern illustrations, was delivered by Sir Everard Imthurn, K.C.M.G., K.B.E., on "Palms in the Tropics," in which he had spent thirty years—twenty in Guiana and ten in Ceylon and the South Sea Islands. He stated there were no fewer than seventy species of Palms, represented by twenty-one genera, native to Guiana, of which two or at the most, three only, had fan-shaped leaves. Perhaps no country of equal size was so rich in Palms. Neither in Ceylon nor in the South Sea Islands was there such a wealth of species. The Cocoa Nut Palm, however, was now the most widely distributed of all.

The exhibits were: Tulips, from Messrs. DOBBIE AND CO., Edinburgh, awarded a Silver Medal; Cauliflowers, from Mr. J. W. SCARLETT, Inveresk, Award of Merit; Primulas from Mr. CLOAD, Kinmount Gardens, Annan, Dumfriesshire, awarded a Cultural Certificate.

WADHURST ROSE AND SWEET PEA SHOW.

THE second annual Rose and Sweet Pea show of the Wadhurst Gardening Association was held on June 22. Started last year in the Memorial Hall, the exhibits this year filled in addition a large marquee. The increase in quality was as marked as the increase in quantity, and won congratulatory comments from the judges. The Courthope Perpetual Challenge Cup for Roses was won by Mrs. A. V. DRUMMOND, Bassetts, Mark Cross; the Sharp Perpetual Challenge Cup for Sweet Peas, by Mrs. WELLINGTON WILLIAMS, Shernfold Park, Frant; the National Viola and Pansy Society's Bronze Medal, by Captain and Mrs. NORMAN SNELGROVE, Marling Place, Wadhurst; and the Certificate of Merit by Mrs. R. SHARP, of Woodhill, Mayfield. The *Gardening Illustrated* Medal, offered to the winner of the highest number of points, was won by Mrs. DRUMMOND. Other prize winners were Mrs. L. K. JONES, F. W. FRANKS, Esq., Tonbridge, G. H. SHAKERLEY AKERS, Esq., Doddleswell Manor, near Uckfield, Sir AUSTIN CHAMBERLAIN, K.G., M.P., JOHN L. REID, Esq., Maplesden, Ticehurst, and Sir DERRICK WATSON, Burwood, Groombridge. The Hon. Secretary, Miss MOUTRAY READ, exhibited a fine plant of *Primula Florindae* in a non-competitive class, which was Highly Commended. The syringe presented by Messrs. Abol for the most popular exhibit was won by Captain and Mrs. NORMAN SNELGROVE for a collection of hardy flowers.

Obituary.

George Mair.—The death took place on Thursday (23rd ult.) of Mr. George Mair, nurseryman, Prestwick, whose name is prominently associated with the work of raising Gladioli. Born in the little Aberdeenshire village of Fyvie, in 1841, he received his early training in his native county, and afterwards gained additional experience at Lanfine, and Kirkmichael House, in Ayrshire. Something like forty-six years ago, he acquired a small nursery with a single glass house at Prestwick, and about 1893 he resolved to specialise in Gladioli. It was an uphill struggle at first, but success ultimately attended his efforts, and now 10,000 seedlings are raised annually, and Mr. Mair's varieties are distributed all over the world. As an exhibitor, Mr. Mair possessed a wonderful record. For nearly forty years he staged Gladioli at the shows of the Glasgow and West of Scotland Horticultural Society, and during that long period he only failed on one occasion to secure the first prize award. Despite his business activities, the deceased gentleman devoted much of his spare time to public affairs. For a number of years he served as a member of the Town Council, Parochial Board and Parish Council, and besides being a Justice of the Peace he was the senior elder of Monkton and Prestwick Parish Church. As the business progressed, additional land was acquired at Glenburn, where a feature was made of Hydrangeas, Pelargoniums and Sweet Peas, and although three sons were associated with him in the management, Mr. Mair continued to take an active part in the business until laid aside by illness.

TRADE NOTE.

ANY of our readers requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Rayner & Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

ANSWERS TO CORRESPONDENTS.

FASCIATED MARIGOLD.—G. B. It is not uncommon to find specimens such as the one you enclose. The condition is sometimes known as "Hen and Chickens," and is fairly common in Composites, Hen and Chickens Daisies being a good example.

GOOSEBERRY LEAVES SPOTTED.—J. B. The spots on your Gooseberry leaves are those of a fungous pest known as Cluster-cups, or *Puccinia pringsheimiana*. No remedy has as yet been found for it, and all affected leaves and fruit should be gathered and carefully burnt.

GRAPES SPOTTED.—O. B. B. The berries are affected with spot disease caused by the fungus *Gloeosporium ampelophagum*. Spray with liver of sulphur at a strength of half-an-ounce in two gallons of water, or dust flowers of sulphur on the leaves and bunches, and again at an interval of ten days. Next winter, when the vines are dormant, spray the rods with iron sulphate in solution.

HYDRANGEAS.—A. F. J. The blue colour in Hydrangeas is not natural, but is produced by introducing sulphate of iron into the soil. Where the soil is quite free from iron, Hydrangea flowers are naturally of a pink or red colour. Presumably up to the present you have been watering the soil with some preparation to produce the blue colour, and if you discontinue doing this the flowers will gradually return to pink or red.

MELONS DISEASED.—E. L. The disease attacking your Melons is a fungus, *Stemphylium cucurbitacearum*. Very little is known about it, but seeds which have germinated slowly are more liable to infection than those of more rapid growth. The seedlings and soil should be burned. —M. L. The Melon plant submitted for examination is suffering from *Fusarium* wilt. The fungus was present in the bed and after entering the root it grew slowly up the stem in the wood vessels turning them a brown colour and causing the leaves to wilt. You should pull up infected plants so soon as they appear and burn them. Prevention of this disease in the future will depend upon the use of disease-free soil and manure. The house should be thoroughly cleansed in the winter and washed down with emulsified cresylic acid. If you are growing the Melons in beds placed directly on the floor of the house it will be necessary either to steam or to treat with formaldehyde the soil upon which the beds are to be placed. When making up the new beds you should either use soil from a new source or sterilise your present supply by steam or by formaldehyde.

MINT AFFECTED.—B. J. B. Your Mint is affected with Mint Rust (*Puccinia menthae*). You cannot cure the plants which are already affected, as the mycelium persists in the underground portions of the Mint as well as in the top growth. Your best plan will be to dig up and burn the plants next season, and make a fresh Mint bed on land as far as possible from the old one. Spraying the affected plants with a rose-red solution of permanganate of potash will serve to keep the fungus in check and destroy the spores.

MOSSY, SLIMY GROWTH IN LAKE.—J. D. Colledge. One pound of sulphate of copper to 100,000 gallons of water should be used in ponds or lakes that contain fish. The weed of which you complain is most likely one or more of the species of fresh water *Vaucheria*, which grows very rapidly in still water, whether in lakes, ditches or in wells fed by spring water. The number of fine filaments is often so great that it would take a fair amount of the sulphate to kill them, though in the above proportions the experiment has been favourably commented upon. Ponds that contain much mud in the bottom are favourable to this Algae, which reproduces

itself in a variety of ways, and send spores and zoospores into the water in enormous numbers. In some cases ponds have been run dry and the mud cleared out with highly beneficial effect. In other cases some sort of drag has been attached to the end of a boat for clearing off the thick masses of the weed, and this is worth trying two or three times a season. Swans, geese and other water birds devour a great deal of this and other water weeds.

NAMES OF PLANTS.—G. S. 1, *Sedum album* variety; 2, *Mesembryanthemum amoenum*; 3, *Lysimachia vulgaris*; 4, *Juniperus chinensis*. *Constant Reader*. 1, *Myosotis* species; specimen too scrappy to identify; 2, *Lychnis chalcedonica*; 3, *Geranium phaeum*; 4, *Allium Moly*; 5, *Veronica* species; specimen, too scrappy; 6, *Deutzia scabra*; 7, *Salvia Horminum*. A. J. D. *Rhododendron ferrugineum* (the alpine Rose).

NECTARINES SPLITTING.—S. G. As you are sure your Nectarine trees have not suffered either from lack of lime in the soil or for want of water at the roots, we are inclined to think the cracking and rusty appearance of the fruits has been caused by an excess of atmospheric moisture. Peaches and Nectarines love moisture, but too much atmospheric moisture in cold houses is a mistake. Do not syringe with cold water when the sun is powerful, or so late in the afternoon that the fruits and foliage would not become dry before night. It is possible that thrips have contributed to the cracking and rusty appearance of the fruits, although we failed to detect any on those sent.

ONION BULBS ATTACKED.—H. R. S. W. Your Onion bulb is attacked by the "White-rot" disease caused by a fungus *Sclerotium cepivorum*. Onions should not be grown in infected soil for eight or ten years and, during that period, the soil should be well cultivated, care being taken not to transfer contamination to clean Onion beds. The diseased plants should be taken up immediately and burned. It is a good plan to remove the entire bed, soil and all, which should be burned by spreading it over a heap of burning rubbish. No variety of Onion is known to be immune. Shallots are resistant and Leeks are rarely infected.

PEACH LEAF CURL.—S. J. The disease cannot be cured, but it may be prevented another year by spraying in early spring, say, in February, before the buds swell, with either Bordeaux or Burgundy mixture. The following double strength Burgundy mixture has given good results:—Copper sulphate, 2½ lbs.; carbonate of soda (crystals), 2½ lbs.; water, twelve gallons.

PROLIFICATION IN CHERRY.—A. S. and S. The abnormality in your sprig of Cherry is known as proliferation, and is caused by the growing point continuing to develop beyond the flower, instead of ending in the flower as in normal cases. The condition, though abnormal, is not uncommon, and is fairly frequently met with in Roses.

VINE LEAVES WITH WARTY GROWTHS.—B. H. C. The very small swellings on the lower surface of the leaves are intumescences, which are produced naturally by the vine when under rather damp conditions. The trouble is not Black Rot. The swellings are green at first and later turn brown. Maintain a drier atmosphere and ventilate more freely.

TULIP BULBS.—J. S. T. Your Tulip bulbs are attacked by *Botrytis*. The spores of this fungus are air borne and may be carried to healthy plants from neighbouring diseased ones. Quite frequently, however, the bulbs themselves are infected before planting. Small, black sclerotia may be observed among the outer scales of the bulb. The bulbs should be well dried and the infected scales removed before planting.

COLOURED SUPPLEMENT PLATE.

Nepenthes Mastersiana.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 63° 1'.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 6, 10 a.m. Bar. 30.0. Temp. 66°. Weather, Fine.

THAT exploration of any sort is a high adventure, nobody will deny. The lure of the unknown is irresistible, and at its call men go forth to seek their fortunes with a careless rapture. But the height of adventure is reached in the exploration which involves travel "off the map." There is ample geographical work (in the restricted sense) still to be done, but something more is expected of the modern traveller than to be able to travel and construct a map; he must needs discover something more than new rivers and mountains if he would make his mark. For the truth is, the relative positions of pioneer and scientist are now reversed. Formerly the pioneer dabbled in botany, or zoology, or geology, annexing with myopic eye such specimens (often lacking in essential parts) as came within his purview. To-day, botanist, zoologist and geologist have turned explorer, and, still breaking new ground, they not only collect with discrimination specimens of the fauna and flora, but solve fundamental

problems of their architecture, or reconstruct their past histories. Of all professional explorers, perhaps the life of the plant-hunter is the most exacting and the most interesting. His very work keeps him in the field much longer than is required by most investigations, and botanical and geographical exploration usefully supplement each other. It is impossible to say what special qualities or training the future plant-hunter requires; perhaps he requires none, other than a sound constitution, a love of flowers, and an iron determination to be an explorer and nothing else. Between 1840 and 1900, Messrs. James Veitch and Sons employed twenty-two collectors, men of diverse character and upbringing; nor does this list include those two outstanding and romantic figures, Douglas and Fortune. Most of these men were successful, and probably the only qualities they had in common were keenness and adaptability. The power of adaptation to circumstances, however uncomfortable, really depends entirely upon a personal sense of values. No reasonable man willingly mortifies himself under the mistaken belief that he is taking a cure; but discomfort and danger in greater or less degree are the common lot of the plant-hunter. If he believes that the only thing that really matters is to deliver the goods and solve such problems as he has set himself to solve, then he will regard this as all in the day's work, and not bother himself. If, on the other hand, he believes that his personal comfort has a first call on the investment, then—although we hold strongly that he should look after himself as thoroughly as circumstances permit—the work must suffer. The dearest asset the plant-hunter can possess is a sound constitution, for he will try it hard; without it he cannot hope to withstand climatic and other difficulties. As for knowledge, the world is his university, but the most valuable is a knowledge of his job, and that, perhaps, can only be learnt in the field. It is easy for the uninstructed to say that anyone can collect plants, because, as a matter of fact, most of us do. But the collector, unless he understands his business, will infallibly collect the wrong ones. That it sounds easy is a tribute to its difficulty, for it is the hall-mark of efficiency that everything works as smoothly as if it were running on oiled bearings, and efficiency is not attained without long practice. Not until things go awry does the master of craft reveal himself, and economy of effort is the prelude to success. But the romance of botany is not primarily the romance of the plant hunter. To him, indeed, is the adventurous life; but the most fecund achievements are those connected with the founding of the great plantation industries—the Rubber industry of Malaya, the Tea plantations of India, the Cinchona estates of Java and Ceylon, and many more, all sprung from the vision and enterprise of a few great men. And this cultivation of valuable tropical trees is in its infancy. From the earliest times men have carried their food crops with them from one region to another, till now the staple foods of the world are universally distributed, and none knows whence they first started on their travels. Maize, Rice, Wheat, the Banana, the Coconut and other food plants now girdle the earth. They are geographical factors of deep importance, and their present broadcast distribution has a profound effect on the history of mankind. But the scientific cultivation of plants yielding drugs, oils, gums, soaps, fibres, and a hundred other valuable economic products on a commercial scale is a modern development, and one which opens up immense possibilities. Here, indeed, is a

limitless field for adventure and discovery. The establishment of plantations is but the first step; nay, it is not even that, for it is first necessary to find the plant, and convince men that it will contribute something to their happiness and comfort, either for utilitarian or aesthetic ends. The plant may be rare, or in danger of extermination, or an entirely new discovery, or possessed of some quality which renders its introduction into a certain district desirable. There are a dozen angles from which we may look at an economic plant, in order to harness it most usefully to our needs. As for the possibilities of new plants, or of new uses for old plants, they appear to be endless, and there are vast problems ahead for the explorer, the research worker, the planter, the merchant, and all the liaison services connected with big industry. Suppose, then, that we have established our plantation. For a time all goes well, there is no hint of the coming struggle. But if we look at the matter squarely, we shall see that there must come a tussle, and that the fight will be a continuous one, since Nature never stands still. She is for ever forging new weapons, not especially for man's discomfort, but for her own advantage. From man's point of view, a certain amount of useless jungle has been cleared to make room for plantations of useful trees. But Nature looks at the matter differently. For thousands of years she has been nicely holding the balance between a number of forces; sometimes one makes headway, sometimes another, but the balance is soon restored automatically, and on the whole a position of equilibrium is maintained. Now comes man and rudely upsets everything again. Incalculable elements have been introduced, and the result cannot be foreseen, though we may be sure Nature will take the shortest cut to re-establish equilibrium. What has happened is that a new and untried host has been introduced, and after a lull, during which potential enemies are making a reconnaissance in force, the struggle breaks out with renewed fury. Birds and animals, plants and insects, and those organisms which are below the border line of differentiation, advance to the attack, or to ally themselves with the newcomer in defence. An old and discredited foe emerges from ambush, new enemies appear from outside, and in a very short time the struggle becomes general; unless, therefore, man, whose selective activity has precipitated a new conflict, organises an adequate defensive, he may bring a hornet's nest of trouble about his ears. In this way the Coffee plantations of Ceylon were ruined. The West Indian Banana crop is to-day threatened with extermination, and the American Cotton crop suffers frightfully from the Boll Weevil. In this country we have Silver-leaf trouble, Gooseberry Mildew, Potato blight, and other serious epidemic diseases, which are only kept in check by the most drastic action and unremitting watchfulness. Even so, the losses are serious. Besides the perpetual defensive-offensive warfare waged against plant enemies, there is also the constructive side of agricultural botany. This includes the breeding of Wheats which will give a bigger yield per acre, or ripen earlier in the year, or carry a heavier straw, or resist Rust disease; the selection and crossing of sound stocks for fruit trees; the combination of desirable qualities, at present found in two species, in one, and the elimination of undesirable qualities. This is the specialist's work, but it must be remembered that the material on which he works is often the result of some collector's discovery, perhaps a chance specimen from a remote corner of the world; and that he does deliberately

and according to formula what the native has perhaps done empirically for centuries. In this way the great plantation industries which give work to thousands at home and abroad, have been built up. When we look at the Orange groves of South Africa, the Vineyards of Australia, and the fruit farms of Canada, we begin to perceive the potentialities of exploration—and therein lies the future Romance of Botany and Horticulture.

Our Coloured Plate.—The Coloured Supplement to the present issue presents an illustration of one pitcher of *Nepenthes Mastersiana*. Although *Nepenthes* are not grown so frequently in private collections as formerly, they still constitute one of the great attractions at Botanic Gardens, and wherever they are cultivated the handsome *N. Mastersiana* is always to be found, as it is easily managed, and a specimen of fair size makes an attractive display when the new pitchers have fully grown and developed their rich crimson colouring. *N. Mastersiana* is the result of crossing *N. sanguinea* with *N. khasiana*, by Messrs. J. Veitch and Sons, and when the hybrid was exhibited in 1882, the Royal Horticultural Society awarded it a First Class Certificate. *Nepenthes Mastersiana* was named in compliment to the late Dr. Maxwell T. Masters, for many years editor of *The Gardeners' Chronicle*.

The Fruit Crops.—Will correspondents who have kindly furnished us in the past with reports on the fruit crops notify the Editors of any change of address. We shall be pleased to send a form to any reader specially interested in fruit-growing; application should be made to the Editorial Department.

The Beauties of the Thames Valley.—The Council for the Preservation of Rural England has convened a Conference for July 7. This will be held in the Shire Hall, Reading, when lord-lieutenants, representatives of local authorities, landowners and others will consider how best to preserve the natural beauties of the Thames Valley from Oxford to Windsor. This is the first big Conference of its kind, and as a result, the formation of a special committee is anticipated to watch all proposals that might spoil the amenities and beauties of the River Thames.

Presentation to Mr. Charles F. Harding.—For thirty years, Mr. Charles F. Harding has been a member of the Committee of the United Horticultural Benefit and Provident Society, and during that long period he has rendered splendid service in connection with the rules and regulations of both State and Private Sections. As a mark of their appreciation and in acknowledgment of these services, the members of the Society have presented Mr. Harding with an oak writing table, and Mrs. Harding with a leather hand-bag. The formal presentation was made by Mr. C. H. Curtis on July 4, when the officers and members of Committee and a few personal friends entertained Mr. and Mrs. Harding to dinner at the Windsor Castle Hotel, Westminster. Mr. Harding is an old Chiswick student, and is now engaged in market gardening at Shiplake, Oxon.

Flowers in Season.—From Messrs. Allwood Bros., Wivelsfield Nurseries, Haywards Heath, we have received a selection of Carnations in which the firm specialises, and to whom we are indebted for new races, including the floriferous *Dianthus Allwoodii* and hybrids from such alpine species as *D. deltoides* and *D. alpinus* crossed with *Dianthus Allwoodii*. These last are very floriferous, for they have a perpetual flowering habit, and are useful for planting on rockeries, walls, terraces, etc. Six of these Allwoodii alpinus varieties, as they are termed, were included, viz., Puck, white with a maroon eye; Ariel, blush mauve, with lacing of deeper colour in the centre; Titania, deep maroon; Oberon, pale cerise with a maroon centre; Tinkerbell, pale pink; and Wendy, violet-purple. Three new *Dianthus Allwoodii* were sent in; Sylvia, salmon-pink with deeper lacing

of the same colour; Pat, bright pink; and Phoebe, a variety with fragrant salmon blooms. Many border Carnations and perpetual border varieties were outstandingly beautiful, amongst them Rosalind, pale yellow flecked with red; Supreme, flesh pink; Skirmisher, yellow flushed with mauve and flaked with pink; Centurion, yellow ground with scarlet markings; and Douglasdale, light orange-vermilion. Of their new perpetual-flowering varieties they included Wivelsfield Copper, an unique shade of coppery-bronze; Velvet, maroon and crimson on a light fawn ground; Butterfly, white ground with crimson markings; and Splendour, vermilion, a very fine novelty.

Mr. J. Duncan Pearson.—The youngest of three well-known brothers, Mr. J. Duncan Pearson has been connected with the seed and bulb business for more than forty years, and during that time has made a hobby of growing and raising Daffodils. When he joined his brothers in the firm of Messrs. J. R. Pearson and Sons,

MR. J. DUNCAN PEARSON.

no bulbs were grown at Nottingham, but having caught the Daffodil fever when still young, he gradually worked up a small collection, and went the length of spending some £60 of his hard-earned savings in getting a collection of his own. With this little collection he made a start in cross-fertilising and raising seedlings. Not very much success attended these first efforts, as the stock was small and contained nothing but obvaris, poeticus ornatus, Henry Irving and such like things, but when the firm moved from Chilwell to Lowdham, a better soil encouraged him to go in for some of the newer varieties and work upon them for further improvements. He remembers his brother coming back from Holland and saying he had bought Madame de Graaff at £5 per bulb, and Glory of Leiden at £4; later an offset of Weardale Perfection was acquired for £12, which was then considered a very high price to give for a single bulb. In later years, however, Mr. Pearson frequently paid so much as £30 to £50 for a really good thing. Perhaps his greatest early success was a cross between Madame de Graaff and Minnie Hume, which gave a large number of Giant Leedsii forms, which were at that time very few in number. Some of these, such as Lowdham Beauty, Hon. Mrs. Franklin, Norah Pearson, etc., have now become quite popular; and as they all increase quickly, the stocks have—in spite of sales—run from odd bulbs into many thousands. Another cross, Emperor × Madame de Graaff, which gave Florence Pearson, a pale, bicolor trumpet, is now grown almost everywhere where Daffodils flourish, including New Zealand. Only five seeds resulted from this cross, so it

was very good luck to get even one good variety from it. Mr. J. D. Pearson is one of the oldest members on the R.H.S. Daffodil Committee, and he was on familiar terms with Peter Barr, F. W. Burbidge, Ernest Crossfield, Robert Sydenham, Rev. Bourne, Rev. J. Jacob, Walter Ware, and J. Kingsmill. Mr. Pearson has almost given up the fascinating pursuit of hybridising which is now done mostly by his nephew, who is full of youth and vigour. He believes the Daffodil will never lose its favour with the public and will always have real enthusiasts to look after its welfare in every way.

New Rose Garden for Brooklyn.—The Brooklyn, New York, Botanic Garden has received the munificent gift of \$10,000 from Mr. Walter C. Cranford, for the purpose of forming a Rose Garden, a project which Rose lovers in New York, and especially the members of the American Rose Society, have long desired to accomplish. The plans have already been worked out by the consulting landscape architect of the garden; the garden is to be approximately 500 feet by 100 feet, and will contain a collection of Roses of all the most important types in as many species as possible. The wide interest taken in the garden makes it certain that generous donations of plants will be forthcoming, and it is hoped that many varieties will be planted before the close of the present season.

Chicago's New Flower Market.—On Thursday, June 16, the new wholesale cut flower market in West Randolph Street, Chicago, was officially inspected, over one thousand visitors going over the building. Great admiration was expressed at the concrete floors, the large windows providing abundance of ventilation, the light grey stucco walls and columns, and the automatic lifts to all floors. Paeonies were chiefly in evidence among the flowers on sale, Roses and Carnations being also in wonderful abundance for the time of year. On the roof of the building is an extensive conservatory, where decorative plants can be housed.

American Iris Society's Meeting.—The eighth annual meeting and outing of the American Iris Society took place on June 3, over a hundred members and guests taking part. Mr. J. C. Wister, the President, occupied the chair at the meeting, which was held in the Laboratory of the Brooklyn Botanical Garden. Some interesting discussions took place on subjects of interest to Iris growers, and after lunch the members visited the Iris garden of Mr. Robert Wayman, at Bayside, and that of Mr. A. A. Havemeyer, at Brookville. A remarkable fact is that in the United States, whereas amateurs are very enthusiastic growers of Irises, nurserymen are slow to take up these flowers, and do not consider them profitable, so that the trade is largely in the hands of a few specialists, some of them more or less amateurs themselves.

R.H.S. Gardens Club.—The annual meeting of the R.H.S. Gardens Club will take place at Burford, Dorking, by the kind permission of Sir William Lawrence, Bart., at 2.30 p.m., on Saturday, July 16. Sir William and Lady Lawrence have very kindly invited members of the Club to tea. There are electric trains from Waterloo at five and twenty-five minutes past each hour to Box Hill Station, which is close to Burford. Members proceeding from Wisley will visit the nurseries of Messrs. V. N. Gauntlett, Ltd., at Chiddingfold, during the morning. A motor-coach will leave Wisley at 9.15 a.m. sharp. There are a few seats available at 6/-, which should be booked without delay. Lunch will be taken at Guildford, members making their own arrangements. Members of the Club are asked to inform the Hon. Secretary, Mr. W. Cartwright, R.H.S. Gardens, Wisley, Ripley, Surrey, of their intention to attend the meeting at Burford.

Sweet Pea Show in Brussels.—The recent Sweet Pea show held in Brussels was a great success, and reflected the greatest credit on the Society ("Les Amis du Pois de Senteur") responsible for the arrangements. It was held in the Orangery of the Botanic Garden, but this venue proved to be too small for the larger

numbers of excellent exhibits sent. The President of the Society is M. Firmin Lambeau, a personality too well-known in Belgian and other horticultural circles to require introduction, and certainly the Exhibition—only the fourth which this very young Society has held—must have caused him much gratification. One of the objects which the Society has set before it is to popularise the growing of Sweet Peas among school children, and that this end has been at least partially attained was shown by the fact that among the exhibits were those of twenty-seven scholars of the Forville school. Three foreign exhibitors were also present—Messrs. Dobbie and Co., of Edinburgh; M. Carlée, of Heemstede, Holland; and Mlle. Cushing, from near Fontainebleau, France. The Exhibition was opened on June 29 by M. Bauwens, the Inspector General of Agriculture, and on Sunday morning the Queen of the Belgians, whose love for flowers is well-known, visited the show, and was presented with beautiful bouquets of Sweet Peas by the two little daughters of M. Van de Weyer.

Forthcoming Dutch Flower Show.—On July 22, 23, and 24, an Exhibition of Roses, Sweet Peas and Carnations will be held in the Zoological Gardens at The Hague, Holland. Silver Cups and other valuable prizes will be awarded, and the show is expected to arouse much interest both among amateurs and professionals.

Women's Farm and Garden Association.—The annual meeting of the Women's Farm and Garden Association was held in a special tent at the National Rose Society's show in the Chelsea Gardens, on July 1, at 3 p.m. H.R.H. Princess Louise, Duchess of Argyll, presided. The speaker was Lieut. Col. Sir David Prain, C.M.G., C.I.E., M.A., M.B., LL.D., F.R.S., F.L.S., Superintendent of the Royal Botanic Gardens, Calcutta, and Director of the Botanical Survey of India until 1905, Director of the Royal Botanic Gardens, Kew, from 1905 until 1922. A satisfactory report on the year's work was read.

German Garden Architect for Turkish Capital.—Otto Werner, a landscape gardener of Friedenau, Berlin, has been invited to go to Angora, the new capital of Turkey, to superintend the laying out of the very extensive public gardens in that town.

Retirement of a Glasgow Gardener.—We learn that Mr. Harry Reid, gardener at Ruchill Hospital, Glasgow, is retiring from the position he has held since the institution was opened in 1900. Mr. Reid was a director of the Glasgow and West of Scotland Horticultural Society for the long period of thirty-five years, and only gave up office at the last annual meeting.

Honours for Dutch Horticulturists.—The President of the French Republic has bestowed the rank of Officer of the Order of "Mérite Agricole" on Messrs. J. C. M. Mensing and C. Thim, the two Dutch growers who were chiefly responsible for staging at the recent Centenary Show in Paris the very beautiful Dutch groups, which aroused the greatest admiration of all who saw them.

Appointments for the Ensuing Week.—**MONDAY, JULY 11:** United Horticultural Benefit and Provident Society's meeting. **TUESDAY, JULY 12:** Peterborough Agricultural Society's show (three days); Roundhay (Leeds) Horticultural Society's show (two days); Wolverhampton Floral Fête (three days); Herne Bay Horticultural Society's show; Tunbridge Wells Gardeners' Association's show; Jersey Gardeners' Society's meeting. **WEDNESDAY, JULY 13:** Liverpool Horticultural Association's show (two days); Guildford and District Gardeners' Association's show; Sussex County Agricultural Society's show at Chichester (two days); Gravesend and District Rose, Carnation and Sweet Pea Society's show; Hereford and West of England Rose Society's show; Sheffield Chrysanthemum Society's meeting. **THURSDAY, JULY 14:** Horticultural Club outing to Wisley; Kent County Agricultural Society's horticultural show in Knole Park, Sevenoaks (three days); Wid-

combe (Bath) Sweet Pea Show. **FRIDAY, JULY 15:** National Rose Society's show. **SATURDAY, JULY 16:** Elstree Horticultural Society's Show; Dundee Horticultural Society's outing; Virginia Water Horticultural Association's show; Ainsdale Horticultural Society's show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Torenia asiatica*.—The characteristics which distinguish this fine plant are abundance of flowers at nearly all seasons of the year, elegant growth, and easy cultivation. For the decoration of a cool stove, or a warm greenhouse, during nine months of the year, it is scarcely surpassed by anything which even our richest

a glass and placed in a bottom heat of from 75° to 85°. When sufficiently rooted, which will probably be in the course of a month, pot singly in five-inch pots, and place them in a close moist temperature till they have become established. A rather close, warm temperature will be necessary during the summer months, and the plants should be placed near the glass, where the air can be freely admitted on all favourable occasions. During very bright, sunny weather it will be of service to the plants to afford them a thin shade for a few hours about mid-day. If properly attended to, with pot room, etc., they should be handsome plants in ten-inch pots, before winter. A temperature of from 50° to 55° will be sufficiently high from

FIG. 12.—EUCOMIS BICOLOR.

R.H.S. Award of Merit, June 28. Flowers greenish-white with purplish margins and filaments. Shown by Mrs. Carl Holmes.
(see p. 16.)

collections possess. I find that old plants which have bloomed are seldom of much value a second season, and therefore a sufficient stock of young plants should be kept up. These may be propagated at two seasons, spring and midsummer. In selecting cuttings choose short-jointed pieces of young wood, such as exhibit a tendency to produce flowers, as these will form handsomer specimens and bloom earlier than if long-jointed pieces, having no inclination to blossom, are used. The first lot of cuttings should be got in as early in spring as is convenient, say, February, or early in March; they should be planted in a thoroughly drained pot, filled with sandy, peaty soil, covered with

the middle of November till the middle of January, and water must be carefully supplied while the plants are comparatively inactive. Towards the end of January, or as early as the growing temperature of from 60° to 65° can be maintained, shift the plants into their flowering pots. The size of these must be regulated by the taste and convenience of the cultivator. The plant is a vigorous grower and will fill a fifteen-inch pot; or if well supplied with manure water, very fine specimens may be obtained in twelve-inch pots. These will commence flowering early in spring, and will continue to grow and flower for months. *Alpha, Gard. Chron.*, July 10, 1852.

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Lycaste.—Lycaste Skinneri and other members of this useful and interesting genus have made considerable new growth and are in a suitable condition for repotting, which is needed each year. Where many plants of the different species and hybrids are included in a collection the flowering period extends over a considerable period, and the repotting of the different varieties should take place in the same seasons as they produce their flowers, taking care that the young growths are a few inches long and new growths developing from the bases of the plants. Lycastes are, for the most part, vigorous-rooting subjects; therefore, they may receive considerable pot-room, but care must be taken that this is not over done. They delight in a rather retentive compost, but unless the loam is of an open, friable nature, too much should not be used in the compost. A suitable compost consists of equal parts of good fibrous loam and turfy peat, broken up roughly, with all the dusty and earthy particles removed, and sufficient rough sand or crushed brick added to ensure water passing through the compost quickly. Although these Orchids require ample waterings when in full growth, they resent a heavily saturated rooting-material at all times. The plants should be potted rather firmly, keeping the crown a little below the rim of the pot, and the leading growths as near the centre as possible. Grow the plants at this season in a light, airy position in a cool house, as the majority of them require an even temperature the whole year round; at a later date they may be placed in a house where they may receive a little extra warmth. After the roots have grown freely in the new material they may be watered whenever they become dry, but when at rest only sufficient moisture is needed to keep the plants plump and healthy. The distinct and rare *L. Dyeriana* differs from the majority of Lycastes in regard to its culture; having pendulous growths somewhat after the manner of *Cattleya citrina*, this species should be grown in only a small quantity of rooting-material. It grows best suspended near the roof-glass in a house having an intermediate temperature. All Lycastes resent overhead spraying or syringing at any season.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Turnips.—Sowings of Turnips may be made frequently to provide a constant supply of roots throughout the season. The beds should be well watered during hot, dry weather, or the roots will be stringy and tough. Keep the foliage well dusted with old soot, and use the Dutch hoe frequently between the rows.

Onions.—If large Onions are required for exhibition the plants should receive every attention now that the bulbs are swelling. Frequent applications of liquid farmyard manure should be given, and these are best supplied during the evening. When this stimulant is difficult to obtain, guano will be found an excellent substitute. At no time should the ground be allowed to become very dry, or the bulbs will split. Use the Dutch hoe frequently, and if the weather is very dry, apply a mulch of old Mushroom-bed manure along the rows. Keep a sharp watch for mildew, and if detected, either dust the crop with sulphur, or spray the bed with liver of sulphur (sulphide of potassium), on two or three occasions, using the specific at the rate of one ounce to three gallons of water.

Late Potatoes.—If not already done, the late Potato crop should be sprayed with either Burgundy mixture or Bordeaux mixture. This

work should be done thoroughly, taking care that every part of the foliage is wetted with the specific. As spraying is a preventive and not a cure, it should be done when the mixture will act as such, that is before disease has attacked the plants. It will probably be found necessary to spray again once or twice to make sure that the blight is prevented. Late blight disease is more troublesome in some districts than in others, and it is especially prevalent when the summers are wet.

Celery.—Where this vegetable is being grown for very early exhibition purposes, a start should be made to bleach the stems, presuming the plants are growing freely and about fifteen inches high. As this operation takes from six to eight weeks, it should be attended to forthwith. I advise the use of strips of brown paper, about four inches to five inches wide, and these should be wrapped three or four times around the stems, after first removing all side-growth. Tie the paper both at the top and bottom, but not too tightly. In a short time it will be necessary to remove the band and examine the stem to see that slugs or woodlice have not gained an entrance. The paper should then be placed in position again, and another piece added, so as to gradually bleach the stem as growth proceeds; repeat this operation from time to time, until the plant is fully grown, when, if all has gone well, a perfectly bleached stem will be obtained. During the whole of this time the roots should be liberally supplied with moisture, diluted liquid manure from stables and cowsheds being excellent for the purpose. A small ridge of soil about two inches high should be placed at the base of the paper, and if a small quantity of soot is sprinkled on this, it will act as a deterrent to slugs and other harmful pests. The foliage should be sprayed with clear water during the evenings of hot days and kept frequently dusted with old soot during the early mornings while the dew is present on the foliage. This will keep the Celery fly away. A preparation known as anti-fly is also useful for this purpose.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Pot Peaches.—So soon as the trees in the early and successional houses are cleared of their crops, the pruning, cleansing and re-arrangement of the trees will be necessary. Experienced growers will know which shoots to retain for next season's fruiting; all superfluous growths which have borne fruits should be cut away. Remove the trees to a cool, open position out-of-doors, and partially cover or plunge the pots, allowing plenty of room for light and air to enter the branches. If the wood is fairly strong and the foliage robust, it is best to err on the safe side and not use much animal manure, but to apply a thin dressing of loam and light manure. Trees which show signs of weakness from heavy cropping may be assisted to plump up their buds by dusting the soil with soot, bone dust, and a little fresh loam, and then applying diluted liquid manure, which will wash the other materials down to the roots. The trees must be kept clean by copious syringings on fine evenings. Give the roots an abundance of water when moisture is necessary.

Cherries.—Pot and permanently-planted Cherry trees will now be cleared of their fruits, and the former may be placed out-of-doors. The house in which the trained trees are growing should be abundantly ventilated. Early to start and early to rest are the main points to observe in the management of these trees and the retention of the foliage. Red spider is a most troublesome pest to Cherries grown under glass, and whilst syringing could not be done when ripe fruits were hanging, the trees should now be cleared of them by syringing with an insecticide or clear water. Inside borders should be kept well mulched, if only to keep the soil cool, and, as a matter of course, watered freely, also the roots fed if necessary. In very hot weather shade is beneficial, and the whole roof of the house may be covered with netting.

Plums.—As the fruits on many of the early pot trees have been harvested, such trees should be removed out-of-doors and plunged where they can be mulched, watered and syringed with the pot Cherries. Black and green aphides are more troublesome to Plums than red spider, and, if necessary, the house should be well fumigated before any of the trees are removed. When fruitless trees have been removed, rearrange those retained a greater distance apart, as Golden Drop and other choice late varieties need plenty of light and air to cause the fruits to colour and ripen well. These late trees will require a top-dressing of rich materials and feeding copiously with diluted liquid manure. Syringe the trees carefully about the stems, and damp the floors and walls, both early in the morning and late in the evening. The beauty of the Plum is its bloom, and this is soon marred by spotting with water, especially hard water, but where plenty of soft water is available, an occasional wetting will do them no harm, always provided every part of the fruit is wetted thoroughly. An abundance of air, without exposing the fruits to rain, must be given from the time the colouring becomes perceptible, and the size of the fruits may be increased by pinching the points of those shoots, which in due course will be removed, and also by closing the house for a couple of hours on fine afternoons, opening the ventilators later as is considered necessary.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brockett Hall, Hertfordshire.

Stocks.—Where it is desired to have Stocks in flower during the winter, the seeds should be sown forthwith, and again at a later date, to obtain a succession of flowers in the spring. These useful plants may be had in bloom practically all the year round by sowing seeds at intervals during the spring and summer. Some of the best varieties for growing in pots are All the Year Round, Beauty of Nice, Royal Purple and Perpetual. Stock seeds germinate very quickly, therefore it would be unwise to attempt to raise them in heat. There is no more suitable place in which to germinate them than a cold frame, for in cool conditions the seedlings will make short, stocky growth, and there will be far less risk of them damping off. The receptacles should be filled with a light, open compost, which should be shaded from bright sunshine until germination takes place, when the seedlings may be gradually exposed to more light. When they are large enough to handle they should be pricked off singly into small pots or, if desired, three plants may be placed in one receptacle and grown on intact. Stocks are very partial to lime, therefore when the final potting takes place, see that plenty of lime rubble is added to the soil in which they are to be grown.

General Remarks.—Seedlings of Cinerarias, Calceolarias and Primula sinensis will now require attention. Prick them out into boxes or pans. To ensure fine specimens of Cinerarias, the seedlings should be kept growing steadily. A cold frame, under a north wall, will suit them admirably, but this is not always available, therefore, if grown in a house, shade must be provided, for Cinerarias dislike direct sunshine. Calceolarias will need much the same treatment, for these plants also will not thrive in a dry, warm atmosphere. Keep their surroundings moist, and very little trouble will be experienced with green fly, which is a troublesome pest of the greenhouse Calceolaria. Plants of Primula sinensis should also be kept growing steadily under the coolest conditions possible. The compost for this plant may consist of equal parts of good, open loam and leaf-mould, with plenty of sand added to ensure water passing through it quickly. In the plants' later stages, less leaf-mould should be used in the soil; rather substitute a little dry cow manure after passing it through a fine sieve. Seedlings of Humea elegans are ready for pricking off into small pots, which are preferable to boxes, as the plants are very liable to damp off in the latter. Any light, open compost will suit them at this stage, but they must not be grown in a close, hot atmosphere.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Layering Strawberries.—To obtain strong Strawberry plants for fruiting early next season, layers should be prepared so soon as they are ready. In some gardens Strawberry plants are raised and planted in autumn for the express purpose of obtaining strong runners for setting out early in the season and for supplying fruit to follow those from under glass, the maiden plants usually fruiting quite ten or twelve days in advance of the older ones. If the plants have not been allowed to flower and have been watered occasionally during the recent dry weather, there should be numerous layers ready at this date. Prepare sufficient pots in readiness according to the number of runners required. I prefer to use three-inch pots, and these should be filled to within half-an-inch of the rim with sweet, fertile soil prepared specially for the purpose. Press the soil rather firmly. It is not necessary to use drainage material, a little turf at the bottom of the pot being all that is necessary. Select and peg to the soil in the pot healthy runners, choosing one and sometimes two, if of suitable size, from the one stolon. Water them freely in dry weather, more especially as the roots develop. With suitable attention the runners should be fit to plant out in a month's time; they will develop strong, sturdy fruiting crowns by the end of the present season. In the meantime, have the ground thoroughly prepared in readiness for the reception of the young plants. Strawberries grow best in firm soil which has been deeply worked and not too heavily enriched with rank manure. On certain soils a liberal sprinkling of Clay's fertiliser at the roots of each plant in spring will have a beneficial effect, both on the growth and the size of the individual fruits.

Forced Strawberry Plants.—Our best and heaviest-cropped plants are those which have been forced; indeed, the crop from these plants this year is by far the best I have had during the past three seasons. In planting out forced plants in the open first give the roots a thorough soaking with water, after which loosen them and plant firmly. Set the plants at two feet apart and water them frequently in dry weather until the new roots have developed freely. Do not allow the plants to remain in the pots longer than is necessary, the aim being to encourage a free growth and build up strong crowns by the end of the season. Any flowers that appear may be pulled off and runners removed. Keep the land free from weeds by hoeing it occasionally.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Rhododendrons and Azaleas.—As these shrubs pass out of flower the old flower heads should be picked off, for the formation of seeds is very exhausting to the plants. A mulching of decayed leaves should be placed over the roots, but put on thinly, for a heavy mulch would exclude the air, and if applied too deeply around the stems the plants may be killed. It is not generally realised that this and deep planting are the direct causes of ill-health and the ultimate death of many Rhododendrons.

Cytisus and Genistas.—These genera include some of the freest-flowering of shrubs. Neglected plants are apt to get bare and leggy, and to prevent this the shoots should be partially shortened when the plants have finished flowering. This need not necessarily be done every year; the grower should, to a certain extent, be guided by the amount of growth made, and the size he wishes the plants to attain. Most of the species may be raised from seeds; the hybrids and varieties must, however, be increased by means of cuttings or grafting. Cuttings are best made from half-ripened wood, and they may be dibbled into sandy soil, under a bell-glass, either in the open or in cold frames. Grafted plants may be worked on seedlings of the common Laburnum.

Rambling Roses.—These plants should be pruned so soon as possible after they have finished flowering to allow the young growths plenty of time and space to develop, as strong, well-ripened shoots are essential to free-flowering. Where plenty of new shoots are developing, all the old ones may be cut out. It may however, in many cases be necessary to retain a portion of the old shoots for furnishing the space. In making a selection of varieties for furnishing pillars and pergolas, preference should be given to the many beautiful Wichuraiana varieties, as their hard, glossy foliage renders them less subject to attack from green-fly and mildew. On the other hand many varieties in the multiflora section are subject to attacks of mildew and red spider. Tall standards of this type should be pruned in much the same manner as the others.

Sorting and Cleaning Bulbs.—Where large quantities of bulbs are used for spring bedding they should be cleaned and sorted, so that orders for any additional ones required may be sent to the bulb merchant at an early date. All bulbs should be kept in a suitable building, in cool and airy conditions. They should never be left exposed to hot sunshine; although one frequently reads that exposure to sun is the

make good plants for placing outside during the autumn. Aubrietias may also be increased from single cuttings; large plants may be lifted, divided and small, partly-rooted pieces transferred to the shaded frame for a time, when they will soon make useful tufts for planting out. Pyrethrums of the herbaceous section which have finished flowering may be increased by cutting over the spent flower-stalks, leaving them about six or eight inches high, and then twisting or jerking them out of the clump singly, when it will be found that numerous dormant or partially developed buds are situated near the base. These spent flower-stems if inserted in a sandy compost, will soon develop roots and useful plants are soon produced in this way.

Seedlings.—The raising of plants from seeds is one of the most fascinating of garden occupations, and where seeds of hardy Primulas, shrubs, etc., were sown earlier, the seedlings should now be ready for planting out in nursery rows, or transferring singly to small pots, according to the class of plant dealt with, as some do not transplant freely unless from pots, while others, such as the hardy Primulas referred to, may be lifted as desired and moved to their permanent quarters without injury.

FIG. 13.—CYTISUS LORD LAMBOURNE.
(see p. 29).

correct way to dry them off. In the case of Tulips, at least a few hours' exposure to hot sunshine is certainly fatal, for the exposed side is quickly scalded. Where large quantities of Tulips are grown, disease is an ever present menace; therefore, a keen watch should be kept for any signs of disease during the growing season, and when lifting and sorting them all but sound specimens should be destroyed.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Propagating Alpines, etc.—The present month is very suitable for the propagating of many varieties of spring-flowering plants. A shaded frame should be made ready for their reception, preferably one with a north aspect, as in such a position the rays of the sun will not fall direct on the newly-inserted cuttings. All Saxifragas are readily increased at this season, and in the case of the finer varieties, which do not increase rapidly, the cuttings or side-shoots may be inserted singly in small pots, and the latter plunged to the rims in ashes or other moisture-holding material. Cuttings or pipings of the members of the Dianthus family also root freely and if rooted now, they will

Plants which are difficult to transplant, unless in pots, include Cordylines, Eucalyptus and Buddleias. Many varieties of shrubs may be easily raised from seeds, sown so soon as they are ripe; others may be kept for a year in sand before sowing them. Plants raised from seeds seem to possess more vigour and robustness than those raised from cuttings.

Sweet Peas.—Spring-sown plants are flowering, and care should be exercised in removing spent blooms, and supplying the rapidly-growing plants with moisture. In dry districts a mulch of strawy manure will be of great benefit, after giving the rows a thorough soaking with water. Should further support be required, this should be given the plants in good time, either in the form of additional stakes, or by placing tall posts and wide-meshed wire-netting along both sides of the rows. Where Sweet Peas are grown on the single-stem system, Bamboo canes, eight feet or nine feet long, placed to each plant and fastened securely to a wire at the top, strained between two stout posts at either end of the row, make a neat and strong support, but much time must be devoted to these plants in removing side-shoots, tendrils and premature flowers, as well as in keeping the growths upright by tying them to the stakes.

NOTES ON MECONOPSIS.

JUNE is the month for this genus, though flowering may begin so early as May and be prolonged into July. With each succeeding year the Himalayan Poppies attract more attention, especially in Ireland and Scotland, where they do particularly well; so much so that recently Mrs. Walter Jones staged a first-rate exhibit of *Meconopsis* species only at the R.H.S. show, when *M. grandis* received an Award of Merit.

Quite a number of species are now generally cultivated, and *M. integrifolia*, *M. pseudo-integrifolia*, *M. quintuplinervia*, *M. Prattii*, *M. Baileyi*, *M. simplicifolia*, *M. paniculata* and *M. Wallichii* are established favourites. Even *M. grandis*, a somewhat over-rated plant, in the south at least, is becoming commoner, while *M. robusta*, *M. aculeata*, *M. chelidoniifolia* and a few others are seen about.

Twice have I been shown what was alleged to be *M. brevistyla* growing profusely, only to find that it was really *M. integrifolia*. It does not seem to be realised that *M. brevistyla*, if in cultivation at all, is very rare, and not a success; nor is it any improvement on its understudy. Nurserymen, who ought to know better by now, still offer *M. paniculata*, or *M. robusta*, under the name of *M. 'nepalensis'* (or some variant thereof); failing that, they use '*robusta*' as a synonym for '*paniculata*'.

There is a difficulty about the name '*napaulensis*.' It is as certain as anything can be in so inexact a science as botany that *M. napaulensis*, if it is not *M. robusta*, is identical with *M. Wallichii* var. *fusco-purpurea*, and by all the canons of precedence, *Wallichii*, whether blue, vinous or cream, should be dropped in favour of the earlier *napaulensis*, the vinous coloured form of which first received the name. But no multiplication of Geneva conventions can banish an established name like *M. Wallichii* from our gardens, even in the interests of historical accuracy. It may even be doubted whether nursery catalogues can be permanently cured of calling the yellow-flowered *M. paniculata* (or *M. robusta*), *M. 'nepalensis'*. But though I shall not aid and abet horticulture in this latter heresy, it is merely pretentious to write of *M. napaulensis* when one means *M. Wallichii*; though I have only met with one catalogue which flouted custom in this way, and even then the effect of esoteric knowledge was marred by the inclusion of *M. Wallichii* as well! If *M. napaulensis* was really *M. Wallichii*, what was *M. Wallichii*?

While on the subject of names, one might refer to the persistence, amounting almost to perversity, with which the Edinburgh school speaks of *M. betonicifolia* when they mean *M. Baileyi*. Here again, I am afraid they will find the latter name too firmly embedded for painless extraction without gas—even if the operation is strictly legal. I have already pointed out the difference between the two species (*Annals of Botany*, July, 1926, and *Gard. Chron.*, June 26, 1926), and if ever *M. betonicifolia* can be persuaded to flower—I understand there are seedlings—it will be possible not only to confirm this, but perhaps also to find new grounds for divorce. So far, the opponents of *M. Baileyi* have relied on reiterated assertion to tempt the uninstructed from their allegiance, but evidence, so far not forthcoming, would be more effective.

By the way, may one be permitted to ask why the true *M. betonicifolia* has not been in our gardens for the last two decades? It was one of Delavay's finds, described by Franchet nearly forty years ago, and ought to have been rediscovered and introduced by a generation of collectors in Yunnan—though I must confess I never came across it there myself. Dare one suggest that the real answer is, it *has* been in cultivation, but proved a miserable failure, like *M. Delavayi*, *M. lancifolia*, *M. impedita*, *M. Henrici* and other species? This surmise, if it aims aright, bodes ill for the identity of *M. betonicifolia* with the easily grown *M. Baileyi*. If not, what a pity so much energy was spent in introducing the above-named pariahs, while time and again the peerless *M. betonicifolia* was overlooked!

Under cultivation, *M. Baileyi* is showing

variation in two directions. Apart from a slight instability of colour, common to all blue-flowered species, I find (1) an increase in the number of petals, and (2) an increase in the number of flowers. As regards the first, in Tibet I saw scores of plants, and no flower ever had other than four petals. Here the number is almost always six to eight. As regards (2), in Tibet, it was the exception to find a plant with more than about six flowers, arranged in a loose, terminal cyme. Here a dozen or more usually develop, and it is not uncommon to find the leaves all up the stem bearing axillary flowers. (Compare the photograph of the wild plant in *The Gardeners' Chronicle* for May 8, 1926, with that of the same species growing at Wisley, published on June 25, 1927.)

The flower of *M. Baileyi* is interesting from the fact that it is one of the few species—*M. latifolia* is another—in which filaments and petals do not match in colour; the filaments of *M. Baileyi* are colourless, those of *M. latifolia* purple. There is a charming creamy-white form of *M. Wallichii*, sprung from seed of the bluest, sometimes met with in gardens. It flowers earlier than the blue, and has a purple instead of a cream stigma, otherwise it resembles the normal form. I have heard that *M. simplicifolia* also throws this cream variety, which confirms my experience in Tibet; I have no hesitation in saying that the '*Ivory Poppy*' collected there (K.W. 5,766) is nothing but a cream-coloured *simplicifolia*.

There is really no excuse for confusing *M. Wallichii* and *M. paniculata*, even out of flower. The former is a dark green plant suffused with golden hairs, the latter is much paler; also the leaves of *M. Wallichii* are almost pinnatisect, those of *M. paniculata* are only lobed. If even then confusion can arise, there is one test which I have never known to fail. All the Poppy family contain poisonous juices, but in these two species there is a copious latex, gamboge-yellow in *M. paniculata*, sulphur-yellow in *M. Wallichii*.

A word of advice to collectors, who rarely give adequate descriptions of plants, and in this instance almost always omit crucial information regarding the colours of anthers, filaments and stigma. It is important to record these in the field, because it is practically impossible to ascertain them from dried specimens. F. K. W.

BULB GARDEN.

LEUCOJUM AESTIVUM.

OWING to its vigorous growth and freedom of flowering, this Snowflake was a most conspicuous plant on the banks of the lake here in spring. During the winter the roots of these *Leucojums* are under water. On April 23, when the plants had flowers on stalks two feet in length, the roots of the strongest bulbs were several inches below the surface of the water. The foliage is equally strong and very dark green.

The soil here is a sandy loam, and the situation in which the plants are growing sheltered and partially shaded.

Although seldom seen as a water-side plant, this Snowflake may be thoroughly recommended for planting in such a situation where the soil is light and sandy.

Often described as a May-flowering plant, many of the elegant, drooping, white flowers were fully open on Easter Sunday, April 17, and were most useful for cutting.

Bulbs may be planted from the end of September until the middle of November.

COMMELINA COELESTIS.

THIS is a very attractive plant, with glossy foliage and rich blue flowers. Often described as hardy, the tuberous roots are impatient of stagnant soil, and unless grown in warm, well-drained soils, are liable to perish during the winter.

On a naturally-drained gravel soil in a Berkshire garden, this *Commelina* proved to be quite hardy, and produced an abundance of fertile seeds, colonies of seedlings springing up around the parent plants each season.

Plants raised from seeds sown under glass

in the spring may be planted out in May or June and will flower during the summer. There is a white variety, but it is not often seen in gardens.

Commelina coelestis grows to a height of eighteen inches. C. Ruse, *Tingrith Manor, Bletchley*.

ALPINE GARDEN.

SPRAGUEA UMBELLATA.

A PLANT of *Spraguea umbellata* was given me by Mr. John Grandfield, of Acton, who had been travelling in California and particularly on the Sierra Mountains of Nevada at considerable elevations.

Spraguea umbellata is recorded as having been introduced to this country from New Mexico in 1859, and was described as a hardy plant for the rockery. It is closely related to *Claytonia*, and differs from it chiefly in having two large, roundly-heart-shaped, membranous, white sepals. The flowers are white and purple, borne in dense clusters, and are about the size of Peas. The plant I have consists of twenty stems, three to four inches long, radiating from a single crown, and each stem is terminated by an umbel of these singular looking flowers. The radical leaves are spatulate and fleshy, while the stem leaves are very small. The whole of this was supported by one long tap-root with few fibres. The plant is very prolific and plentiful where it occurs, and evidently well-adapted for resisting drought. J. F.

ASTER SUBCAERULEUS.

IT is long since I received from the late Max Leichtlin, the plant correctly known as *Aster subcaeruleus*, which figures in gardens and nurseries very frequently under the name of *A. diplostephioides*, a different *Starwort* altogether. Max Leichtlin was also responsible for a fine variety, which he called *A. diplostephioides Leichtlinii*.

The true *A. diplostephioides* is rare in cultivation, but is not difficult to distinguish from *A. subcaeruleus*. The most marked feature, which will enable identification lies in the fact that the true *A. diplostephioides* has a purple disc, while that of *A. subcaeruleus* is yellow. After a lapse of some years owing to my first plant being lost in removal, I have again become the possessor of a plant sent me as *A. diplostephioides*, but which proves to be *A. subcaeruleus*. I do not regret this much, as it is a very charming *Aster* of low stature, suitable for the border or the rock garden. It grows freely and soon makes a good clump of deep green, oval leaves, from which, to a height of about twelve or fifteen inches, arise stems bearing large, lovely flowers, like those of the purple *Aster alpinus*, with a bright golden disc. The first blooms opened here before the end of June, and the plant will continue in bloom for a good while, adding much attraction to the place in which it is planted. S. Arnott.

CULTURAL MEMORANDA.

PROPAGATING ROCK GARDEN PLANTS.

FROM now onwards is a suitable time to propagate rock garden plants by means of cuttings, which are best rooted in pots or pans in sandy soil. Most of them will root readily in cold frames, plunging the pots in ashes or sand, while any difficult subjects should be rooted under bell-glasses.

The cuttings should be made with a very sharp knife. A sand-bed made up to within ten inches of the glass in a cold frame facing south is an ideal place for them. Tiffany should be stretched over the glass as a protection against very hot sun, a much more satisfactory method to adopt than white-washing the glass.

Damp the cuttings lightly several times daily in hot weather, and admit air for an hour only in the mornings until root action commences.

Saxifrages and many of the coarser-growing, creeping plants may receive rougher treatment; fairly large pieces, without roots, planted in sixty-sized pots will make good specimens in a week or two, if kept close in a frame. S. Bowler.

FLOWER GARDEN.

NEPETA MUSSINII.

THIS beautiful Cat-mint is useful for edging beds and borders on a large scale and should be more generally used for the purpose. Although this plant is easily increased by means of division, it is also readily propagated from cuttings, which may be inserted at this time, dibbling them into a bed in a cold frame. By this method a large stock may be raised quickly and the plants will be ready for planting out during the autumn. J.

THE PENTSTEMON.

It might be difficult to get a wholly satisfactory answer to the question: "When was the work of improving the Pentstemon commenced?" But there can be little doubt that such species as *P. Hartwegii*, *P. Cobaea* and *P. gentianoides* were the forerunners of the fine trumpet-like, brilliantly-coloured types now common in gardens. Scotland is the recognised home of this useful hardy border plant, and it is quite probable that many of the earlier improvements resulted from the work of Scottish florists. French raisers also introduced many of the earlier improved varieties, and subsequent improvements have produced a race of plants with high decorative qualities.

Pentstemons are very easily cultivated, and few other hardy plants yield such an abundance of blossom during the summer. Owing to their compact, sturdy habit and the brilliant colouring of their flowers, they are alike valuable for planting in beds, in ribbon borders, and as bold groups in colour scheme borders, while they are also useful for furnishing cut blooms.

Although not exacting as regards soil, a rich, friable loam suits them best, and soil of a light, sandy nature should be well prepared for them before planting. During periods of dry weather occasional waterings will be necessary, and a mulching of short manure is very helpful in maintaining vigorous growth. Under good cultivation the plants continue to produce their handsome, pyramidal spikes of flowers from July to October.

Pentstemons are easily raised from seeds, and those saved from a good strain may be expected to produce a large percentage of good varieties. Propagation from cuttings is equally easy, and is naturally the method employed for increasing named varieties. The cuttings made from shoots which spring up around the base of the flowering stems or from the lateral growths of the flower-spike, should be inserted in August and September. The softer wood roots more readily than that which is too hardened, leafy shoots, about four inches long, making the best cuttings. They should be inserted firmly in sandy soil, in boxes or pans, and placed in a cold frame, or if large quantities are needed, they may be dibbled into cold frames. A. P. C.

IRIS GARDEN.

IRIS ZAHAROON.

THIS beautiful Iris (Fig. 14), was exhibited by Mrs. W. R. Dykes at the Iris Society's exhibition on June 2. It is a variety of outstanding colour, buff overlaid with carmine, and it has a beautiful golden crest. Iris Zaharoon is a large, shapely flower perhaps a trifle "thin," but its unusual colouring appealed to all who saw it.

SOME OUTSTANDING VARIETIES.

THE number of varieties and hybrids displayed at the show of the Iris Society, on June 2, offered a splendid opportunity to compare the merits of the individual sorts, and a few notes on outstanding varieties may be of interest to those who intend to plant Irises this season.

The following sorts are amongst the best in cultivation:—Ambassadeur is a large and noble flower; the standards are reddish-violet, the falls of a rich velvety violet.

The flowers are produced on a well-branched spike. Abenda has a free-branching habit, bearing, on tall, stout stems, flowers of good shape. The standards are prettily incurved and are coloured old rose, shot with bronze; the falls are a rich velvety madder-crimson, with a bronze haft. Athens is a good white flower of fine substance and form; perhaps the finest of the whites is Mrs. Robert Emmet; the large, milk-white flowers are of good substance, and borne on stout spikes in the greatest profusion; they are set off by a conspicuous yellow beard. Many of the spikes bear from seven to thirteen flowers. Amber is a most striking self-yellow variety and has a well-branched spike.

Belladonna is a pleasing shade of China blue; the flowers are developed on well-branched stems and are agreeably scented. Bruno is a conspicuous and noble Iris of exceptional merit.

Lord Lambourne is a showy garden variety. The plant has tall, well-branched flower-spikes, bearing flowers with rosy-fawn standards overlaid with bronze; the falls are rich madder-crimson, reticulated with white at the haft, and the flower has a golden-yellow beard. Marjorie Tinley is a gigantic pallida form, bearing large, well-formed flowers of remarkable substance on well-branched stems, and very free. The standards are broad and prettily incurved, of a soft lavender shade; the falls are deep mauve. Lady Sackville is a charming variety and exceptionally free-flowering; the large, well-formed flowers are borne on stout spikes; the standards are a beautiful silvery blue and prettily incurved. The falls are rich violet-purple with a conspicuous orange beard. Mrs. H. F. Bowles is a very effective variety with a colour almost impossible to describe.

FIG. 14.—IRIS ZAHAROON.

The standards are bronze, tinted lavender, and peculiarly shaded yellow at the base; the falls are velvety reddish-purple. Crimson Glow is of an attractive and uniform shade of crimson-rose with prettily frilled standards; the spikes are well-branched and very free flowering. Ballerine is a delicately scented variety of pallida form. The plant has a well-branched habit; the standards are light bluish-violet, broad and prettily waved, the falls of a deeper shade. Benrimo is a large flower of good form; the standards are bright blue and incurved, the falls a light purple. The general contour of the flowers of Feronia is all that could be desired; the plant develops large, stout spikes, bearing well-formed flowers of a soft rose; the falls are old rose, prettily reticulated with crimson. The variety George Yeld, named in honour of the veteran and distinguished raiser of Irises, is one of the most showy of all Irises. The standards are bright apricot shaded with rose, the falls a brilliant wine-red edged with buff.

The standards are soft brown overlaid with gold; the falls brick red with a glistening sheen, and with a conspicuous white-lined base. It is a most profuse bloomer.

Mrs. Marion Cran is a tall, well-balanced plant, bearing flowers of great substance. The blooms are a delightful shade of light silky rose. Lent A. Williamson is a vigorous grower; the standards are bright blue, the falls velvety purple suffused with blue at the edges. Mary Gibson is one of the most showy and distinct Irises in cultivation; the standards are a delicate shade of pale bronze, overlaid with rose; the falls are old rose suffused with bronze and the flower has a conspicuous yellow haft and orange beard. Mr. Edward Harding is one of the most effective of Irises, having handsome flowers with violet-purple standards and black and violet falls.

Other good sorts noted were Rosalba, Quaker Lady, Opera, Damozet, Shekinah, Azure, Olympus, Oliver Murrell, Swazi and Dimity. W. Logan.

THE PANCIATICI OR FLORENTINE BIZZARRIA ORANGE.

I WAS lately reading again the description of this plant written in 1674 by the physician Pietro Nati, Professor of Pharmacology in the University of Pisa, when two writings on the same subject came in my hands; the first, published in this paper, April 9, 1927, p. 241, as a report of an article by the Japanese Professor Tyôzaburô Tanaka; the other written by Mr. Charles F. Swingle, in the *Journal of Heredity*, of Washington. Both these articles conclude rightly that this plant is a graft-hybrid or chimera; but they do not carry any light on its origin, which appears still wrapt in mystery.

For many years I have had the opportunity of studying this plant, two specimens of which are grown *ab antiquo* in the neighbouring Royal garden of Castello.

It may be concluded that in the three last centuries the cultivation of the Agrumi (Lemons, Oranges and Citrons of Florence) was common in the Florentine region. No villa or town garden was lacking an *espalier* or *boschetto* (little wood) of these plants, for which, however, a protection with straw mats or other material was necessary during winter.

The Citron of Florence, *Citrus Medica*, was preferred as the noblest of all. It was common practice to graft it on *Citrus Aurantium amara* stock, the Sour Orange, because it is the hardiest and most vigorous of all the Citrus; *quippe cacteris congeneribus vegetiores*, writes Professor Nati.

The villa Panciatici, della Torre degli Agli, situated near the gates of Florence, had its *boschetti* of Citrons, and Giuseppe Piccioli, gardener to the Grand Duke of Tuscany, in a little book entitled *La Coltura dei fiori, etc.*, (Firenze, C. Pagani ed. 1797, p. 31) describes the production of the Bizzarrìa. It is to be noted that Piccioli had been gardener of the Marquis Panciatici, and was the author of the *Hortus Panciaticus*, therefore he was in a position to know the facts.

Piccioli writes that a plant of Citron, grown in a little wood, for an unknown cause, died. Later, a shoot was produced on the stock, at the foot of the plant (*ripullulò al piede sopra il Selvatico*); the shoot was not grafted, and when it flowered and fruited, showed mixed characters of the Citron and Sour Orange. This is evidently the origin of a graft-hybrid by natural decapitation.

If we do not accept this origin, we must admit that by chance, indeed very strange, the stock on which the Citron had been grafted, was a sexual hybrid Sour Orange \times Citron. The possibility of such a cross, suggested originally by Strasburger, has been disproved by experiments; nobody has been able to produce this hybrid, and I myself have made formerly some vain attempts to do so.

It is certain, however, that no special artifice of graft or of any other kind intervened in the production of this plant, as has erroneously been stated, even recently. Professor Nati writes in his pamphlet that the gardener of Villa Panciatici assured his master that the Bizzarrìa had been produced *nulla malorum adoptione, nulla sactionis artificio nulloque adulterii ingenio, sed solo eventu genioque naturae*.

Professor Nati's pamphlet entitled: *Phytologica observatio de Malo Limonia Citrata aurantia Florentiae vulgo La Bizzarrìa—Florentiae, 1674*, is very rare. It is remarkable for its scientific exactness for its times. All the varieties, as may be observed from the branches, leaves, flowers and fruits of this plant are described with accuracy, and modern writers may find very little to add to this subject.

But even more interesting is the suggestion of the possibility that some influence may have passed from the scion to the stock. He writes at p. 16: "*In hoc multiplici et longa annorum serie iterato arborum conjugio contingere aliquando potuisse ut ex confinio ocularis insitionis, in quo temporis dinturnitati parmixta utriusque arboris natura concreverat, quam varii per com-*

munes fibrarum ductus permeantes humores diu aluerunt, unum aliquando germen utramque malorum speciem probe reservans, emergerit."

Piccioli's little book is even more rare. Various subjects are therein treated, and the origin of the Bizzarrìa incidentally. I possess a copy of the fourth edition printed at Florence by Anton Guiseppe Pagani, ed. C., edit. 1797. *Dr. A. Ragionieri, Castello, Florence.*

A REVISION OF VIOLAS.

(Continued from page 414, Vol. LXXXI.)

V. ELEGANS is the name given by Kirschleger, who wrote the *Flora d'Alsace*, to a *Viola* which he found there, and which is now known as *V. lutea* subspecies *elegans*, in contradistinction to *V. lutea* subspecies *sudetica*. The latter is the Eastern form of this widespread European *Viola*; the former is the form which is the better-known, and a native of England (as in Teesdale), Scotland and Ireland, France, Belgium, the Rhine Province, Switzerland and Alsace. It is, in short, the Western European form, and is distinguished from the other by its more slender and graceful stems, by the palmate rather than pinnate division of the stipules, and by the much longer spur. The Eastern form also is almost invariably yellow, whereas *V. elegans* is yellow or violet or these colours mixed. The French form is deep violet. Mr. Lofthouse, who is an enthusiastic admirer of *V. lutea* from Teesdale, sent me a violet-coloured specimen which I took to be the French form, but which came to me as var. *amoena*. It is tempting to think that this was the *V. amoena* with which, along with *V. stricta*, the late Mr. James Grieve crossed *V. lutea* from the Pentland Hills, and with the Pansies of 1863, to produce the modern garden *Viola*. But *V. stricta* has never been traced; and *V. amoena* is almost equally mysterious. Many gardeners have proclaimed the merits of *V. lutea* sbsp. *elegans*.

V. elongata.—Under *V. calcarata*, I wrote that I had so far been unable to trace this name. I am now able to state that it is *V. elongata* Huet de Pavillon, and a synonym of *V. heterophylla* sbsp. *messanensis*, a species from the hills near Messina in Sicily, which is distinct from both *V. calcarata* and *V. Eugeniae*. It is grown in this country under the name of *V. pseudo-gracilis*—a name which must be abandoned, as there are two distinct *Violas* called *pseudo-gracilis* (one of Strobil and one of Huter, Porta and Rigo), and it is the other *pseudogracilis* which has the prior right to the name. *V. heterophylla* sbsp. *messanensis* is a pretty *Viola*, rather reddish-violet in tone, with slightly incurving petals, which is worth growing and may be obtained from nurseries. There is, however, a much finer form, called *imperatrix*, which awaits introduction from the "toe" of Italy.

V. Eugeniae, Parlatores, is distinct from both *V. elongata* (see above) and *V. calcarata*. It belongs to the Altaica section, the most easily recognised differences between this and the *Calcaratae* being the longly-petioled lower leaves, the broader, upper leaves, and the generally short spur of the former, as compared with the shortly-petioled lower leaves, the narrower upper leaves and the very long spur of the latter. *V. Eugeniae* is a dwarf, almost stemless, plant, with yellow or violet flowers and an extremely short spur and round, ovate leaves. It comes from high places (as high as 9,400 feet) in the Central Apennines, especially in the Abruzzi, and on the Gran Sasso d'Italia.

V. Falconeri, Hooker f., is now related to *V. Jordani* as a variety of that species, which is well-known on the Riviera, and occurs spasmodically also in eastern Europe. The variety was found near Srinagar, in Kashmir, at about 10,000 feet.

V. glabella, Nuttall, is not a big, but a relatively small, yellow *Viola*, and is not recorded from Colorado, but is a north-east Asian and Alaskan species. It is in fact the

connecting link between *V. uniflora* of Siberia on the one hand, and *V. pubescens* of the middle and eastern United States. It inhabits the Kurile Islands (more famous for Azaleas), and Kamtchatka, and thence crosses the Bering Sea to Alaska, whence it descends into British Columbia and along the Californian coast as well as the Sierra Nevada. In general appearance it suggests *V. biflora* of the European Alps, but botanically is quite distinct. Until recently, it was offered by at least one Scotch nursery, but now seems difficult to procure. I obtained it recently from California under the name of *V. cordata*.

V. gracilis, S. and S.—For an account of this perplexing species, see *Gard. Chron.*, September 18, 1926. There is apparently no means of killing the deeply-rooted tradition that this is the Sweet Violet of Greece—a myth repeated only this year by one of our most erudite gardeners. It is a plant of Asia Minor, which is occasionally found in Macedonia. The type is in danger of being lost among the never-ceasing numbers of hybrids, many of which are indistinguishable one from another, and some of which, like the most recent of all, *V. Therkildienii* or *V. g. Huntercombe Purple*, are nearly inseparable from garden *Violas*. But they are all beautiful—none, perhaps, more so than Mrs. Bowles, a hybrid of *V. gracilis* and *V. Munbyana*, several supremely beautiful patches of which may be seen at Wisley.

V. gracillima, Chaten, is the French form of *V. lutea* sbsp. *elegans*. It is violet rather than purple, and a most beautiful form, suggesting a transition to *V. Bubanii* of the Pyrenees.

V. grandiflora Griseb., is not *V. Clementiana*, but is synonymous with *V. Zoisii*.

V. hastata, Michaux, belongs to the same group as *V. pubescens* and *V. glabella*. It is the halberd or spear-leaved *Viola*, with arrow-shaped leaves, from hill forests of the Eastern U.S.A. The flowers are deep golden yellow.

V. hederacea, Babill., is a very beautiful, almost stemless *Viola*, small-leaved and rosette-forming, which was classed by Sweet under a distinct genus as *Erpetion*. The flowers are rather small but numerous, generally violet, more rarely white. It is frequent here and there in New South Wales, but is widespread over Victoria and in Tasmania, where it grows in moist, sandy places. I have had it from a French nursery, but whether it proves hardy remains to be discovered.

V. hirta, L., belongs to a group which is chiefly distinguished from the Sweet Violets by the absence of scent and the absence of runners. The leaves of *V. hirta* are not so elongate as Farrer states, the vernal leaves being just longer than broad, and the summer leaves being oblong-ovate. Neither are they invariably hairy, as there is a form in which the lamina of the adult leaves is entirely hairless. It is impossible to say whether by *V. sciaphila* Farrer intended *V. ambigua* W. and K., or *V. pyrenaica*, Ramond. Both are fragrant (unlike *V. hirta*), but the flowers of the former are rose-violet, paler at the throat, and of the latter lilac, or sometimes dark violet. The group, as a whole, comprises *V. hirta*, widespread over Europe; *V. collina*, Besser, pale violet, white at the base with hairy whitish leaves, from eastern Europe mainly; *V. hon-doensis*, which is the representative of *V. collina* in Japan; *V. ambigua*, W. and K., from Eastern Europe, Armenia and Siberia; *V. Thomasiana* Perr. and Song., the representative of *V. ambigua* in the Alps, with pale rose and very fragrant flowers; and finally *V. pyrenaica*, Ramond, a sporadic form which occurs here and there from the Pyrenees to Savoy, Switzerland, the Tyrol, Salzburg, Carinthia, Bulgaria and Greece, and the Caucasus. The differences between these species are, with the exception of the alpine *V. Thomasiana*, more botanical than of garden value, and the gardener will regard them all indiscriminately as varying in colour and pubescence only, while remaining in a distinct class from *V. odorata*. *E. Enever Todd, Lt.-Col.*

(To be continued)

ROSE GARDEN.

STIMULATING GROWTH.

ROSES in a stunted condition require a little patience and perseverance on the part of the grower before their condition can be improved. Diluted liquid manure applied to the roots on frequent occasions is as suitable as anything.

A mistake often made in growing Roses is watering them excessively. If the soil is hard and dry, give the plants a good soaking, and then apply the liquid manure, but do not water again for several days.

Some interesting facts concerning the feeding of Roses were issued a short time ago by the U.S.A. Bureau of Plant Industry:—After various experiments with certain manures it was considered that farmyard manures were the most effective, and are valuable when composted or mixed with soil or when in a well-rotted state as a mulch for growing crops. Rapidly fermenting manure will injure the roots of almost any plant. Liquid manures should therefore be made from materials that have already fermented or rotted under such conditions as to conserve their fertilising value. The following proportions will make good solutions: 10 lbs. of pulverised sheep manure to fifty gallons of water; or 20 lbs. of cow or horse manure, when in a comparatively dry condition, to fifty gallons of water; or 3 lbs. to 5 lbs. of poultry manure to fifty gallons of water. The manure should be placed in a coarse gunny sack and soaked in water for several days, sousing the sack up and down occasionally and mashing it with a blunt stick, so as to thoroughly break up the contents.

Strong-growing Roses with good root-systems will be benefited by feeding them with such liquid manure once in ten days or two weeks during the period of most active growth. When growth is slow or checked by cold or cloudy weather, feeding should be discontinued until active growth again indicates its need. The frequent use of the hoe will do much in promoting vigorous growth.

There is much greater danger of over-feeding than under-feeding. If there are indications of over-feeding, sow on the beds some quick-growing plant that will appropriate some of the excess of plant food; also give the soil a liberal coating of gypsum, which will counteract an excess of soluble salts. When the weather is favourable an excess of soluble material in the soil may be reduced by thoroughly drenching it with water.

DISBUDDING.

To have good Roses, disbudding must be resorted to. One fine bloom on each shoot is more satisfactory than a number of small ones which, if left to grow, tend to weaken the plant. The central bud is always the best, therefore remove all side buds so soon as they are seen. If the blooms are not cut, the old flowers should be removed so soon as they are over, shortening them to the first strong shoot or bud. This will generally be about two or three leaves below the bloom. Suckers of Briar or Manetti stocks should not be allowed to develop, for if they are not removed entirely they will soon kill the plant. G. B.

TREES AND SHRUBS.

ERICA TETRALIX MOLLIS.

ERICA Tetralix, the cross-leaved Heath, is found wild all over Britain and is very common in the west. There are several varieties, and at the meeting of the Royal Horticultural Society on June 8, Messrs. D. Stewart and Son showed the beautiful form, illustrated in Fig. 15, named mollis, the varietal name being derived from the soft, downy character of the leaves, which gives the plant a frosted appearance. The specimen shown was covered with the little white bells, and had every appearance

of making a good garden plant. The Floral Committee granted the variety an Award of Merit.

CYTISUS LORD LAMBOURNE.

THE genus Cytisus includes many excellent garden plants which are not only very floriferous, but have a graceful habit, and are useful alike in the shrub border and the flower garden. The fine hybrid illustrated in Fig. 13 was shown by Messrs. Watson and Sons, Ltd., at the Chelsea Show on May 25, and received the R.H.S. Award of Merit. It is a variety of the Dallimorei type with primrose coloured standards and keel, and pretty, crimson wings. It is a notable addition to the new race of hybrid Cytisuses.

JASMINUM REVOLUTUM.

THIS, most robust-growing of all the Jasmines, is a comparatively rare garden plant. Unlike the common Jasmine, which is so deservedly

masses of bright colouring are desired during the summer and autumn, the Golden Elders have much to recommend them, and a maximum of effect may be obtained with a minimum of labour.

The Golden Elder also makes a fine subject for planting in street boulevards and road shrub borders, and is planted to good effect in some of the streets in this way at Southend-on-Sea.

There are several good golden-leaved varieties of Elder in general cultivation, the best two are Sambucus racemosa plumosa aurea, a variety of the red-berried Elder, and S. nigra foliis aureis, a golden variety of our native species. Both have very showy foliage, which becomes most intense in colour during the "dog days." When autumn sets in, these Golden Elders often lose colour effect through the later-formed leaves being larger and paler than those produced during the height of the summer. This loss of colour value may be prevented if the growing points are pinched out during the late summer.

FIG. 15.—ERICA TETRALIX MOLLIS.

popular, this is not a twining species, but of spreading, rambling habit. It is an admirable wall shrub, and will thrive wonderfully well even in poor soil. An established specimen will produce quite large clusters of fragrant, bright yellow flowers from midsummer until long after autumn has set in. The foliage of this species, which in former days seems to have been known as the Italian Jasmine, though it is a native of Afghanistan and the North-west Himalayas, varies in an interesting manner. The leaves are mostly alternate. The earliest-formed are often entire, and the later ones have from two to six secondary leaflets and on occasion even more. These side leaflets have very short stalks, while the terminal leaflet, which is always larger than the others, has a definite stalk. This most desirable yellow Jasmine continues to grow until late in the year, with the inevitable result that the late, sappy growth is generally killed by frost, but as the flowers are produced on the current year's growth, this loss is of no moment.

THE GOLDEN ELDERS.

To the forester, our native Elder is, rightly, a woodland weed, but in the wild garden a well-placed standard may well be a thing of beauty, and especially so when growing by the side of a stream. In such places where bold

Golden Elders so treated will usually retain their foliage longer than those untreated.

POLYGONUM BALDSCHUANICUM.

So far as I know, this is the most rapid of all hardy, ornamental climbers, and in consequence is of great value when it is desired to clothe an unsightly building, tree stump or any other objects as quickly as possible. Even when first planted it will make gratifying progress, but when a plant gets into its stride as it were, its progress is truly prodigious. Then, a shoot twenty feet in length, is quite an ordinary progression—twice that length is by no means beyond its abilities—and, as a vigorous specimen will produce many such shoots in a season, an extensive area is soon covered with luxuriant vegetation.

Quite early in the summer, and again in the autumn, this vigorous, at times rampant, climber produces abundant panicles of feathery, whitish flowers from side-shoots. When in flower it is exceedingly beautiful. Although seeds are rarely, if ever, produced in this country, the seed vessels often persist, and as they are tinged with red, they add to the attractiveness of the climber.

This showy Polygonum seems indifferent as to soil and will flourish in almost barren conditions, but it needs a light and open situation. A. C. B.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand. or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

IDEAL GARDENS AND PLANT LORE.

III.—IN HOMER'S WIDE DOMAINS.

FOR various reasons, Homer claims a place in the forefront of our studies. He is among the earliest of the poets whose writings throw light on the garden-craft of antiquity. From him the later poets of Greece and Rome drew their inspiration, and to him they owe, as do we ourselves, the various elaborations of the Gardens of Alcinous and Ulysses. He alludes to so many plants, and has so many references to nature, that I would have a spacious plot mid hill and dale, with reedy brook and shaded groves on the scale of Goodwood or Alton Towers, for the landscape gardener whom I would employ for my Homeric Garden. Those of Adonis, and others yet to be plotted, would fill up various nooks and corners, play hide and seek behind the rocks and scours, or spread themselves out by the lawns and sloping meads.

Take, by way of illustrating my idea, one or two of the many references contained in the Iliad. The translations are culled from many sources, the choice being regulated by the desire to make the best use possible of the quotations from the point of view of the horticulturist. There is the description of the wonderful shield of Achilles and its various adornment:—

"On it he represented, among other things, a soft, fallow field of rich glebeland, broad, thrice-ploughed, and in it many ploughmen drove this way and that, turning about their teams. And when they had come again to the end of the field, a man advanced and placed in their hands a cup of wine, honey-sweet. And the ground grew black behind them, looking exactly as though it had been ploughed, though the work was of gold, a marvel to behold."

Then follows the account of the vineyard, heavy laden with Grapes of great beauty; and though the clusters were of gold they, too, appeared to be purple black, supported throughout on props of silver. Virgins and youths of tender age and innocent mind bore away the luscious fruit in baskets woven of the withies which grew by the water's side. A pasture in a lovely grove full of white sheep and folds, with huts and cottages is also depicted. There is the picture elsewhere (*Il.* xiv, 120),

of the mansion opulent in resources, with corn-bearing fields and plants laid out in rows as in an orchard. The well-cultivated field is more than once in evidence, the newly-watered garden dried up by the north wind of autumn being also used to purpose by way of analogy.

We are led to the spot where the Elms are burned up together with the Willows and Tamarisks; the Lotus is consumed and the rushes and reeds which grew in great abundance round the beautiful streams of the river (*Il.*, xxi, 345). The wood, copse and grove are often mentioned, with "the nymphs who inhabit the pleasant groves and springs of water and the grassy meads," whom we shall be eager to surprise as we wander round the grounds at eventide. Once again we find ourselves watching the workman as he fells a mighty Oak, a giant Poplar or a towering Pine.

The Odyssey is also full of suggestion for the laying out of the grounds. Fountains play, rills meander through the meadows or down the hill-sides, crowning them with a luxuriant growth, amid which flowers blossom. Thus—referring to a cave with its attendant grotto, grove and glen, we have this delightful picture:

The cave was brightened with a rising blaze;
Cedar and Frankincense, an odorous pile,
Flamed on the hearth, and wide perfumed the isle.

* * *

Without the grot a various sylvan scene
Appeared around, and groves of living green;
Poplars and Alders ever quivering played,
And nodding Cypress formed a fragrant shade.

* * *

Depending vines the shelving cavern screen,
With purple clusters blushing through the green.

Four limpid fountains from the cliffs distil;
And every fountain pours a several rill,
In mazy windings down the hill;
Where blooming meads with vivid greens were crowned,

And glowing Violets threw odours round
A scene where, if a God could cast his sight,
A god might gaze, and wander with delight.
Od., v. 75-95 (Pope).

Truly a scene to make a mortal envious! Grottoes are mentioned elsewhere, and add much to the beauty of the scene. Frequently do we read also of the groves which crown the hills. Even the land which lies neglected by the inhabitants is rich in fruits and crops.

Yet here all products and all plants abound,
Sprung from the fruitful genius of the ground;
Fields waving high with heavy crops are seen,
And vines that flourish in eternal green;
Refreshing meads along the murmuring main,
And fountain streaming down the fruitful plain.

What then will be the case when the gardener, skilled in all the arts of the field, exercises his craft?

Thy careful hand is stamped on all the soil,
Thy squadroned vineyards will thy art declare,
The Olive green, blue Fig, and pendant Pear,
And not one empty spot escapes thy care;
On every plant and tree thy cares are shown,
Nothing neglected, but thyself alone.

Here, then, are hints for our landscapist, and we now have to consider our method of procedure. For the plotting of this far-reaching stretch of garden, field and woodland, with its hills and valleys, its river and streams, its corn-land and green sward, I would proceed somewhat as follows. From the terrace broad steps should lead to the garden, of which that of Alcinous shall be taken as the type. It is of the princely pattern beloved of Bacon, and he shall be called in to assist in the pleasing task of laying it out. Next to this will be the garden of Ulysses, which may be taken to represent the orchard. Pergolas covered with luxuriant vines shall lead away to meadow and stream, avenues of Plane trees shall conduct to the fat lands where the Olive flourishes, while the distant hills shall be crowned with Oak, Ash

and Beech. Partly under their shade—which shall not be like that of the Birdless Wood at the Duke of Richmond's, forbidding life of plant and fowl—and partly on the sun-flecked slopes shall be broad stretches of Hyacinth and Crocus, of brilliant Poppy and vernal or autumnal flowers, such as are alluded to here and there in a general way though they are not explicitly named.

Such being the broad outline, we may now proceed to the details. We begin with the Gardens of Alcinous, concerning which further particulars will be found in an article already published in these columns.* Pliny mentions the Gardens of the Hesperides, of Adonis and of Alcinous as being objects of great admiration among the ancients. In the Odyssey where the description is found, are doubtless many "exaggerations and distortions of merchants' and sailors' narratives." This, however, will not detract from our interest in the oldest and most beautiful description of an Ionian garden† which has come down to us through the ages. Already in Plato's days it would seem that the Odyssey was regarded as containing "tall talk" and travellers' yarns, for we read in the Republic (x., 614):

Well, I will tell you a tale, not like that of Odysseus to Alcinous, but of what once happened.

The Gardens of Alcinous, like those of the Hesperides are, as the author of the *Natural History of the Ancients* reminds us, "another proverbial Paradise." Alcinous was the just and rich king of the Phaeacians in Corcyra (the modern Corfu) devoted to gardening.

Ulysses approaches his domains, and he is instructed to go to a spot:

Nigh where a grove with verdant Poplars crowned,

To Pallas sacred, shades the holy ground;

and bending his way thither, he reaches the point where

A bubbling fount distils

A lucid lake, and thence descends in rills;
Around the grove a mead with lively green
Falls by degrees, and forms a beauteous scene.
Here a rich juice the royal vineyard pours,
And there the garden yields a waste of flowers.

By these tokens led, he reaches the palace grounds, and soon espies the wondrous garden, a description of which is now to be given. *Hilderic Friend.*

(To be continued.)

PLANTS NEW OR NOTEWORTHY.

RHODODENDRON ODORIFERUM.†

A NEW SPECIES OF THE MADDENII SERIES.

A SHRUB with stout, slightly punctulate branchlets; young shoots purplish, loosely covered with pale, flaky scales. Leaves elliptic to oblanceolate, obtusely rounded at both ends

* See *The Gardeners' Chronicle*, March 6, 1926, p. 174.

† Here we may read Gissing's *By the Ionian Sea*.

‡ *Rhododendron odoriferum*, Hutchinson, sp. nov. (Series Maddenii), affinis R. Maddenii Hook f., sed inflorescentiis 6-7-floris, corolla anguste tubulosa, staminibus 15 differt. Frutex, ramulis crassis leviter punctulatis, novellis purpurascens laxe lepidotis. Folia elliptica ad oblanceolata, utrinque obtuse rotundata vel basi breviter cuneata, usque ad 11 cm. longa et 6 cm. lata, supra glabra et nitida, infra dense lepidota, squamis parvis brunneis leviter inaequalibus et contiguis vel fere contiguis; nervi laterales utrinsecus 12, graciles sed infra distincti; petioli circiter 1 cm. longi, supra anguste canaliculati, crassi et minute punctulati; gemmae axillares inferiores sub-anthesin minimae, superiores crassae et ovoideae vel interdum innovationibus bene evolutis. Inflorescentia circiter 6-7-flora, subumbellata; pedicelli crassi, 1-1.5 cm. longi, laxi lepidoti, plerumque basi bracteola tenue lineare instructi, hac interdum cum pedicello adnata et calycis lobum simulante. Calyx obsoletus, undulatus. Corolla odorata, alba, extra roseo leviter suffusa, tubo intra viridescens extra lepidoto vix angulato circiter 4 cm. longo basi 1 cm. lato; lobi 5, leviter ovato-elliptici, apice rotundati, circiter 3 cm. longi, extra medium versus lepidoti. Stamina 15, breviter exserta, glabra; antherae brunneo suffusae. Ovarium 10-11-loculare, squamis tenuibus albidis laxe indutum; stylus fere ad apicem lepidotus stigmatibus carnosius lobulato magno coronatus

NEPENTHES MASTERSIANA

FIG. 16.—RHODODENDRON ODORIFERUM, HUTCHINSON.

Flowers white, scented. A. Scales on the lower surface of the leaf. B. Stamen. C. Anther. D. Calyx and pistil. E. Stigma. F. Cross section of the ovary.

or shortly cuneate at the base, up to eleven centimetres long and six centimetres broad, glabrous and shining above when mature, densely lepidote below, with small brown scales, the latter rather unequal-sized and contiguous or nearly so; lateral nerves about twelve pairs, very slender but distinct below; petiole about one centimetre long, very narrowly grooved on the upper side, thick and minutely punctulate; lower axillary buds quite small at flowering time, the upper ones thick and ovoid or occasionally the leaf-shoot fairly well developed. Inflorescence about 6-7-flowered, sub-umbellate; pedicels stout, 1-1.5 centimetre long, laxly scaly, usually with a thin, linear, brownish bracteole at the base, or sometimes these adnate up to the calyx and resembling calyx-lobes. Calyx an undulate rim, not ciliate. Corolla scented, white, slightly flushed with rose on the outside, the tube inside tinged with green; tube scaly all over the outer surface, not angled, about 4 centimetres long, 1 centimetre broad at the base; lobes 5, broadly ovate-elliptic, rounded at the apex, about 3 centimetres long, scaly near the middle outside.

Stamens 15, shortly exserted, quite glabrous; anthers tinged with brown.

Ovary 10-11-celled, loosely covered with thin, whitish scales; style nearly as long as the corolla, loosely scaly nearly to the top, with a large, fleshy, lobulate stigma. Capsule not seen.

Habitat: Southern Tibet; Upper Nyam-sang Valley; 8,000 feet; described from a cultivated plant at Kew, raised from seed received from Edinburgh in 1914 (Edinburgh 4-1914).

It has long been known that there are several forms of *Rhododendron Maddenii* in cultivation, most of which are desirable garden subjects. The plant here described seems sufficiently distinct to deserve a separate name, which is given in reference to the delicious scent of the flowers. To those who are familiar with *R. Maddenii*, the close affinity of this new species will be obvious. It differs chiefly in the several-flowered inflorescence (in *Maddenii* there are usually only two to four flowers), in the narrowly-tubular, scarcely angled corolla with rounded lobes, and in having fifteen instead of the usual twenty stamens.

In one of the specimens I have had before me for description, an unusual feature is shown in that some of the bracteoles are adnate to the pedicel nearly to the apex, and they then resemble elongated calyx-lobes. The calyx, however, is merely an undulate rim.

In *Notes of the Royal Botanic Garden, Edinburgh*, 1919, I gave a comprehensive account of the *Maddenii* series of *Rhododendron*, including descriptions of a considerable number of new species. I found little difficulty in classifying the species of the two more primitive subseries, *Maddenii* and *Megacalyx*, but I was considerably troubled with subseries *Ciliicalyx*. It is satisfactory to note, however, that several of the species described then from herbarium specimens and distinguished by apparently somewhat trivial characters seem to retain their characteristics under cultivation. One of the best of these is *R. Scottianum*, and another charming plant is *R. supranubium*. Some of these species would, no doubt, be useful for crossing with the best of the *Triflorum* series, for there is undoubtedly a close phylogenetic connection between the *Maddenii* and *Triflorum* groups, the former being the older. The more primitive types are represented by *R. Maddenii* itself with its numerous stamens and ovary cells, and another primitive species is *R. polyandrum*, which has twenty-five stamens. A progressive reduction is observable in subseries *Megacalyx* in the number of stamens (15-10), and of the ovary cells (5), whilst a new habit has been adopted by the epiphytic *R. Dalhousiae*. This habit is repeated in subseries *Ciliicalyx*, *R. dendricola* growing on the tops of large forest trees. The nearest point of contact between the *Maddenii* and *Triflorum* series seems to be represented by *R. supranubium*, which has an inflorescence never more than three-flowered, and very often only one-flowered. *J. Hutchinson, Kew.*

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

"Who shall decide when doctors disagree? The fine *Meconopsis* figured on page 449 of *The Gardeners' Chronicle* for June 25 is named by Mr. Grant White, M. Bailey and, on the same page, *M. betonicifolia* by Mr. A. M'Cutcheon of the Edinburgh Botanic Garden. It is to be hoped that the latter title may hold good, thereby averting confusion with a very different species—*M. simplicifolia* var. *Baileyi*. Under whatever name this beautiful Poppywort is to be known officially, it is a great acquisition, and if it proves, as reported, to be a true perennial, its value will be greatly enhanced. *Meconopsis simplicifolia*—both the dark blue type and Bailey's sky-blue variety—sometimes survives to flower in a second season; would that it had the constitution of the Welsh Poppy, *M. cambrica*, which is a troublesome and most persistent weed in the garden, though its yellow and orange flowers are welcome in woodland where, however, it may only be naturalised if rabbits come not, for they never give it a chance.

Incarvillea never displays its crimson trumpets to better advantage than in woodland. We grow one species here under the name it brought with it many years ago—*I. brevipes*—a title which is not confirmed in the *Kew Hand List*, so I know not whether it may be *I. compacta* or *I. grandiflora*. Anyhow, it flowers in May and is followed by *I. Delavayi* in June. Hitherto we have protected *Incarvillea* against rabbits with wire-netting; but I am not without hope that this may prove unnecessary, seeing that it has escaped and flowered outside the netting without paying the penalty of being devoured.

One does not meet with *Incarvillea* in as many gardens as its perfect hardiness and remarkable beauty should ensure it a place. Probably many plants are destroyed in forking over the borders in spring, for it is very late in starting into growth, and the young leaves being dark brown are very apt to be overlooked unless the place is securely labelled.

Nothing brings old friends, living or lost, more surely and tenderly to mind than the flowering of plants which they have given us. Thus do two species of *Senecio*, now coming into bloom, remind me of that generous amateur, the late Sir John Ross, of Bladensburg, who gave me cuttings some years ago. One of these is *S. Huntii*, from the Chatham Islands, where it grows to a height of twenty feet. It bears abundant panicles of yellow flowers resembling those of the better-known *S. Greyi* and, like that species, carries its dense, silvery foliage throughout the winter. The other is *S. Hectori*, from the South Island of New Zealand, a very fine species bearing showy flowers with white rays; the large pale green leaves are six to twelve inches long, and three to four inches broad, a short space at the base of each being pinnate, a feature distinguishing this shrub from all other species of a vast genus. New Zealand is peculiarly rich in *Compositae*. The late Mr. Cheeseman enumerated thirty species of *Senecio*, a genus of which we in Britain reckon eleven as native, and are most familiar with the common Ragwort and the too common Groundsel, beloved by goldfinches.

Wealth of choice among the hundreds of new species of *Rhododendron* now in cultivation in this country ought not to cause us to forget such old and well-tried friends as the North American *R. maximum*. Introduced so long ago as 1736, one does not often meet with it in British gardens, yet it possesses points to recommend it. It is perfectly hardy and produces its pretty trusses of pink or white flowers, each richly spotted with tawny green, after midsummer, when nearly all species of *Rhododendron* have shed their blossom. Among its native hills it grows over thirty feet high; but I have seen none in this country over ten feet.

Solanum crispum is in great beauty just now. One usually sees it grown against a wall, but it is better to keep that protection for plants that require it, which this *Solanum* does not. Planted in the open, it has formed a rounded

bush, eight feet high, and is loaded with lilac and orange blossoms. The Glasnevin variety is far superior to the type, especially as, being sterile, it continues to flower from the beginning of June till checked by autumn frost. It is readily propagated from cuttings. *Herbert Maxwell, Monreith.*

NOTES FROM A WELSH GARDEN.

THOUGH the rainfall was unusually slight and the nights cold and often frosty, the latter part of May and the month of June were marked by an abundance of blossom on subjects of almost every kind. Being retarded by the low temperature of earlier days, *Genista fragrans* did very much better than usual, the bushes being heavily laden for many weeks with the warm, orange-yellow, deliciously-scented flowers. This was soon followed by that excellent species, *G. virgata*, which is now (end of June) a billowy mass of delicate lemon-yellow, which has such an attractive setting in the silken silveriness of the foliage. In the rock garden, *Cytisus glabrescens* was in its own way equally delightful, making a low, dense mound of richest gold. This dwarf, deciduous species, which comes from the Lepontine Alps, bears its flowers, which are large for the size of the bush, on the previous year's wood. It has merit and distinction enough to win for it a prominent place among rock garden Brooms. *C. Tomassinianus*, its abundant, trefoil leafage in a fresh grassy green, and terminal clusters of sulphur-yellow, is a newcomer here, but it seems hardy, and gives good promise as a rock garden subject.

Among the yellow Sun Roses, two species always attract a large share of admiration. These are *Helianthemum Libanotis* and *H. lunulatum*. The former, a thin-habited shrub somewhat after the style of *H. umbellatum*, but with even narrower leaves of a much paler green, bears an abundance of blooms, each nearly one inch across, in a lovely shade of bright yellow. The other, perhaps better-known, is as close and compact as an alpine Phlox, making a silvery-green, cushiony mass, which it adorns with quantities of little yellow flowers on long pedicels of the same colour. This very charming shrublet is seldom out of bloom the season through, and it can always be distinguished by the tiny crescent of orange at the base of each petal.

Abutilon megapotamicum, put in a few years ago as an experiment, has never looked back, in spite of hard frosts and a northerly aspect. The first of this Brazilian plant's nasturtium-yellow flowers slipped out of its blood-red calyx early in May, and every branch is now hung with these curious "lanterns." In a similar aspect, *Tricuspidaria lanceolata* has never done better, not having lost a bud in spite of the severity of the early spring, and another evergreen which too often gets snubbed into flowerlessness, but which has this year escaped, is *Raphiolepis japonica*. The terminal panicles of large white bloom borne by this handsome evergreen are very sweetly scented.

Leptospermums are, perhaps, not quite so good as they were last year. Still, these beautiful shrubs can always hold their own in any June garden; their elegance of habit and delightful foliage being hardly less attractive than the unique charm of their lovely blossoms. There would seem to exist a good deal of confusion regarding the varietal names in this genus, inevitable, perhaps, in shrubs so easily raised from seed and so apt to vary in the colour and size of the blossoms. In his great work on trees and shrubs, Mr. W. J. Bean informs us that *Leptospermums* are "easily increased from cuttings," but I have found them uncommonly difficult, that is, without bottom-heat. Among the red-flowered varieties of *L. scoparium* the variety *Chapmanii* with blood-crimson blooms seems to be less apt to bleach than the ruby-red var. *Nicollii*. One of the several specimens that have come here labelled *L. Boscawenii* is conspicuous for the size of its blossoms, and they are not only a good clear white with a purple eye, but each petal has a streak of carmine.

L. laevigatum, though comparatively small in the blossom, is a very pleasing member of this genus, and no less satisfactory. I am told it is an Australian species.

As flowering shrubs, the grey-leaved *Veronicas* are not particularly striking, but *V. Gibbsii* is an exception. This has a rather prostrate habit; the almost orbicular leaves are a steely-grey, and the cone-shaped inflorescences composed of flowers which are not only a good, firm white, but unusually large. A specimen of *Styrax Wilsonii*, about five feet in height, is now very beautiful, every twig being adorned with nodding, bell-shaped flowers in a glistening ivory-white.

A conspicuous object near the water is *Phormium Cookianum*. This species, which does not exceed about two feet in height, is earlier to flower and hardier than the better-known *P. tenax*, and it is a much more reliable bloomer. The plant referred to has now half-a-dozen flower spikes, these rising to about four feet, being very ornamental with their glossy vermilion and yellow blossoms. Near this, but in rather drier ground, *Primula suffrutescens* is carrying several heads of rose-pink flowers. Here also, and in telling contrast with the fine yellow "slippers" of *Calceolaria John Innes*, is a little colony of *P. capitata Mooreana*, its rich Tyrian violet being accentuated by the white mealiness of the stems. Though this fine form is undoubtedly very superior to the type, I have not yet found it to be much more permanent.

Among the mid-season Heaths, *Erica cinerea* var. *coccinea* is always distinct and generally first of its race to show colour. It is not only unique in its very dwarf nature and wonderfully rich crimson, but the latter has in it that tendency to scarlet so rare in hardy Heaths. Another first-rate early one of medium height in this class of Heath is *E. c.* var. *Frances*, the flowers being a vivid cerise. For associating with dwarf Heaths, *Bruckenthalia spiculifolia* is a very desirable little Ericaceous plant, its close-set mat of bright green now bristling with rose-pink flower-spikes, about two inches in height.

Geranium anemonaefolium opened its first blooms this season before the end of May. This is unquestionably the finest of all the taller *Geraniums*, and it is hardy enough to withstand some 15° of frost. The colour of the large blossoms might be described as a rose-carmine, deepening to a ruby eye, and the broad and fleshy, palmate leaves are distinctly handsome. If this magnificent *Geranium* cannot be considered so perennial as, for example, *G. pratense*, it is certainly not a biennial, healthy plants that are allowed to ripen their seed often doing well for three or four years. *G. Loweii*, a true biennial, is as ornamental in the woodland and Heath garden as the foregoing is in the border. It naturalises freely, and the large leaves and stout, angular stems develop brilliant autumn tints. *G. refractum* is a species not to be lightly passed over in a mixed border, the saucer-shaped flowers being nearly two inches across and a clear wild rose-pink. Though its red flowers are comparatively dull and small, *G. macrorrhizum* always deserves a place for the sake of the fragrance which emanates from all parts of the plant. The dull green leaves of this old *Geranium* are broad and bluntly lobed; it grows to about twenty inches and makes a neatly rounded mass which never needs staking or other support. *A. T. Johnson, Ro Wen, Conway, North Wales.*

SOME GARDEN BUILDINGS.

IN order to become worthy additions to the amenities of a garden, buildings must be in complete accord with their environment, each a part of a harmonious whole; they should fulfill a direct mission, either utilitarian or artistic, and in several instances, hereafter indicated, should portray local handicraft and feature local material. This latter proviso is a simple natural law, for the local products will be an institution of Nature herself.

An old manor house will call for old-time treatment, and very few things can be more picturesque or restful than thatched tea houses,

summer houses or tennis pavilions; the walls may be of local timber, perhaps Larch, with the bark retained, or it may be of local stone and either will be in accord with the surroundings, pleasing, and not in any manner obtrusive.

Glass structures in some situations and for some purposes, may be ornamental as well as useful; I can visualise a large shrub house with timbered back "wall," lightly and strongly constructed, with removable roof and sides, and of sufficient size to counteract insignificance; a splendid home for half-hardy and choice shrubs and plants and a pleasing feature of the garden.

Thatching is becoming a rare handicraft; should it be entirely lost, a beautiful English feature will have disappeared. A thatched building can scarcely strike an incongruous note in the garden, unless it be in too near proximity to a modern house; where thatch, in straw or reed, is not desirable, roofs of local stone tiles, admittedly somewhat expensive, will be natural and pleasing, infinitely superior to slate, which is unsurpassable, perhaps, in its proper utilitarian sphere, and preferable to the strident and wholly unsuitable manufactured red tiles.

Formal gardens may be treated formally, hence the elaborate stone loggia will be happily and appropriately placed in the Italian garden.

Where old buildings, barns, garden houses, etc., exist, it is oftentimes wiser to renovate these, if they are suitably placed, rather than embark upon new ventures; garden building construction must, at all times, be entered upon with extreme caution, and with a breadth of vision encompassing the garden as a whole. Gardens may be irretrievably ruined by ill-advised buildings, as their beauties may be greatly enhanced by the work of a garden artist.

It is well to remember that trees, shrubs and plants are the glory of the garden; the inanimate things are adjuncts to the animate, their duty being to enhance, not to alter or to mar. *Ralph E. Arnold.*

INDUSTRIAL PSYCHOLOGY.

A REPORT* of the first systematic attempt in Great Britain to apply the point of view and methods of industrial psychology to agriculture has just been published by the National Institute of Industrial Psychology. An investigation was carried out last autumn at the South-Eastern Agricultural College of the University of London, at Wye, and at various farms all within the county of Kent. The object of the investigation was to demonstrate in a practical and scientific manner that industrial psychology could be usefully applied in agriculture as well as in the manufacturing industries, mining and commerce, but it was not expected this would lead to the same immediate reduction of waste of time and fatigue as it often does in a factory. It has to be remembered that in agriculture, unit costs are to a very large extent determined by natural yield, while the organisation of the work itself is, to a large extent, regulated or governed by factors of nature beyond immediate control of man. Moreover, although there are 1,500,000 persons in Great Britain directly dependent on agriculture, a single farm which employs more than a dozen regular hands is a rarity. But the report undoubtedly indicates methods whereby Great Britain may increase her home-grown food supply on an economic basis. The investigation was carried out by Mr. Dunlop, who was Scientific Adviser in the West Indies, and Sir Daniel Hall, Chief Scientific Adviser to the Ministry of Agriculture, urged that it should be published as an example of a field that needs to be explored. Mr. G. S. Orwin, Director of the Agricultural Economics Research Institute at the University of Oxford, pointed out the need of far more work on the whole question.

Generally, the report deals with worker's unproductive time, general lay-out, arrangement of material, methods of payment, suitability of

* Report of the National Institute of Industrial Psychology: No. 2. An Investigation of Certain Processes and Conditions on Farms. National Institute of Industrial Psychology, 329, High Holborn. Price, 2s.

tools, and the selection of the worker, according to his special ability for the work he is to undertake. A few of the more interesting examples from the report may be given. It is pointed out that in cases where agriculture merges into industry, as in the picking, grading, and packing of large quantities of fruit, the particulars presented striking results.

It was found, for example, that in picking Strawberries—the most fatiguing of all fruit to gather—a fast picker spent thirty-two minutes of the hour in actual picking, seventeen minutes walking from plant to plant with basket, 8.5 minutes in fumbling at the leaves, and 2.5 minutes in carrying in the load and returning. The Institute of Industrial Psychology therefore suggests to Strawberry growers that it is important that the plants should be as close together as possible, that high yielding types of plants should be selected, and that the packing sheds should be situated at the most convenient points in relation to the general lay-out of the beds.

Another question of interest to all who have glasshouses is the enquiry made into the qualities needed for workers in conservatories. It was pointed out that the ideal worker in a glasshouse should be of small stature. Very tall men or women take up too much room and are usually clumsy. They should be capable of working without discomfort in a warm and humid temperature, and be sympathetic and interested in delicate plants.

Investigations also proved why milkmaids throughout history have been regarded as more competent than milkmen. It was found that in general female milkers were more patient and more talkative than the male workers. The women's method of handling cows was much superior to that of the men, and they spoke to them more sharply when they were troublesome, as if they were speaking to a very naughty child. But if the report is carried into effect, it means the doom of the ordinary three-legged milk stool that has figured in so many pictures and songs, for it is said that the ordinary stool is seriously defective, in so far as its height is not adjustable, and that it would be far better to have an adjustable stool, similar to the piano stool, to suit the height of different cows and milkers.

It was found that there was considerable apathy among farm workers, and it is hoped to arouse more enthusiasm and ambition among them in order to stimulate them to greater effort, accompanied by higher reward, both to themselves and their employers. The report discusses the lack of success of Great Britain in matters of agricultural co-operation, in spite of the fact that the great need of such co-operation is widely recognised, and it is thought that an investigation of this apparent prejudice against co-operation should be undertaken from a psychological point of view. *B. S. Townree.*

NOTICE OF BOOKS.

A New Manual of Trees and Shrubs.*

ONE of the main characteristics of the late Professor Sargent, the veteran botanist, who passed away in March last, was his singular capacity in attracting and keeping able coadjutors. Those who worked under his direction were stimulated to mighty deeds and herculean labours. The small staff of the Arnold Arboretum, over which Sargent presided as Director from 1873 till the day of his death, produced in those years an astonishing and continuous flow of useful botanical literature. The mere list of the books, pamphlets and articles, of which Sargent was editor or author, covers eight pages in the last issue of the *Journal of the Arnold Arboretum*.

The greatest of these works was, perhaps, the *Silva of North America*, in fourteen huge volumes, the text by Sargent, and 740 plates, drawn by Faxon, and engraved on copper plates by the famous French artists, the two Picarts and Riocreux. The *Bradley Bibliography*, in

* Manual of Cultivated Trees and Shrubs. By Alfred Rehder, New York. The Macmillan Company. 1927. Pp. xxxvii + 930. Price 2 guineas.

five quarto volumes, comes next in importance, being a guide to the literature of the trees and shrubs of the world published up to the end of 1900. This was compiled under the direction of Sargent by Alfred Rehder. *Plantae Wilsonianae*, an enumeration of the trees and shrubs of Western China, was edited by Sargent and written by a team of able botanists, of whom Rehder and Wilson took the greatest burden. This book is indispensable to all arboriculturists. It may be seen from these examples how valuable have been the contributions of Sargent, Rehder, and Wilson to descriptive botany.

In the last fifty years, so great has been the number of trees and shrubs introduced into our parks and gardens from China, Japan, North America, Chili, Tasmania and New Zealand, that the need of a handy book for their determination has been urgent. Meritorious works on a large scale, such as Bean's valuable treatise in two volumes, were at our service; but a concise dendrology in an octavo volume, embracing all the trees and shrubs in ordinary cultivation in a temperate climate, did not exist in English. The Germans, as usual, were ahead of us, as they had Koehne's *Deutsche Dendrologie*, published in 1893, and, of course, now out-of-date, but still indispensable to students acquainted with the German language.

The Manual before us by Rehder surpasses Koehne's classic work in all respects. It includes all the latest introductions, and is encyclopaedic in its scope. It embraces 468 genera distributed amongst 112 families. The number of species fully described and represented in the keys is 2,350, with 2,465 varieties. Besides these, there are one family, thirty genera, 1,265 species and 507 hybrids only briefly described or mentioned and appended to the families, genera and species to which they are most closely related, or in the case of hybrids, to one of the parents.

The sequence of the families is according to the system used by Engler and Prantl in their *Natürliche Pflanzenfamilien*, and in Engler's *Syllabus*. This need not puzzle the amateur accustomed to the De Candolle arrangement, as the admirable Index, which is given pp. 861-930, will enable him at once to trace the genus or species to its proper page.

The international rules of botanical nomenclature have been followed, and therefore the names agree with those used in American books, such as the second edition of Bailey's *Cyclopedia of American Horticulture*. As this is the standard adopted in the main by the last edition of the *Kew Hand List of Trees and Shrubs*, published in 1925, conservative readers need not complain over much at the unfamiliar nomenclature occasionally employed by Rehder. The trouble with the Vienna nomenclature is its instability, and of this I may give a striking example. The old and familiar name of the Chinese "Tree of Heaven," is *Ailanthus glandulosa*, Desf. In 1925, the Kew Hand List quotes as correct Vienna Rule usage, the name *Ailanthus cacodendron*, Schinz and Thell. In 1927, Rehder adopts, also according to the Vienna code, another name, *Ailanthus altissima*, Swingle. Another ludicrous example of the effect of the Vienna code is seen in the use (p. 563) of *Acer saccharum* for the Sugar Maple, and (p. 576) *Acer saccharinum* for the Silver Maple, practically the same name for two absolutely distinct trees. The worst fault of the Vienna code, however, is the change, by which an old familiar name is transferred from one species to another species. Everyone knows the name *Quercus rubra* for the Red Oak. The new rule applies this Latin name to the totally different Spanish Oak (p. 167).

However, I need not linger on the vexed question of nomenclature. Unstinted praise may be given to the accuracy of the descriptions, the usefulness of the keys, the excellence of the paper and the clearness of the printing. I have only noticed one erratum: the word "scarcely" is wrongly spelled on the sixth line from the foot of page 31. The proof-reading has been, indeed, most careful. The introduction (pp. i-xvi) explains the scope of the work, and justifies the nomenclature used. This is followed by two useful lists, one explaining the abbreviations of authors' names and the other the abbreviations of the references to illustrations. The year in which each species was

introduced and its native country are invariably given. The two genera, *Crataegus* and *Rhododendron*, being extremely rich in species and varieties, have required special treatment, only representative and common forms being described. It is interesting to know that over 600 species of *Crataegus* are growing in the Arnold Arboretum, but only forty-two species are included in the Manual. His remarks on *Rhododendrons*, p. 679, are worth quoting:—"More than 400 species distributed through the colder and temperate regions of the northern hemisphere, also on the high mountains of South Asia and Malaysia and extending to New Guinea and Australia; twenty-six species known in North America, but none extending into Mexico. Many hybrids have originated in cultivation and make the classification and determination of the garden forms difficult. To give a fairly complete record of this ever-increasing number of hybrids is manifestly impossible within the scope of this Manual, and only the more important and better-known forms are mentioned. Also the many new species recently introduced from South-west China, and found only in a few large collections in England, whose hardiness within our area has not yet been tested have been omitted. Descriptions of most of them will be found in Millais, *Rhododendrons*, two vols. (1914-24)." Mr. Rehder wisely contents himself with giving a key for sixty-two species, followed by a careful description of each of these species, with mention of their hybrids, and in most cases mention also, with a short note, of allied species. Lately, while on a visit to the Edinburgh Botanic Garden, I enjoyed seeing the extremely rich collection of *Rhododendrons* there, and learned to my surprise, that about one million seedlings of numerous species were in cultivation in the gardens. The extraordinary richness of this genus in species, varieties and hybrids is extremely remarkable.

In conclusion, I congratulate Mr. Rehder on the production of this excellent manual, which should be useful to botanists, gardeners and foresters in every part of the world, outside the tropics. A. Henry.

THE POWDERY MILDEW OF FLAX.

In March last we received from Dr. A. W. Henry (an American pathologist who is on a visit to this country to study the diseases of Flax) a powdery mildew on the stem and leaves of seedlings of Flax (*Linum usitatissimum*) grown in a greenhouse of the Botany Department of the University of Cambridge. The plants were infested on both surfaces of the leaf, and more densely on the main stem. The characters shown by the fungus are illustrated in Fig. 17; the upright branches of the white mycelium bear oblong spores (conidia) which are produced either singly at the tip or in a chain of two or three. The size of the spore varies from $31-40 \times 12-16\mu$, and the average size of forty spores measured was $34 \times 14\mu$.

Just previously there had been published in the *Review of Applied Mycology*, IV, 125, 1927, a review of a paper by Dr. V. Skorić, on the Powdery Mildews of Croatia, stating that "on the Flax there was found an, up till now, unknown Powdery Mildew, but only in a conidial form." To this fungus the name *Oidium Lini*, n. sp., was given, and it was described as having oblong conidia, two or three in a chain, $26-41 \times 12-15\mu$. Dr. Skorić adds the following note (for the translation of which we are indebted to the courtesy of Mr. S. P. Wiltshire, of the Imperial Bureau of Mycology): "Oudemans cites it on Flax (*Enum. system. fung.*, III, p. 1017, *Erysiphe communis* (syn. *E. polygoni*)), but the fungus here described clearly differs from the above-mentioned by the size and shape of the conidia, and especially by the large fibrosin bodies."

Since the characters of the Powdery Mildew on Flax growing at Cambridge agree with those of *Oidium Lini* from Croatia, it might have been concluded that here was an instance of a new fungus finding its way from the Continent to England, but in mycology, as elsewhere,

things are not always what they seem, and the student of the systematic classification of the Erysiphaceae (powdery mildews) is only too familiar with hosts of "bad species" that have appeared from time to time on the scene. In the present case it appears probable that an addition may have to be made to the list of "bad species," since the characters of this powdery mildew on Flax agree in all respects with the conidial stage of *Erysiphe polygoni* on certain host plants. Those interested in the subject will find illustrations of the conidial stage of this species in an article by one of us in the *Journal of Botany*, XLIII, 41, tab. 469 (1905). Mention is here made of the conidial stage of *E. polygoni* on *Clematis*, with its oblong-cylindrical spores measuring $28-42 \times 14-16\mu$, produced occasionally in short chains.

We are indebted to Mr. W. C. Moore, of the Ministry of Agriculture's Plant Pathological Laboratory, Harpenden, for calling our attention to the record of *Oidium erysiphoides* (the name given to the conidial stage of species of the Erysiphaceae) on *Linum usitatissimum* in Rabenhorst's *Flora of Germany, Austria and Switzerland*.

In 1899, Professor P. Magnus gave a description of the powdery mildews occurring in the Tyrol, in which the following note occurs (kindly communicated to us by Mr. J. Rams-

FIG. 17.—POWDERY MILDEW OF FLAX.

Two conidiophores bearing short chains of spores, together with free ripe spores $\times .250$.

bottom): "Professor F. Wagner has collected an *Oidium* on *Linum usitatissimum* in a field of Flax much infested with it at Gries am Brenner, and has kindly communicated the fact to me. I do not find the occurrence of a powdery mildew on Flax recorded in any book. On the other hand, in the Herbarium of the Berlin Botanical Museum, there is an *Oidium* on *Linum usitatissimum* from Schnepfelthal in Thuringia, collected in September, 1869, which came from A. Brauns herbarium. This specimen is labelled *Erysiphe lamprocarpa*? Conidial stage. Very frequent on cultivated Flax. Judging by the handwriting, it may have come from A. de Bary. The mildew appears, therefore, to occur frequently on Flax." De Thuman (*Grevillea*, VIII, p. 49, 1879-80) has recorded the occurrence of *Oidium erysiphoides* on *L. usitatissimum* in Egypt (near Senura in Fajum). Lastly, Dr. F. Stráňák, in a description of the diseases of Flax, states (*Ochrana Rostlin*, VI, 3, 37, 1926): "Under damp weather conditions, Flax may be attacked by the mildew *Erysiphe polygoni*, which on the leaves and stem forms a whitish powdery film, resembling flour."* It is not stated whether the identification was made from the conidial or the perithecial stage.

It appears, therefore, very doubtful whether the powdery mildew of the Flax has ever been found in the perithecial stage, and until this has been done, its name cannot be determined with certainty. All that can be said at present

* We are indebted to Mr. S. P. Wiltshire for kindly furnishing us with this translation.

is that it agrees in its characters with the conidial stage of *Erysiphe polygoni*, and may possibly prove to be that species.

Passing from the consideration of the correct name, we may now discuss the possible origin of the fungus and its relation to the control of the disease. Knowledge as to the name of the mildew might tell us whether it occurs also on other cultivated or wild plants. Even if this is so, it must not be assumed that the mildew can readily pass from its other hosts to Flax, since, in the family of powdery mildews, a strict specialisation of parasitism has taken place, the effect of which has been to restrict the range of each specialised form to members of the same, or a closely related, host-genus. If Dr. A. W. Henry now discovers the perithecial stage of the Flax mildew, and can also carry out experiments to ascertain if the conidia can infect other species known to be hosts of *E. polygoni*, he will confer a benefit on the country he is visiting, and the thanks of our agriculturists and horticulturists will be due to him.

We have not met before with the mildew on Flax in this country and we have not been able to find any record of such occurrence. We have been informed, both by Miss E. M. Wakefield and by Mr. J. Ramsbottom, that no specimen exists in the National Herbaria at Kew and South Kensington.

With regard to treatment of Flax mildew, it is probable that dusting with "flowers of sulphur," or finely-ground sulphur, will prove as efficacious as it is in the case of other powdery mildews. We would ask the readers of this Journal to keep a look-out for the powdery mildew on Flax, and to be good enough to send any specimens found to Dr. A. W. Henry, School of Botany, Cambridge. As pointed out above, for the complete identification of the fungus, the perithecial stage is required, and this may be present on material gathered in the summer or autumn. *E. S. Salmon and W. M. Ware, Mycological Department, South-Eastern Agricultural College, Wye, Kent.*

FRUIT GARDEN.

THE APRICOT.

Of all hardy fruits grown in Britain, perhaps the least success attends the culture of the Apricot. There are some very fine trees in existence, and some of considerable age, but usually the life of an Apricot tree is all too short. To state a definite reason for this comparative lack of success is not at all easy; as is well-known, branches, and occasionally whole parts of a tree will die without any apparent reason, and the one method of obviating this is to train in young growths, thus always having material at hand for covering bare spaces.

South-west and western aspects are best for the Apricot, at any rate, in the north; in the southern counties, trees in an eastern aspect have frequently produced crops of tolerably good fruits, but except under exigent circumstances, such a position should not be allotted Apricot trees.

The Apricot needs a calcareous, rich loam, but no manure; heavy soils may be improved by the addition of charred refuse or ashes from the garden fire. Very careful planting is most important; the roots should be arranged carefully and the interstices between them filled with fine soil to a depth of four inches. A mulch of long manure will serve to protect the roots from winter frost, and one of "shorter" material will protect them from summer's sun. The trees should be pruned in summer, retaining all shoots that are not too vigorous to be trained in for fruiting next year; continue to tie in the shoots as necessary throughout the summer. Winter pruning consists in removing badly-furnished or naked shoots, but branches should not be cut away; strong shoots of the previous season should be shortened to the ripened wood, and weakly growths about one-third their length. The lateral spurs should be retained, for they usually produce fruits, and especially in the variety Moor Park.

A knowledge of varieties is essential, as many

sorts bear fruits on the shoots of the previous year, whilst Moor Park fruits on two- or three-year spurs, as do one or two other sorts.

Fan-trained trees are usually preferred, and cordons also prove successful; it is, however, only in very favoured districts where standards may be planted with hope of success. The Apricot is one of the earliest fruits to expand its blossoms, therefore protective material should be ready in case it is needed. It is important to remove all superfluous growths, so that in late summer the embryo fruit buds and the fruiting shoots may be exposed to all the sun available; persistent summer stopping of the growths is also highly important. The trees should be sprayed with water during the early summer, and this, with generous feeding of the roots, will greatly assist the fruits to swell. Apricots are successfully grown in orchard houses, and this, perhaps, is the most satisfactory method; pot trees commence flowering in a very young state. Forcing is not practicable, but the fruiting season may be forwarded a little by maintaining slightly warmer conditions in the house after the fruits have set, but prior to this stage a temperature of 45° will prove sufficient; after the stoning period, it should be raised to 50° to 55° but caution is necessary. The ripening period may be retarded by removing the trees in June to a cool position in the open, such as on the north side of a wall.

The Apricot, originally Abricock, was probably introduced into England during the reign of Henry VIII.

Moor Park is the best variety; the fruits of this sort ripen in August-September. The flesh is juicy, and the fruit of splendid colour. It may prove necessary to check the vigour of this variety by judicious root-pruning. This fine Apricot first appeared at Moor Park, Hertfordshire, in 1760, but whether it was raised there or introduced is not clear. The variety Royal ripens its fruits at the end of July; they are of moderate size, pale in colour with a deeper flush. It is a deliciously flavoured Apricot, and was raised in Paris in 1813. Frogmore Early ripens early, in mid-July; the small, round fruits are yellow with a red flush; the flesh is orange-coloured and of good flavour. This variety was raised at Frogmore in the seventies. St. Ambroise is a very large, late Apricot, of agreeable flavour.

Excellent hardy varieties are Luizet, ripening in mid-July; Blenheim, which ripens a fortnight earlier than Moor Park; Breda, the hardiest and best variety for cultivation as a standard, and Hemskirk, which is very like Moor Park, but said to be of stronger constitution. Pêche de Nancy is a fine variety, ripening in early August. The fruits are of fine colour, large in size, and rich in flavour. This sort is not subject to mealy flesh, a common fault with Apricots if allowed to hang until they are quite ripe. *Ralph E. Arnold.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

The Fruit Crops.—It would be interesting if those who send notes on the fruit crops would state which varieties escaped damage by the severe frost of April 27, and the names of those that were almost or entirely spoiled, with any further particulars that may appear necessary. Frost was general on this date over a large part of the Kingdom and occurred when the majority of Apples, Pears and Plums were in bloom or the flowers on the point of opening, throughout the southern districts. In my garden it is remarkable how well Fearn's Pippin Apple escaped damage and set a large crop; this Apple may be hardier than others and still worth planting for that reason. About half the flowers were fully open when the frost occurred. The same remarks apply to James Grieve; other varieties that had no flowers expanded were Cox's Orange Pippin, Lane's Prince Albert and Newton Wonder. Trees of these sorts are carrying good crops. The worst failure is Bramley's Seedling, and I have

heard other complaints about that variety; another bad case is Raspberry Lloyd George, but Laxton's Bountiful and the Hailshamberry have splendid crops and the berries are swelling freely. Black Currants are also doing remarkably well. Pear trees were in flower when the frosts occurred and the crop failed entirely. There are numbers of very large Williams' Bon Chrétien Pear trees in this parish, which flowered very freely and had shed their blossoms before the frost came, but scarcely one fruit can be found on them. *W. H. Divers, V.M.H., Westdean, Hook, Surbiton.*

Orchis foliosa × O. maculata.—With reference this plant, which was described by Mr. Boyd, on p. 431, vol. LXXXI, it may be of interest to your readers to know that it originated here as a natural cross on the banks of the lake. The plant at Kew is the one I sent, and the late Mr. Rolfe wrote me a very full detailed report of the hybrid. About twelve plants appeared, varying considerably in their relation to the parents. The plant sent to Kew was most typical of both parents. Some of the hybrids have no spots on the leaves, the dual character appearing in the shape of the leaves and flowers. *Orchis foliosa* was probably the seed parent, as the hybrids appeared in close proximity to that species and the few plants of *O. maculata* were some distance away. *A. Buchan-Hepburn, Smeaton, East Lothian.*

FOREIGN CORRESPONDENCE.

THE ORIGIN OF GLADIOLUS PRIMULINUS HYBRIDS.

THE very interesting article by Mr. James Kelway on the Gladiolus has greatly interested me. In general, we know too little of the origin of our cultivated plants, and therefore the information he gives is very welcome. He states that Messrs. Kelway and Son exhibited in 1912, for the first time, their Gladiolus primulinus hybrids in England; at the same time, Messrs. E. H. Krelage and Son brought their primulinus hybrids before the Committee of the Dutch Bulb Growers' Society, at Haarlem. The hybrids of both firms are thus of the same year.

Messrs. Krelage and Son bought, about 1910, from the late Max Leichtlin, some corms and seeds of crossings between Gladiolus primulinus and the larger-flowered Gladiolus. In my opinion Mr. Leichtlin crossed *G. primulinus* and Lemoinei-varieties, as his hybrids had thin, straight stems, and the characteristic hooded form of *G. primulinus*. The hybrids between *G. primulinus* and *G. gandavensis* have, on the whole, thicker stems and more open flowers while the flowers are set at a shorter distance on the stem.

In two years Messrs. Krelage had grown a fine collection of the first hybrids of Mr. Leichtlin, and as has been stated, in 1912, they were put before the Committee of the General Dutch Bulb Growers' Society, at Haarlem. After 1912, Messrs. Krelage made many crossings between *G. primulinus*, Lemoinei and nanceianus hybrids; between 1914 and 1922 no fewer than forty-five Gladiolus primulinus hybrids of Messrs. Krelage received Awards of Merit or First Class Certificates at Haarlem. Many of Krelage's hybrids are now grown in England, for instance: Eurydice, pale coral rose; Hermione, salmon-orange; Laetitia, orange-pink; Niobe, reddish orange; Salmonea, bright salmon-orange; and Scarletta, rich scarlet.

Another Dutch firm which raised many primulinus hybrids is Messrs. J. J. Grullemans and Sons, Lisse. Their hybrids are nearly as old as those of Messrs. Kelway and Messrs. Krelage. On the whole, Messrs. Grullemans' hybrids are larger-flowered, and include some fine sorts; for instance: Maiden's Blush, blush rose; Mrs. Grullemans, pure golden yellow; Orange Brilliant, brilliant orange-buff; Rose Luisante, rose; and Sunrise, salmon-rose.

The English- and the Dutch-raised primulinus hybrids form together first-class material for garden decoration and vases. *J. F. Ch. Dir, Heemstede, Holland.*

SOCIETIES.

NATIONAL ROSE.

JULY 1 AND 2.—For many years the Metropolitan summer show of the National Rose Society has been held in the Botanic Gardens, Regent's Park, but this year it was held in the grounds of the Royal Hospital, Chelsea. It was unfortunate that the change of venue should have coincided with such unfavourable weather conditions, for rain fell on the opening day to such an extent that the ground, both inside and outside the tents, became flooded with water long before the show was opened to the public, and after the visitors were admitted the conditions were unpleasant in the extreme. In spite of this, however, the show was a great success, for the quality of the blooms, considering the season, was exceptionally good, and the attendance very satisfactory. There was nothing very striking amongst the new varieties, but the Society's Gold Medal was awarded to two new seedlings, one of which has been seen on previous occasions. During the afternoon of the opening day the show was visited by Queen Mary, and another notable visitor was Princess Louise, Duchess of Argyll, who presided at the annual meeting of the Women's Farm and Garden Association.

AWARDS.

GOLD MEDALS.

Lady Forteviot.—In this large, broad-petalled Pernetiana variety, the dark, bronzy-green and shining foliage forms a fine setting for the brilliant orange-gold blooms. The flowers are scented and carried on stiff stems, so it should make a useful garden and bedding variety. Whether its very wide and not too plentiful petals will permit it to withstand wet weather without flopping and losing its orange tint remains to be seen. In regard to colour and robustness it is excellent. Shown by Messrs. BENJAMIN R. CANT AND SONS.

Everest.—A broad-petalled Hybrid Tea Rose of full exhibition size, but practically scentless. The big blooms contain an abundance of petals and should spread beautifully in kindly weather. The colour is clear creamy-white. Shown by Messrs. W. EASLEA AND SONS.

CERTIFICATES OF MERIT.

Elizabeth of York.—A charming Hybrid Tea Rose of lovely colour and pleasing form. It was exhibited as a garden variety, and should be first-rate for this purpose. It has not a sufficient number of petals to make it a successful exhibition variety, but, nevertheless, its colour will, no doubt, find it a place occasionally on exhibition boards. The petals are wide and roll back a little as the blooms open. The colour is bright, clear, soft orange-cerise, the outer petals fading a little to rose as the blooms become fully expanded. Grown on the Rosa laxa stock. Shown by Messrs. DOBBIE AND CO.

Bernice.—A strong-growing Rose apparently of suitable shape for exhibition and garden purposes. The growth is vigorous and the large, shapely blooms are borne on stiff stems. The wide-petalled blooms are a lovely shade of peach-pink with a glow of yellow which is given by the shading of the colour on the outside of the inner petals. This is a Hybrid Tea variety, but we could detect no fragrance in it. Shown by Mr. J. H. PEMBERTON.

Sunshine.—This is a very distinct, perpetual-flowering, dwarf, Polyantha Rose, with dark, neat foliage, excellent habit and freedom of flowering, many of the trusses carrying from a dozen to eighteen flowers. The colour is a pleasing shade of soft, orange-tinted yellow, very much the same shade as seen in the old Wm. Allen Richardson. Shown by Messrs. WM. CUTBUSH AND SON.

Chin Chin.—As a free-flowering, multiflora variety this should prove popular with growers. The habit is robust, and the single, light pink, pale gold centred flowers are daintily pretty. The blooms are borne on large, elegant sprays. The pale gold stamens add to the beauty of this variety. It is pretty in all but name, and we believe that the name has been used previously. Shown by Messrs. F. CANT AND CO.

OTHER NEW VARIETIES.

Golden Gleam.—A very bright, golden Pernetiana variety shown by Messrs. G. BECKWITH AND SON, was very attractive, and Billy Boy, from the same firm, appears to be exceptionally free-flowering and robust.

Bedford Crimson.—From Messrs. LAXTON BROS., arrested everyone's attention by reason of its strong and delicious fragrance.

Unique, fawny-orange, with light green foliage, shown by Mr. F. EVANS, Reading, appears to be of climbing or pillar habit, carrying its flowers singly on the side branches; it was exhibited as a hybrid, climbing Polyantha variety, and is certainly very distinct, especially as the calyx segments are deeply divided, almost suggesting Moss-Rose ancestry.

Messrs. CHAPLIN's variety named Waltham Cross is a bright, crimson-scarlet, semi-double Hybrid Tea Rose with very pleasing fragrance. The dark foliage and attractive colouring should make this a useful bedding variety.

Lily Kemp, very sweetly scented and of pretty shape in the bud, attracted our attention; the colour is orange tinted rose.

NURSERYMEN'S CLASSES.

Following the recent custom, the large trade groups of Roses were displayed on separate tables in the centre of a large tent. In this manner they made a most effective spectacle. Appropriately enough, the Championship group happened to be in the middle of the tent. There were three classes altogether for groups of Roses, so that the trade growers of different degrees might meet together in friendly competition, and the handsome group set up by Messrs. ALEX. DICKSON AND SONS was not only the finest in its class, but the best, irrespective of size, in all three classes, and well worthy of winning the Championship Trophy and the Edward Mawley Memorial Medal which was offered for the most meritorious exhibit in the Nurserymen's classes. It was a most pleasant arrangement of pillars and baskets of Roses of really good quality. In the centre of the group the chief varieties were Shot Silk, of delightful colouring, Betty Uprichard, Lady Hillingdon, Sunstar and Lady Inchiquin. The corner pillars were massed with fresh blooms of Paul's Scarlet Climber, Irish Elegance, Betty Uprichard and Lady Helen Maglona, while in the baskets there were Madame Edouard Herriott, Irish Fireflame, Red Letter Day, Lady Worthington Evans and Golden Emblem.

The second prize in this large group class was won by Messrs. CHAPLIN BROS., who displayed on their corner pillars beautiful blooms of Betty Uprichard, Madame Edouard Herriott, Shot Silk and Emma Wright. Amongst their well-filled baskets there was a beautiful arrangement of Mrs. Herbert Nash. Other varieties which helped to make this display attractive were Princess Elizabeth of Greece, Golden Emblem, Pearl White, Los Angeles and Ophelia. Messrs. B. R. CANT AND SONS were third in this important class, and their display was also composed of baskets, pillars and vases of good Roses. The chief varieties were Golden Emblem, Shot Silk, Lady Roundway, Gwyneth Jones, Lemon Pillar, Sunstar and Mabel Morse.

In this largest class of the show, attractive groups were also set up by Mr. ELISHA J. HICKS, Messrs. WATERER, SONS AND CRISP and Mr. J. H. PEMBERTON. Messrs. WATERER, SONS AND CRISP showed handsome vases of Shot Silk, K. of K., Mrs. Henry Morse, Hortulanus Budde, Los Angeles and Violet Stevenson, a new rich yellow Rose of considerable merit. The chief sorts displayed by Mr. HICKS were Betty, Mrs. H. Stevens, Lady Hillingdon, Clovelly, Maréchal Niel, and Joanna Bridge. Mr. J. H. PEMBERTON had an attractive group composed chiefly of his free-flowering varieties.

In the class for a medium-sized group of representative Roses the quality was equally as high as in the large class. The best group was arranged by Mr. GEORGE PRINCE, and his centre of Paul's Scarlet Climber surrounded by Betty Uprichard, Allan Chandler, Emma Wright, Lady Inchiquin and Golden Emblem was very effective. He also showed the fragrant Marcia Stanhope, Shot Silk and Mrs. Henry Morse in great beauty. Messrs. WALTER EASLEA

AND SONS, were second, and their centre was a basket of Betty Uprichard raised high, and surrounded by mounds of Madame Melaine Soupert, Hawlmark Crimson and James Valley. At the corners they had Madame Edouard Herriott, Henrietta, Lamia and Lady Pirrie. The third prize was won by Mr. JAMES MATTOCK with a well-arranged group of good garden Roses.

In the class for a group of Roses arranged on a table measuring six square feet, the first prize was won by Messrs. JARMAN AND CO. with a wholly admirable display. In the centre they had generously filled baskets of Phyllis Bide, General McArthur and Lieut. Chaure, while the corner pillars were massed with blooms of Mabel Morse, Ophelia, Cupid and Mrs. Henry Morse. Mr. GEORGE LILLEY, who was second, had a tall, central stand of Paul's Scarlet Climber, with lower pillars of Shot Silk, Betty Uprichard and Los Angeles. The varieties Lady Pirrie, Christine and Hortulanus Budde were also well shown. Mr. DAVID LONG was third.

The class for twenty-four distinct varieties shown in vases was intended to illustrate the foliage and habit of growth of each variety. Messrs. MORSE BROS. were decidedly first, and they had excellent vases of Admiration, The Queen Alexandra Rose, Shot Silk, Betty Uprichard, Lady Pirrie and Lord Charlemont. Mr. FRANK SPOONER was second, and his best varieties were Mabel Morse, The Queen Alexandra Rose, Madame Butterfly, Marcia Stanhope and Gorgeous. Mr. HENRY STREET, in his third prize exhibit, had good specimens of Betty Uprichard, Christine and Lamia.

Although the Roses in baskets were not so numerous as on most former occasions, the quality generally was very good. Only Mr. HENRY DREW exhibited seven baskets of decorative varieties, and he was awarded the first prize for a meritorious exhibit which included baskets of Betty Uprichard, Mrs. Courtney Page, Lady Inchiquin and Mrs. Henry Morse. Messrs. A. WARNER AND SON were first with three excellent baskets of decorative Roses, showing Hortulanus Budde, Mrs. Henry Morse and Golden Emblem. The three baskets of Polyantha varieties which won the first prize for Messrs. WM. CUTBUSH AND SON were beautifully coloured; the varieties were Locarno, Frank Leddy and Golden Salmon. Messrs. MORSE BROS. were second with well-flowered baskets of Redhatte, Gwyneth Jones and Lady Reading. Mr. ELISHA J. HICKS was third, and he had a fine basket of Glory of Hurst.

EXHIBITION ROSES.

Although the effects of the recent inclement weather were apparent in occasional damaged petals, they were fewer than might have been expected, and the quality generally of the exhibition Roses must have been gratifying to the Society. The Championship collection of exhibition Roses was set up by Messrs. B. R. CANT AND SONS, who won the coveted China Trophy. Their forty-eight distinct varieties included Mildred Grant, Mrs. Courtney Page, Lemon Pillar, Robert Hewitt, Edgar M. Burnett, Modesty, Nellie Parker and Colcestris. Messrs. FRANK CANT AND CO., who were second, had very fresh blooms of Edith Cavell, Lady Inchiquin, Mabel Morse, Courage, Rev. F. Page Roberts and Lord Charlemont. In their third prize exhibit, Messrs. G. LONGLEY AND SONS showed good blooms of Mrs. Henry Morse, Mildred Grant, Lemon Pillar and The General.

Messrs. JARMAN AND CO. followed their success in the group class by winning the first prize for twenty-four varieties with exceedingly good specimens of Mrs. Elisha Hicks, Edgar M. Burnett, H. V. Machin, Mrs. J. Laing, Lady Inchiquin and Candeur Lyonnaise. Second prizes were awarded to Mrs. ELISHA J. HICKS and to Mr. GEORGE PRINCE. The latter included beautiful blooms of Shot Silk, Frau Karl Druschki, Madame Jules Gravereux and Mabel Morse, while the best blooms of the former were George Dickson, the best bloom in the division; Capt. Kilbee Stewart, Earl Haig and Florence Forrester. Mr. HENRY DREW was third.

The collections of Tea and Noisette Roses were of better quality than might have been expected. Messrs. G. LONGLEY AND SON were first with a fresh collection of Auguste Comte, Madame Hoste, White Maman Cochet, Hugo

Roller and Constance Soupert. In Mr. HENRY DREW's second prize exhibit there was a highly-coloured bloom of Auguste Comte, and he also included the pink F. Von Marshall, Lady Plymouth, W. R. Smith and White Maman Cochet. Mr. GEORGE PRINCE was third, and his best varieties were Mrs. Ada Rothschild, White Maman Cochet and Molly Sharman Crawford.

The classes for Roses of recent introduction rarely contain blooms of outstanding merit, and the present show was no exception to the rule. The best twelve blooms of varieties distributed since the beginning of 1923 were shown by Mr. HENRY MATTOCK, whose finest blooms were Maud Cumming, Dr. A. J. Petyt, Betty Hulton and Gwynne Carr. Mr. E. HICKS was second, and his best specimens were Clovelly and Mrs. C. Edwards.

The twelve blooms of any one variety of new Rose were of better quality, and Messrs. B. CANT AND SONS were first with beautiful blooms of the fragrant Mrs. Beatty and Mr. ELISHA HICKS was second with the pink Clovelly. Frau Karl Druschki, shown by Messrs. JARMAN AND CO., was the best basket of H.P. Roses, and the same variety, shown by Mr. ELISHA HICKS was the second best. A handsome basket of Mrs. Henry Bowles, shown by Messrs. JARMAN AND CO., was the best of eight H.T. varieties, while Mrs. Henry Morse, set up by Messrs. G. LONGLEY AND SON was second. The Brayfort Challenge Cup was won by Messrs. MORSE BROS., who had a beautiful basket of Shot Silk. Messrs. A. WARNER AND SON were second with Lady Inchiquin of very good quality, and Mr. HENRY DREW was third with the same variety. The Nickerson Prize, which is offered for the best British or American Rose distributed between June 1, 1920, and the end of December, 1925, was won by a lovely stand of Shot Silk, shown by Messrs. A. WARNER AND SON. There were seven very good exhibits in the class, and the other varieties included Betty Uprichard, Mrs. Henry Morse, Rev. F. Page Roberts and Lady Roundway.

AMATEURS' CLASSES.

The Amateur rosarians fully upheld their high reputation at this show and, although some members were obliged to cancel their entries through storm damage to their blooms, there were many exhibits of considerable excellence.

The groups of representative Roses were admirable, and the Champion Trophy was won by G. W. HART, Esq., Potters Bar, with a wholly admirable collection of Roses which were of high quality and arranged with great taste. In the centre he had a magnificent basket of the richly coloured Etoile d'Hollande and also set up very meritorious vases of Mrs. Tresham Gilbey, Lady Inchiquin, Souvenir de Madame Bouillet, Shot Silk and Isobel. The second prize was won by Dr. R. C. TURNBULL, Colchester, also with a collection of good quality Roses. He included Isobel, of great beauty. W. E. BURGESS, Esq., was third in this important class. Only H. R. DARLINGTON, Esq., Potters Bar, exhibited a group of cut Roses on a space measuring four square feet, and he was awarded the first prize for a good collection of unnamed varieties.

There were many really good exhibits of Roses in baskets. The first prize for two baskets was awarded to T. N. BURGESS, Esq., who showed Mrs. Henry Morse and Lemon Pillar of high quality. W. E. MOORE, Esq., was first with one basket of Roses in the class for small growers. In the section for Amateurs who grow their Roses unaided, the best of many baskets of any one variety was that of Mrs. F. Gilbey, shown by H. ROBINS, Esq., Ingatestone, Essex, while W. A. NIGHTINGALE, Esq., Wallington, and A. H. FOWLER, Esq., Newbury, were similarly successful in the classes for those who grow limited numbers of plants.

Six competed in the class for twelve vases of distinct varieties, in which the "Mattock" Cup and £2 were offered as the first prize. It was an excellent contest and many beautiful Roses were shown. The first prize was won by Mr. G. MARRIOTT, Carlton, Nottinghamshire, with glorious blooms of K. of K., Los Angeles, Madame Edouard Herriott, Queen Alexandra, Golden Emblem, Hoosier Beauty and May

Marriott; second, Mr. R. H. LING, Berkhamsted, whose choicest varieties were K. of K., Betty Uprichard, Lamia, Madame Butterfly, and Vesuvius.

The Holroyd Cup was offered for six distinct varieties in vases, and it was won by Mr. A. L. F. COOK, Hayes, with a bright exhibit of such sorts as Sunstar, Lemon Pillar, Etoile d'Hollande and Emma Wright; second, Mr. R. H. LING.

In the class open only to growers within ten miles of Charing Cross, exhibitors from Finchley won the first and second prizes, Mr. E. HOLROYD and Mr. A. E. GRIFFITH, respectively. Mr. HOLROYD had good specimens of Emma Wright, Betty Uprichard, Los Angeles, Lady Pirrie, Madame Butterfly and Ivy May.

With grand vases of Mrs. E. J. Powell, Los Angeles, Moonlight and Col. Oswald Fitzgerald, Mr. H. ROBINS, Ingatestone, won the first prize in the class for six distinct varieties, open to those who grow their own Roses; second, Mrs. H. CRIBB. Mr. S. E. TATTERSHALL won the first prize in a similar class open only to those who grow fewer than 250 plants.

Mr. C. H. RIGG, St. Albans, won the Mawley Challenge Cup offered for twenty-four blooms, distinct. His blooms were shapely and well coloured, of such sorts as Mabel Morse, J. G. Glassford, Bessie Chaplin, Avoca, George Dickson and Earl Haig; second, Mr. F. H. FIELDGATE. Mr. RIGG also excelled in the class for two baskets of cut Roses with excellent blooms of Lady Inchiquin and Mrs. Henry Morse. Mr. W. E. MOORE, Ickenham, beat the Rev. F. BURNSIDE in the class for twelve blooms, distinct, in which the Lamplough Challenge Cup was offered. It was a splendid collection and the finest varieties were John Russell, Mabel Morse, Lord Charlemont, J. G. Glassford, Mrs. Henry Bowles and Candeur Lyonnaise.

A basket of Mrs. Henry Bowles, shown by Rev. F. R. BURNSIDE, Stambidge Rectory, Essex, was adjudged the best exhibit in Class 44. The Ben Cant Memorial prize, offered for twelve blooms, distinct, shown by growers of fewer than 500 Roses, was won by Mr. E. W. TURNER, Herne Bay.

ARTISTIC CLASSES.

A special tent was allotted to the various exhibits of decorated dinner tables, baskets of Roses, vases of Roses and bowls of Roses, arranged from an artistic point of view; the exhibits were sufficient to fill the available space and made a very attractive feature of the show. Three classes were included in the nurserymen's section, and eight in the Amateurs' division, the latter being open only to ladies. Whilst the exhibits generally were very meritorious, there was nothing strikingly original in arrangement and quality of material was often the deciding factor in making the awards. The range of varieties was not very wide, and the prizes were mostly awarded to exhibits of such Roses as Ophelia, Madame Butterfly, Roselandia and Richmond, which are popular market sorts for the cut flower trade.

Mrs. C. A. TISDALL, Woodford Green, excelled in the nurserymen's section for a dinner table decorated with cut Roses arranged with Rose foliage only. She had most glorious blooms of Roselandia arranged with beautiful sprays of Rose foliage, but we considered that the centre bowl was a trifle crowded. Mrs. A. BIDE, Farnham, was placed second for a decoration of the unique coloured I. Zangari, the petals of which are deep reddish-orange on a gold base, the under-surface being nearly all gold. The unopened buds are very dainty. Mrs. CHAPLIN contributed a charming exhibit in which Madame Butterfly Roses were used.

Mrs. TISDALL also excelled in the class for a bowl of cut Roses, with the variety Richmond, and she showed the best basket of Roses, lightly arranged with Rose foliage only.

In the amateurs' section, six competed in the class for a table decorated with single Roses, and Mrs. L. COLSTON-HALE, Warminster, was placed first for an arrangement consisting of two small centre bowls and four corner vases filled with Cupid and Irish Elegance in association. The effect was good, but even on the afternoon of the first day the individual flowers showed signs of deteriorating.

Mrs. OAKLEY-FISHER, Sunbury, utilised the

beautiful, deep apricot variety bearing her name to good effect, and was awarded the second prize, while Mrs. COURTNEY PAGE followed with an arrangement of Dainty Bess, a charming pink single Rose, but the clusters are rather heavy for a bowl; a little disbudding of the trusses would probably give better material for vases and bowls.

Mrs. COURTNEY PAGE excelled easily in the class for a table of Roses other than single, and her blooms were equal in quality to any in the show. The variety was Roselandia; the arrangement was bold and imposing—such beautiful flowers could not appear otherwise—and she employed just sufficient greenery to add grace and finish to the design. Second, Mrs. F. CHARLTON, Yiewsley, with an arrangement of Madame Butterfly Roses, the quality of which was of the highest merit; third, Mrs. A. D. RUFF, Sharnbrook, who also utilised Madame Butterfly.

The Nickerson Prize of a piece of plate valued at £10 was offered for a decorated dinner table, open only to amateurs who grow and stage their own flowers. This was a well contested class, but the blooms fell far short of the glorious quality of those in the preceding class, the source of which was not revealed. Miss E. GRIFFITHS, Finchley, won with a dainty arrangement of Betty Uprichard, a Rose of glorious colouring, and they were splendid specimens; second, Mrs. COURTNEY PAGE, with Emma Wright.

The best basket of cut Roses was shown by Mrs. COURTNEY PAGE, whose flowers of Madame Butterfly were of extraordinary fine quality; second Miss M. E. WEST, Reigate, with the variety Richmond.

Mrs. COURTNEY PAGE also excelled in the class for a bowl of mixed Roses in which seven competed.

Miss M. WOOLMAN is to be congratulated on her great success as a new competitor in these classes, for she showed the best basket of cut Roses, the basket provided by the Society; the best decorated dinner table in a class open only to those who have never won a first prize in this section; and the best bowl of cut Roses in a class with similar conditions. In each class her success was outstanding.

ROYAL HORTICULTURAL.

JULY 6.—When the arrangements were made it was hoped that Cherries would have been the special feature, but the season has been unfavourable, and it chanced that Delphiniums were the dominant feature of the show. Roses were also shown by several growers. The Clay Cup, which is offered for a Rose of good form and colour, not in commerce before the current year, and possessing the true old Rose scent, brought a number of sweetly-scented varieties. The Cup was awarded to the variety Abol, which was selected for trial at Wisley on June 25 last. Abol is a well-formed H.T., fully double variety, of milk-white colour, with a flesh-pink centre, and is deliciously scented. The variety was shown by the CHALK HILLS NURSERY CO. An interesting collection of fruiting Cherries in pots was shown by Messrs. GEORGE BUNYARD AND CO.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. S. Flory, Mr. A. Dye, Mr. Fred. Sander, Mr. H. G. Alexander, Mr. Charles H. Curtis, Mr. J. E. Shill, Mr. J. Cowan, Mr. Robert Paterson, Mr. T. Armstrong, and Mr. R. G. Thwaites.

AWARD OF MERIT.

Miltonia gatttonensis var. *Albatross* (Bleuana × *Charlesworthii*).—A very beautiful variety with large white flowers. At the base of each petal there is a tiny mauve stain, and on the lip, the dull yellow mask has three central red-brown radiating points. Shown by Messrs. CHARLESWORTH AND CO.

GROUPS.

MESSRS. CHARLESWORTH AND CO. contributed a very bright exhibit of about eighteen plants, and made a feature of *Miltonia gatttonensis*, *M. Lycaena*, *M. William Pitt*, *M. Venus*, *Cypripedium Solon* (*Rothschildianum* × *tonsum*)

Odontoglossum St. Mungo, *Odontioda* Patricia Ramsey and *O. Nesta* var. *maculata*, a handsome form with red-brown markings in the large, flat lip.

Cypripedium bellatulum was well shown by Messrs. SANDERS. *Vanda suavis* was also good, and other interesting subjects included *Coelogyne Massangeana*, with pendulous spikes, *Odontoglossum Insleayi aureum*, *Cypripedium niveum*, the yellow *Lycaste cruenta*, *Dendrobium infundibulum*, *Odontoglossum citrosum* and *Brassavola Digbyana*.

Messrs. STUART LOW AND CO. showed a fine-flowered specimen of *Cattleya gigas* and good examples of *L.-C. Aphrodite*, *Brasso-Laelio-Cattleya Burleigh* Bray, and some new *Odontiodas* as yet unnamed.

Messrs. H. G. ALEXANDER, LTD., exhibited a plant of *Laelio-Cattleya Queen Mary* var. *fulgens*, with three large, perfect, fragrant flowers of mauve-purple colouring, and ruby and purple lip. Messrs. BLACK AND FLORY showed *Miltonia Sanderiana* and *M. Kennie* var. *Princess Elizabeth* in which the deep chocolate-red mask almost covers the lip.

Cypripedium californica, a hardy, terrestrial Californian species, carrying five small, white flowers reminiscent of *C. Schlimii*, was shown by Mr. AMOS PERRY, Enfield, to whom the Committee awarded a vote of thanks for sending such an interesting plant.

Floral Committee.

Present: Section A.—Mr. H. B. May (in the chair), Mr. J. F. McLeod, Mr. H. J. Jones, Mr. William Howe, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mr. James B. Riding, Mr. A. E. Vasey, Mr. R. Findlay, Mr. D. Ingamells, Mr. J. T. West, Mr. W. B. Gingell, Major George Churcher, Mr. D. B. Crane, Mrs. Helen Lindsay-Smith, Mr. H. R. Darlington, Mr. Charles E. Pearson and Mr. W. D. Cartwright (Secretary).

Section B.—Mr. Gerald B. Loder (in the chair), Mr. James Hudson, Mr. G. Reuthe, Mr. Amos Perry, Mr. F. G. Preston, Mr. W. B. Cranfield, Mr. Reginald Cory, Mr. Mark Fenwick, Mr. C. Williams, Mr. T. Hay, Sir William Lawrence, Bt., Mr. E. H. Wilding, Mr. R. C. Notcutt, Mr. Charles T. Musgrave, Mr. E. A. Bowles, Mr. Clarence Elliott, Mr. N. K. Gould (Secretary), and Dr. Rendle and Mr. Coomber, Junr., (as visitors).

AWARDS OF MERIT.

Phlox argillacea.—This is stated to be a new species from Michigan. It is a dwarf, free-flowering plant, about eighteen inches in height. The leaves are quite small and narrow, and the plant bears spreading, branched heads of small, very pale lilac flowers which have darker tubes. Shown by Mr. T. HAY, Hyde Park, London.

Onosma Hookeri.—This is an attractive, dwarf "Borage." The whole plant, including the flowers, is furnished with harsh hairs. The leaves are long and narrow, and the tubular purple flowers are borne in branched cymes. Shown by Lt.-Col. MESSEL, Nymans, Sussex.

Mutisia retusa var. *glaberrima*.—The *Mutisias* are of doubtful hardiness, and we suspect that it is only in favoured gardens that the above variety can be grown. It is of climbing habit; the evergreen leaves are stout and undulated, stemless, and the apex is prolonged into a wiry tendril which twines around any convenient support. The large, Daisy-like flowers are three inches across and of pale blush colour, with a small cluster of purple and yellow stamens. Shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

Nuttallia cerasiformis.—This hardy, deciduous, Californian shrub is usually monoecious, and the award was given to exceptionally well-fruited branches of a female bush. It is one of the earliest of the hardy shrubs to flower and, although not very pronounced, the flowers have a very pleasant Almond-like fragrance. The oval fruits are pale yellow at first and become a dark plum-purple when ripe, when a well-fruited specimen is very attractive. Shown by the BOTANIC GARDEN, CAMBRIDGE.

Rose Everest.—(See National Rose Society's Awards, p. 36). Shown by Messrs. WALTER EASLEA AND SONS.

Delphinium Mrs. Foster Cunliffe.—A beautiful spike of large double flowers of delicate lavender colour with an occasional blue petal.

Delphinium Howard H. Crane.—Another handsome variety of blue and mauve colouring, with a white centre. Both varieties were shown by Messrs. BLACKMORE AND LANGDON.

Rose Atalanta.—A very attractive, free-flowering Rose which was obtained by crossing Paul Ploton, an old Wichuraiana variety, with William Allen Richardson. It has attractive, shining green foliage and bears good trusses of double flowers about three inches across. The flowers are pale salmon in colour when first open, and change to a pretty pale pink blush. It is a pleasantly fragrant variety suitable for training against a pillar or for growing as a weeping standard. Raised and shown by Dr. A. K. WILLIAMS.

Begonia Mrs. Ward.—A magnificent double flowered, tuberous-rooted variety with handsome foliage. The very large, perfectly double flowers have broad, substantial petals of bright pink colour.

Begonia Sir Philip Sassoon.—This is a fitting companion to the foregoing, and it also has handsome leaves. The flowers are of vivid crimson colour, and the petals are waved and lightly serrated. Both were shown by Messrs. BLACKMORE AND LANGDON.

For Trial at Wisley.

Delphinium Rosetta.—This appears to be a useful garden variety. The single flowers are rather loosely arranged and of bright blue colour, margined with mauve. Shown by H. G. RAYMENT, Esq., Arcadia, Harpenden.

GROUPS.

Several large exhibits of *Delphiniums* made an imposing display. Messrs. BLACKMORE AND LANGDON again brought most magnificent spikes which they set up admirably. On this occasion they included several of their novelties, such as *Lady Augusta*, a rich blue self with a black and gold eye; *Lady Edith*, a robust and stately spike of very large, semi-double lavender flowers with a dark eye; and the two varieties, which received Awards of Merit. Messrs. HEWITTS, LTD., staged good spikes of *The Shah*, *Mrs. Townley Parker*, *Monarch of Wales*, *Lorenzo de Medici* and *The Alake*.

In his attractive collection, Mr. T. CARLILE had tall spikes of *G. Cochrane*, *Blue Boy*, *Prince Gustav* and *Lord Derby*, and also used many vases of excellent *Gaillardias*. Mr. T. BONES had a large group of *Delphiniums* in which he displayed several of his good seedlings with *Lord Derby*, *Clarissa*, sky-blue, *Star of Langport*, pale blue, *Rev. Charles Storr*, a medium shade of blue, and *The Alake*. Messrs. G. AND A. CLARK showed hardy border flowers in variety, including *Delphiniums*. *Scabious* and *Malva moschata*. Messrs. M. PRICHARD AND SONS set up a good miscellaneous collection of hardy flowers and alpine. They had vases of *Iris Kaempferi* varieties, *Gladiolus Colvillei*, *Verbascum Wiedmannianum*, *Sempervivums* and *Mesembryanthemums*. Some pretty *Mesembryanthemums* were planted by Messrs. L. R. RUSSELL, LTD., in a rock garden exhibit. They had *M. Brownii* and *M. turbinata rosea* and also displayed *Oenothera riparia* and *O. speciosa*.

A long stretch of tabling was filled by Mr. F. G. WOOD with a skilfully arranged collection of border flowers and alpine. He included several very attractive varieties of *Mimulus* and dwarf *Campanulas*, *Verbena venosa*, *Primulas*, *Nierembergias* and *Digitalis aurea*. The Misses HOPKINS grouped Sweet Williams, *Alstroemerias*, *Lychnis chalcedonica* and *Violas*.

Mr. AMOS PERRY had a valuable exhibit of uncommon bog and border plants. He showed *Lilium Hansonii*, *L. Parryi*, *Brodiaea laxa*, several good varieties of *Isia*, *Calochortus*, *Iris aurea*, *I. Monnieri*, *Tritomas* and *Sparaxis*. Messrs. TUCKERS, LTD., had a rock garden planted with dwarf *Campanulas*, *Genista tinctoria* fl. pl., *Oenothera riparia* and other appropriate plants. On a large table space, Messrs. B. LADHAMS, LTD., displayed large masses of *Coreopsis imbricata*, *Erigerons*, *Lavatera Olbia*, *Campanulas*, *Alstroemeria haemantha*, *B. Ladhams* and *Iris laevigata* varieties.

Just inside the entrance, Messrs. WATERER, SONS AND CRISP had a superb exhibit of Japanese Irises arranged in front of an appropriate background of Bamboos and *Astilbe Aruncus*. The Irises included such good varieties as *Mrs. Stanley*, *Olympus*, *Helena*, *Attraction*, *Jupiter* and *Adonis*.

Roses of good quality were shown by several growers. Messrs. FRANK CANT AND CO. included vases of *Golden Emblem*, *Mrs. Henry Morse*, *Madame Edouard Herriot* and *Madame Butterfly*. Several stands of their fragrant Bedford Crimson were shown by Messrs. LAXTON BROS. W. F. Dreer, *Mrs. Henry Morse*, *Pax* and *Vanity* were the chief varieties staged by Mr. J. H. PEMBERTON. Messrs. A. WARNER AND SON had vases of *Hortulanus Budde*, *Los Angeles*, *Lady Inchiquin* and *Betty Uprichard*.

In their exhibit of Roses, Messrs. B. R. CANT AND SONS staged *Etoile d'Hollande*, *Lord Charlemont*, *Betty Uprichard*, and the large, single, yellow *Cecil*. Messrs. WALTER EASLEA AND SONS gave the central place to a large vase of their new variety *Everest*, and also showed *Angele Pernet*, *Mrs. Drew* and *Mrs. Henry Morse*. Messrs. W. E. B. ARCHER AND DAUGHTER set up goodly vases of the pretty *Dainty Bess*, with *Emily Grey* and *Joyous Cavalier*. In their collection, Messrs. HARKNESS AND SONS showed *Nellie Parker*, *Lord Charlemont*, *Gwynneth Jones*, *Lamia* and *Mabel Morse*. Mr. GEORGE LILLEY staged good vases of *Miss May Marriott*, *Madame Edouard Herriot* and *Golden Emblem*.

Messrs. GEORGE BUNYARD AND CO. again showed a delightful collection of the old-fashioned Roses, and included the common *Moss*, *Gloire de Mousseuses*, *Rosa Gallica* and the *Cabbage Rose*. Messrs. D. PRIOR AND SONS had vases of *Frank Reader*, *Jack Hobbs* and *Golden Butterfly*. Messrs. C. ENGELMANN, LTD., set up a fine collection of greenhouse Carnations, amongst which there were vases of *White Enchantress*, *Orange Sunstar*, *Maine Sunshine* and *Dorcas*.

Fruit and Vegetable Committee.

Present: C. G. A. Nix, Esq. (in the chair), Mr. J. Cheal, Mr. P. C. M. Veitch, Mr. G. F. Tinley, Mr. A. Poupart, Mr. W. H. Divers, Mr. J. Harrison, Mr. E. Beckett, Mr. E. Neal and Mr. A. N. Rawes (Secretary).

Messrs. G. BUNYARD AND CO. exhibited a collection of Cherry trees in pots, including the varieties *Napoleon Bigarreau*, *Act Gillos*, a small, pale variety from Italy; *Frogmore Bigarreau*, *Belle de Montreuil*, *Tradescant's Heart*, *Hâtive de Balis*, a small, black Cherry; *Early Amber*, *Elton Bigarreau*, *Précoce de Boppard*, a fine, big, black variety; *Kentish Bigarreau*, *Ochsenherzkirsche*, another black sort from Germany; *Gr. Prinzessin*, very free and of large size; *Black Tartarian* (of Rivers), *Florence*, *Di Nizza*, very large and somewhat like *Napoleon Bigarreau*, and *Schwarze Knorpel*, another excellent black Cherry. Mr. J. J. KETTLE showed *Raspberries Lord Lambourne*, a yellow variety, and *Lloyd George*.

Messrs. LAXTON BROTHERS staged *Black Currants Blacksmith*, *The Raven* and *Black Grape*; *Red Currants Laxton No. 1*; *Gooseberries Emerald* and *Bedford Yellow*; and *Raspberries Bountiful*, *Yellow Hammer* and *Renown*.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE eighty-second anniversary festival dinner of the Gardeners' Royal Benevolent Institution was held on Wednesday, June 29, in the New Princes' Galleries, Piccadilly. Major-General the Lord Treowen, C.B., C.M.G., occupied the chair, and he was supported by many distinguished horticulturists. As usual at these functions, the floral decorations were exceedingly beautiful, and a programme of vocal and instrumental music, rendered under the direction of Mr. Ralph Norris, contributed to the enjoyment of the evening.

After the usual loyal toasts had been duly given and received, the Chairman proposed the principal toast of the evening—that of the Gardeners' Royal Benevolent Institution—

and he associated with it the name of Mr. Leonard Sutton, Chairman of the Committee. The name of Sutton, said His Lordship, was known all over the world as contributing to an abundant harvest, and he hoped they would have an abundant harvest that evening. He said they had assembled to do their utmost to ensure the continued prosperity and extension of an admirable Institution. The love of gardens was general and all those who loved a garden had a tender spot for the men who were concerned in its making and upkeep. In recent years, owners of gardens found a difficulty in employing as many gardeners as before the war, but he hoped they would not reduce their staffs, for this would increase the difficulties of the Institution, as, doubtless, the older employees would be the first to go. Lord Treowen said that the first industry of the world begat others, including agriculture, viticulture and floriculture. Gardening was also responsible for the institution of the Royal Horticultural Society, the genial President of which he was pleased to see with them that evening. He heartily congratulated Lord Lambourne on the recent honour bestowed upon him by the King, and everyone would agree that the blue ribbon he wore so well was a worthy symbol of a blameless life. Flowers, said Lord Treowen, brighten our homes, cheer the weary hours of the sick and deck our last resting place. The love of flowers is a primitive instinct of Nature which unites us all. The great Francis Bacon said that a garden could not be well under thirty acres, but we live in an age when the humblest person may possess one. His Lordship then referred to the several funds of the Institution, such as the Victorian Era Fund, the Good Samaritan Fund, and the George Monro Memorial Fund, which, together with the payment of the pensions, involves an expenditure of £5,500 a year, although the assured income is only £1,200. It is, he said, to these festival dinners the Committee looks to make up the deficiency, and he asked all present to give as liberally as they could. He added to the toast the name of Mr. Leonard Sutton, and that of the Secretary, Mr. George Ingram.

Mr. Leonard Sutton said it was a great privilege to respond to the toast. He greatly appreciated how much the Committee was indebted to His Lordship for taking the chair that evening, for he had advanced the claims of the fund in an able manner; he was glad that he had mentioned the name of their Secretary, and wished that Mr. Ingram could reply to the toast instead of himself, for then they would have had an appeal, such as their late Treasurer, Sir Harry Veitch, used to make. The Institution, said Mr. Sutton, had two-hundred-and-fifty pensioners and is doing a vast amount of good. One way in which help could be forthcoming was by having collection boxes in gardens. He asked all connected with gardens, and especially the trade, to give the Institution their heartiest support.

The toast of "The Visitors" was proposed by Sir John Smith Young, C.V.O., Master of the Worshipful Company of Gardeners. He said he was glad to be present to continue the time-honoured association of the Worshipful Company of Gardeners with the Institution, and he extended a hearty vote of welcome to the visitors.

The toast of "The Chairman" was proposed by Lord Lambourne, who said that he had determined to spare no effort to be present to support His Lordship, for of all the distinguished men who had occupied the chair at these dinners none had more sympathy with the Institution than Lord Treowen.

At this stage of the proceedings the Secretary announced that £2,450 had been collected at and in consequence of the dinner, including £105 from the Chairman; £105 from Messrs. Rothschild and Sons, £105 from Messrs. Sutton and Sons, £100 each from Messrs. Hurst and Son, Messrs. W. Wood and Son and Messrs. Bentley and Co.; £90 from Mr. Charles H. Cook; £52 10s. 0d. each from the Royal Horticultural Society and Messrs. Waterer, Sons and Crisp; £50 from Messrs. Corry and Co.; £38 from Mr. R. W. Wallace; £30 from Mr. Charles H. Curtis, including £10 10s. 0d. from Mr. Laurence Bradbury; £25 from Major Churcher; £22 from Mr. W. Honess; £21 from Mr. H. G. Alex-

ander; £17 17s. 0d. each from Mr. Bernard Crisp and Mr. T. Finch; £15 15s. 0d. from Mr. F. A. Secrett; £15 from Mr. T. H. Cook; £15 from Mr. F. Walton; £12 12s. 0d. from Mr. F. J. Chittenden; £10 10s. 0d. each from Col. Sir J. Smith Young, Mr. Peter Veitch, Miss Mildred Veitch, Mr. E. Beckett, Messrs. Bunyard and Co., Mr. W. Duncan Tucker, Mr. W. Cuthbertson, Mr. H. Dunnett, Messrs. Protheroe and Morris, Mr. E. Harriss, Mr. J. Cull, Mr. M. Larsen, Messrs. Barr and Sons, Mr. Arthur Dye, Mr. S. M. Segar, Mr. George Cobley, and Mr. J. L. Kinnell; £7 7s. 0d. from Mr. Raymond Rochford; £6 6s. 0d. each from Mr. W. Turner, Mr. R. Bates and Mr. H. W. Nutting; £5 5s. 0d. each from Messrs. Lowe and Shawyer, Messrs. Bees, Mr. A. Dimmock, Mr. G. Prickett, Mr. W. H. Cutbush, Mr. S. J. Martin, Mr. E. F. Hazelton, Mr. J. M. Bridgeford, Mr. J. F. McLeod, Mr. A. Howard, Mr. A. Dawkins, Mr. A. Bedford, Mr. F. Ridley, Mr. H. Hicks, Mr. E. T. Willis, Messrs. Charlesworth and Co. and Mr. J. Barker. Major E. G. Monro's Covent Garden list included £25 from Major Monro, £25 from Mr. George Monro; £10 10s. 0d. each from Messrs. G. Monro, Ltd., Mr. A. Watkins, Mrs. A. Watkins, Messrs. E. Stevens, Messrs. A. Stevens, Messrs. T. J. Poupart and Mr. J. P. Rochford; £5 5s. 0d. each from Messrs. T. Rochford and Sons, Mr. G. M. Rochford, Messrs. E. Rochford, Mr. Bert J. Monro and Mr. A. Baker. Mr. David Ingamells and Mr. John Collingridge's Covent Garden list amounted to £240, and included the following amounts: £10 10s. 0d. each from Mr. David Ingamells, Mr. J. Collingridge, Messrs. Parsons and Co., Mr. Harry Miles and Messrs. Slaymaker and Co.; £7 7s. 0d. from Messrs. Forster and Robins; £5 5s. 0d. each from Mr. G. Bambridge, Mr. O. Hiehle, Mr. W. O. Hiehle, Mr. J. Linford, Mr. Bruce L. Gibson, Mr. H. Chapman, Mr. W. Chapman, Mr. W. Maxwell and Mr. A. Maxwell.

SCOTTISH PANSY AND VIOLA.

FOLLOWING on the unfavourable weather experienced during the past three months, the exhibits of new Pansies and Violas were not so numerous as in former years at the first meeting of the above Association held in Glasgow on the 2nd inst. The awards were as follows: Pansies: Dan Cochrane, raised by Mr. ALEXANDER COCHRANE, Fauldhouse, First Class Certificate; Bill Smith, raised by Mr. T. W. WILSON, Neilston, Certificate of Merit. Violas: Jean Lister, raised by Messrs. ALEXANDER LISTER AND SONS, Rothesay, First Class Certificate; Mrs. George Gibb, raised by Mr. QUINTIN McFADYEAN, Carlisle; David Stevens on, raised by Mr. D. STEVENSON, Barrhead; and Mrs. John Douglas, raised by Mr. JOHN DOUGLAS, Uphall, Certificates of Merit.

The outstanding novelty was Viola Jean Lister which was declared to be one of the finest Violas ever shown. The colour is white edged with heliotrope-blue, and is considered to be an improvement on Mrs. James Scalley. Its chief qualities are large size, good form, smoothness of petal and clear eye. Dan Cochrane, which was also awarded a First Class Certificate, on the previous Saturday, by the West Lothian Society, is the largest Pansy that has been shown in Glasgow; each flower measures four inches across. The lower part has dense black blotches with an edging of cream, while the upper part is violet edged with cream.

MORAY FIELD CLUB.

THE latest excursion of members of this Club was to the beautiful gardens and woods of Blackhills, Morayshire. Some fifty members took part, and the day was exceedingly fine. Mr. T. North Christie and his sisters conducted the members through the gardens and policies.

The gardens at Blackhills contain many rare species of Rhododendrons, and comparisons were made by some of the members with the celebrated Rhododendron Gardens near Birkenhead, but it was agreed that although much farther north, Blackhills can boast a collection as diversified, as gorgeous and as rare as that to be seen at Birkenhead or anywhere else in this country. Great admiration was expressed for the fine specimens of *R. ochroleucum*, *R.*

sinogrande, *R. Royalei*, *R. argenteum*, *R. Falconeri*, *R. yunnanense*, *R. Loder's White*, *R. decorum* and *R. campylocarpum*. The woods of Blackhills are famed for their fine Pines, Sitka Spruces, Copper Beeches and graceful Birches. At the time of the visit everything was looking its very best, the mossy green carpeting, the wild blue Hyacinths, and the pink *Claytonia siberica* making a picture that will not soon be forgotten. The members were entertained to tea by Mr. Christie and the Misses Christie. The President of the Club, Rev. George Birnie, thanked his hosts for the enjoyment and pleasure the members had derived from their visit to Blackhills.

GENERAL BULB GROWERS' OF HAARLEM (HOLLAND).

THE various Floral Committees have awarded the following Certificates to Tulips and Daffodils during their spring sessions, 1927.

FIRST CLASS CERTIFICATES.

Narcissus (Incomparabilis) Fortune.—Sulphur-yellow, big cup, orange-coloured changing to orange-red. From seeds, by Mr. WALTER T. WARE, Bath, England.

Narcissus (Incomparabilis) Prince of Orange.—White perianth, long, tall cup orange-red. From seeds by Messrs. de GRAAF BROS., and S. A. V. KONIJNENBURG AND CO., Noordwijk.

Narcissus (Poetaz) Red Guard.—Apricot-coloured perianth, with small orange cup.

Breeder Tulip St. James.—Dark Bordeaux-red with copper-coloured border.

AWARDS OF MERIT.

Narcissus (Barrii) Carolina.—Clear, pure white; frilled cup with dark orange border. From seeds, by Messrs. WARNAAR AND CO., LTD., Sassenheim.

Narcissus (Barrii) Kilter.—Creamy-white perianth with orange-red cup. Imported from England.

Narcissus (Barrii) Mr. Dix.—Creamy-white perianth, frilled cup, self-coloured orange.

Narcissus (Barrii) Tilla Durieux.—Pure white perianth, small cup with frilled, deep-red border.

Narcissus (bicolor) Progression.—Trumpet golden-yellow, widely-opened; perianth, soft sulphur-yellow. From seeds, by Messrs. L. VAN LEEUWEN AND SON, LTD., Sassenheim.

Narcissus (Hermani) Martha Washington.—Sulphur-white with orange cup. The Narcissi Hermani, are "giant" poetaz-Narcissi. As a rule, there are three flowers on a stem.

Narcissus (Incomparabilis) Agra.—Large, soft, sulphur-yellow perianth with deep, orange, widely-opened cup. Imported from England.

Narcissus (Incomparabilis) Irma.—Perianth sulphur-yellow, somewhat reflexed, with very clear and striking orange cup. Imported from England.

Narcissus (Incomparabilis) Jacqueline.—Clear, white perianth, with pure, deep orange cup, beautifully frilled.

Narcissus (Incomparabilis) Leviathan.—Sulphur-yellow perianth, very large; flat, spotted cup.

Narcissus (Incomparabilis) Mrs. George Chandler.—Perianth butter-yellow, non-closed, somewhat reflexed; cup large, widely opened, orange-yellow; strongly frilled, trumpet-shape.

Narcissus (Incomparabilis) Orange Beauty.—Very dark, golden-yellow perianth, orange cup, long, trumpet-shape, strongly frilled. Imported from England.

Narcissus (Incomparabilis) Princess Astrid.—Clear butter-yellow perianth, tall, orange cup.

Narcissus (Incomparabilis) Red Excelsior.—Yellow perianth, folded; large, clear orange-coloured cup.

Narcissus (Incomparabilis) Red Glory.—Widely-spread perianth, with trumpet-shaped cup.

Narcissus (Incomparabilis) Sophia.—White, well-closed perianth, round petals, flat cup, orange yellow, frilled.

Narcissus (Leedsii) Miramare.—Tall giant Leedsii, pure white perianth and creamy white cup. From seeds, by Messrs. E. H. KRELAGE AND SON, Haarlem.

Narcissus (Poetaz) Scarlet Gem.—Lemon-yellow perianth, clear orange cup. Imported from England.

Narcissus (Poeticus) Dulcimer.—White, well-closed perianth with very flat cup, orange-bordered, interior changing to yellow. Imported from England.

Narcissus (Poeticus) Ringdove.—White, round perianth, with small, yellow, orange-bordered cup. Imported from England.

Narcissus (Poeticus) Sarchedon.—Clear white, well-formed perianth, a rather flatter cup than that of Actaea. Shown by Messrs. WARNAAR AND CO., LTD., Sassenheim, and Mr. H. VAN DER WILDEN, Sassenheim.

Narcissus (Poeticus) Snow King.—Large, white perianth, vivid cup with red border.

Narcissus (white Trumpet) Ada Finch.—Sulphur-yellow trumpet upon a paper-white, pointed perianth; large trumpet, strongly frilled.

Narcissus (white Trumpet) Virginia.—White perianth, creamy-yellow trumpet, frilled border, a little apricot colour.

Double Narcissus Sycorax.—Soft yellow, compact flower with clear orange.

Double Narcissus Valencia.—Large, double flower, like a Rose; clear yellow with orange. From seeds, by Messrs. DE GRAAFF BROS., and S. A. VAN KONIJNENBURG AND CO., LTD., Noordwijk.

Darwin Tulip, Golden Beauty.—Self-coloured golden-yellow with black stamens. From seeds, by the late Mr. N. DAMES.

Darwin Tulip White Giant.—Vigorous, white flower, black stamens. From seeds, by Messrs. J. J. GRULLEMANS AND SONS, LTD., Lisse.

Mendel Tulip Caesar.—Deep scarlet-red with yellow centre. A cross between Duc V. Tholl and William Pitt. By Messrs. E. H. KRELAGE AND SON, Haarlem.

Mendel Tulip Brilliancy.—Fiery red with soft blue on a white base.

Single early Tulip Mathilda.—Soft satin-pink on white base; stout plant. Seedling of the late Polman Mooy.

Single late Tulip Aviso.—Vivid salmon-pink with soft coloured border. From seeds, by Messrs. E. H. KRELAGE AND SON, Haarlem.

Single late Tulip Hera.—Satin-rose, soft pink margin. From seeds, by Messrs. E. H. KRELAGE AND SON, Haarlem.

Single late Tulip Mayflower.—Soft satin-pink orange shaded and violet on the outside, blue centre. From seeds, by Messrs. C. G. VAN TUBERGEN, JR., Haarlem.

Single late Tulip Pink Lady.—Pink with violet shade; long, sturdy flower on a stout stem.

Single late Tulip Scarletta.—Vermilion red on a creamy-white base.

Lily-flowered Tulip White Duchess.—A long, neatly shaped white flower, with white stamens. From seeds, by Messrs. E. H. KRELAGE AND SONS, Haarlem.

Obituary.

William P. Lasham.—We have but recently learned of the death of this well-known Potato expert, for many years head of the Potato Department of Messrs. Sutton and Sons, and an employee of the firm for fifty years. His knowledge of the Potato and its cultivation was probably unsurpassed by anyone in this country, and he was a member of several committees of societies dealing with the Potato. He died at Reading on June 11, aged 65 years. Mr. Lasham was a man of kindly nature and greatly esteemed by all who knew him. The funeral was attended by Mr. Leonard Sutton, Mr. M. H. S. Sutton and numerous colleagues from the firm. He was a prominent freemason. The numerous floral tributes included wreaths from the heads of Messrs. Sutton and Sons, from several of the departments of the firm and from the local freemasons.

Karl Schöne.—The German horticultural papers record the death of Karl Schöne, the doyen of German Dahlia raisers. Schöne was not, like so many horticultural specialists, devoted to his occupation from his earliest years. Although always fond of gardening, and even as a child so clever at Rose growing as to make quite a nice sum of pocket money in this way, he chose the career of an artist, and taught drawing, using only his spare time in horticultural pursuit. It was the firms of Otto Mann that first recognised the value of his hybridising work, and it was through this firm that his first notable Dahlia—Goldkind—was put into commerce. While he remained an amateur many difficulties were placed in his way, but eventually the establishment of the Leipzig trial grounds of the German Dahlia Society, of which he was asked to become manager, cleared the way for him to abandon his profession and devote himself entirely to Dahlia raising. His finest achievement was the raising of the "Water-Lily" type, of which Aureola was the first example, and Goldrose and Farbenkönigin the best known varieties. He was also a pioneer in the dwarf type, and some of his most popular varieties were Goldene Sonne and Andreas Hofer, which were an immediate success as market cut flowers. He was sixty-nine years old at the time of his death, and had occupied a position, in spite of his long maintained "amateur" status, such as few professional raisers expect to attain.

ANSWERS TO CORRESPONDENTS.

BARK OF APPLE TREE SPLITTING.—S. W. R. There is nothing about the piece of bark sent for examination to give an indication of the cause of the bark splitting, and the whole tree having a scorched appearance. The description suggests that the tree may have been struck by lightning. There is a possibility, however, that there is something wrong with the roots. This could soon be ascertained by uncovering and examining a few of the roots.

CANTERBURY BELL.—R. W. G. The occurrence of a double cup in the Cup and Saucer Canterbury Bells is quite common.

CUCUMBER FRUITS FAILING.—J. A. B. and A. E. L. The Cucumber fruits sent for examination are not suffering from an infectious disease. Their failure to develop is caused by the weak constitution of the plants. Even young, healthy Cucumber plants produce more fruits than they can bring to maturity, and a certain proportion of them wither and die when quite small. If the plants are out of condition a large number of fruits may be affected. The disorder may usually be traced to the roots, and the first step towards recovery must depend upon an improved root action. Your best plan is to open the ventilators of the houses and dry out the beds for a week, maintaining the plants by judicious overhead damping. The fire heat must, of course, be kept going. This treatment hardens the plants and allows the roots to make fresh growth. At the end of the week you should close down the houses, top-dress the beds with an inch of clean, virgin soil, and then apply a dressing of dried blood at the rate of two ounces per square yard. A week later the beds may be mulched with stable manure and normal treatment may be carried out from that day.

NAMES OF PLANTS.—A. W. R. Material insufficient for correct determination. *Iris*. 1, *Iris sibirica*; 2, rotted; the contents of the box were much too damp. *M. A. A. Centranthus ruber*. *Wadworth*. *Buddleia globosa*. *H. L. Muscari comosum monstrosum*. *C. C. M. Rubus deliciosus*. *E. B. A. 1, Genista virgata*; 2, a congested form of *Delphinium grandiflorum*; 3, *Thymus odoratissimus*; 4, *Veronica buxifolia*; 5, *V. propinqua*; 6, *V. Hecori*; 7, *V. speciosa* variety.

PEACH SHOOTS DISCOLOURED.—T. T., Norwich. The discoloured areas on the young shoots of Peaches have been attributed to a botrytis disease. All twigs showing the dark lesions should be cut out when pruning the trees in winter, and spray the trees now with a rose-red solution of permanganate of potash.

PEARS AND PLUMS DROPPING.—A. In explanation of your Plums and Pears dropping every year, the condition of the trees is at fault. Perhaps they are too vigorous, and with age they may become more fruitful. Or it may be that these particular varieties cannot be grown successfully in your garden. Such cases are not rare. The Pears look as if they had been touched by frost; so possibly they might have remained on the tree this year had the weather been more favourable.

PEARS AND PEACHES DISEASED.—A. H. B. The Pear-leaf Blister Mite is responsible for the diseased appearance of the Pear foliage. Spraying with lime-sulphur at winter strength before the buds are too far advanced, say in February, is said to be a remedy. The other specimen is Peach-leaf Curl, a common fungous disease. If blistered leaves are not very numerous, it would be well to cut off the affected shoots or leaves and burn them. In any case, spray the trees next season, just before the buds begin to swell in February, with strong Burgundy mixture made from the following ingredients: Copper sulphate, 2½ lbs.; carbonate of soda (crystals), 2½ lbs.; water 12 gallons. Dissolve the copper sulphate in the bulk of the water, but keep two or three gallons in which to dissolve the soda. Mix the two solutions when about to use the spray.

TOMATOS DISEASED.—H. W. M. Your Tomato leaves are suffering from a disease known to Tomato growers as Mildew, which is caused by the fungus *Cladosporium fulvum*. No absolute cure for this disease is known, but it may be kept under reasonable control by thoroughly ventilating the houses and keeping up the temperature at night. Your object should be to maintain a dry atmosphere and thorough circulation of the air around each plant. Either dusting with sulphur powders or vaporising sulphur in the houses will help to retard the progress of the disease.

TOMATOS FAILING.—A. M. The Tomato plant sent is suffering from "Sleepy" disease caused by *Verticillium albo-atrum*. This fungus lives in the soil and, after entering the root, passes up the wood vessels, turning them a reddish-brown colour from the base to within a few inches of the growing point. This disease is caused by low temperatures, and usually does not occur at this time of the year. Its persistence seems to be due to the low night temperatures which prevail. Wilted plants recover at high temperatures, and you should keep your night temperatures as high as possible. If a large proportion of the plants is infected, a light shading on the glass will help them to recover. The wilted plants should be damped overhead, and very little water should be given to the roots. To prevent this disease occurring another year you should sterilise your soil by means of steam.

VIOLAS DYING.—A. S. A. The stems of the dying Viola plants contain the resting spores of a fungus. Your only course is to dig up the affected plants and destroy them by burning. You would be advised to plant fresh stock in another part of the garden, as far from the old ground as possible.

WOOD LICE AMONG ORCHID ROOTS.—E. K. Your best plan is to introduce a few toads into your Orchid houses and they will soon clear them of wood lice.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 63.1°.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 13, 10 a.m. Bar. 31.5. Temp. 60°. Weather, Overcast.

Fertility in the Genus Brassica.

THE raiser of seeds has learned, by long experience and acute observation, to become skilful in his difficult and important craft, and as a result he is generally able to supply us with seed of a high standard of purity. The difficulties which beset the successful discharge of this task are illustrated strikingly in Mr. Alex. Nelson's article on Fertility in the Genus Brassica in the current number of the *Journal of Genetics*.* Mr. Nelson has made a most valuable survey of the state of fertility which exists in the large and economically important genus Brassica. This genus he regards as being composed of three sections, the Cole group, including the Cabbage and its allies; the Turnip, Swede, and Rape group, and the Mustards. His careful experimental work adds considerably to the valuable pioneer discoveries of the late Mr. Arthur Sutton. The genus Brassica shows a wide range of fertility. The Coles—forms of Brassica oleracea—which include Cabbages, Savoy, Brussels Sprouts, Broccoli, Kohl

Rabi, etc., are self sterile. All the seeds which they set are due to pollen from other plants of like kind. There is, moreover, a considerable amount of inter-fertility between members of this group; Savoy pollen, for example, may provoke seed-formation in the Cabbage and vice versa. This is in accordance with the results of similar investigations made by Charles Darwin, and cited in his work on *The Effects of Cross- and Self-fertilisation in the Vegetable Kingdom*. Thus Darwin found that purple-green-leaved and white-green lacinated-leaved Cabbage planted together gave rise to a mongrel progeny of 325 seedlings from the purple-green variety of which 165 had white-green and 160 purple-green leaves. A similar mongrel offspring was provided by the white-green variety. It follows, therefore, that to keep varieties of Coles true to type great care has to be taken to grow each of them in effective isolation from any of the others of the group. Mr. Nelson shows, however, that the Coles may be divided into two sub-sections. It is the Cabbages, Savoy and their allies which constitute the self-sterile sub-section. Kohl Rabi and Sprouting Broccoli are self-fertile, although their self-fertility may be low; that is, though a given plant does set seeds when it is prevented from being pollinated by others of its kind, the number of seeds which it sets is small. The same need for isolation applies, however, for no good seedsman will tolerate avoidable rogues in the strains he puts on the market. Self-fertility obtains also in the Turnip, Swede, and Rape group, although the degree of self-fertility varies; Turnip and Rape exhibiting it less than does the Swede. Section three, the Mustards, are self-fertile. Self-sterility even in the Cabbage group is not, however, absolute. Mr. Nelson gives an interesting example of this fact in the case of the Cabbage Daniel's Defiance, grown not as a biennial but as a sort of annual. In this case seeds were sown in April, 1925, and flowering took place in May, 1926. On one part of the area which was wet, very few seeds set; six plants gave but sixteen seeds; on another part, which was dry, the self-set seeds were much more numerous; eight plants gave ninety-nine seeds. Environmental factors therefore count as well as factors of inheritance in determining self-fertility and self-sterility, and certain general practices followed by seed raisers thus receive their justification. Starving, keeping the plants "on the dry side," letting pot plants get somewhat pot-bound, and reducing the leaf area, are among the methods employed for inducing shy plants to set seeds. Finally, Mr. Nelson draws attention to the fact that fruitfulness and fertility are not synonymous terms; self-sterile plants, that is, plants which do not set seeds, may, nevertheless, develop normal-sized fruits—a fact which has often caused premature satisfaction in those of us who have hoped to obtain seeds from a promising hybrid, only to find at harvest time that the fruits, though large and plump, are empty. Cruciferous plants are often of this deceptive habit and, of course, the edible, seedless fruits afford examples of the fact that pollen has several distinct functions to fulfil, among which are fertilisation and stimulation of growth and fruit. It is of good augury for the industry of seed-production that our great firms are paying more and more attention to the study of the pure science of their industry. As the world goes on, the easier things get done, the difficult remain to do, and these difficult things are best done by combining the drive, industry and acumen of the plantsman with the scientific training of the

research worker. As this paper shows, valuable results accrue from that happy combination.

Blackpool Flower Show.—The first great show at Blackpool will be held in Stanley Park on July 20, 21 and 22. Sir Walter de Frece, M.P. will perform the opening ceremony at 10.45 a.m. on Wednesday next, in the Mayor's Pavilion; Woodland Road entrance to be used. During the evening of the opening day the President—Alderman R. Fenton, Mayor of Blackpool, and the Flower Show Committee will entertain the judges, pressmen, principal exhibitors, etc., to dinner at the Clifton Hotel. Everything points to a very successful show, and fine weather only is needed to ensure an attendance that will bring business to the trade exhibitors and much gate money to the Committee.

Weather in New Jersey, U.S.A.—Bad as our weather is (or has been), we in Britain are not having all the bad weather in the world; Mr. T. A. Weston, who is known to many readers of *The Gardeners' Chronicle*, wrote to Mr. Wm. Cuthbertson on June 19 as follows: "This is a 'wet' Sunday, so I cannot even look outside and am therefore writing. We cannot seem to settle down to summer weather, although we have had a few moderately warm days, but not above 80°. There have been lots of dull days and so much rain this season that I have not used the hose or sprinkler system. Everything is most rank in growth, but the rain has spoiled the Paeonies, while Delphiniums, etc., are so strong that I cannot tie them up fast enough. Roses are by no means at their full, ramblers or bush. Pansies and Violas are enjoying the coolness, but the former do not flower—just grow. The same relates to the English Violas, like Moseley Perfection. Jersey Gem is solid with flowers." The last-named plant is a charming miniature Viola of Mr. Weston's own raising which is succeeding well in this country, where it has been properly tried.

Swanmore Park Gardens.—On behalf of the National Memorial to Queen Alexandra, W. H. Myers, Esq., will open his beautiful gardens at Swanmore Park, Bishops Waltham, Hampshire, on Wednesday, July 20, and again on Thursday, August 18. We feel sure many of our readers will take advantage of these opportunities to assist the Memorial Fund and to see the gardens where Mr. Ellwood has proved such an able successor to the late Mr. Edwin Molyneux.

Presentation to a Green Keeper.—In order to mark the twenty-first anniversary of the Essex County Bowling Club, Westcliff-on-Sea, the President, Mr. Cutler, made several presentations, including a medal to Mr. John Richardson, who has been keeper of the greens for the past fifteen years. Mr. Richardson is an old gardener; he was apprenticed at Knockderry Castle, Cove, Dumbartonshire, and was subsequently employed at Shendon Gardens and Castlemilk, Lanarkshire, and finally in the Glasgow Parks under the late Mr. Whitton. It was from Glasgow that he was appointed to Westcliff. The medal bore the inscription "Twenty-first Anniversary. Presented by Mr. Cutler, President, for fifteen years' faithful service."

China Tea.—An interesting article on the growing and preparation of Chinese Tea is contained in the *Journal of the Royal Society of Arts* for June 10. It would appear that the best Chinese teas are grown on terraced hillsides. The leaves are plucked and laid out in the sunshine on straw mats, being turned occasionally so as to ensure their drying evenly. When a rich green state is reached, tests are made to see that drying is not carried to a point where the leaves become brittle. The tea is then placed on wicker or Bamboo trays and rolled backwards and forwards with the palms of the hands for a period varying from thirty minutes to an hour. The third, or fermentation process, determines whether the product is to become black or green tea. The leaves are placed on a flat surface and covered with a damp cloth. The process is sometimes hastened by the use of covered wicker baskets under a slow fire. The treatment, which takes from two to six hours, according to the weather and the method

adopted, is completed when the leaf takes on a copperish tinge; but if the tea is required to remain green, the fermentation is checked before any change in the colour of the leaf occurs. The most important stage is that of firing, for the flavour of the tea is determined during this process. The leaves are placed in a basket about thirty inches in diameter and three feet in height, open at both ends, and having a light Bamboo bottom placed about half way up. The basket is placed over a charcoal fire, all remaining moisture being thus driven off. The fifth and last process is sifting and grading. The best Chinese teas are not artificially scented, the real connoisseur taking delight in the natural aroma. Scented tea comes mainly from Foochow, and is prepared by heating certain kinds of flower petals with the tea leaves. In some instances the petals are left in the tea, while in other varieties a layer of fresh Jasmine blossoms is sprinkled over a layer of tea, the layers alternating until the basket is filled. The receptacle is then placed aside until the perfume has thoroughly permeated the tea, which is afterwards separated from the flower petals. This mingling of the tea leaves and flowers is repeated until the desired aroma has been obtained. The flowers commonly used for the purpose are the white Jasmine (*chu lan*) and the "yu lan," a species of Magnolia. The Jasmine is very expensive, and costs the tea makers from £4 to £8 per picul (133½ lbs.).

Cupressus Lambertiana var. gracilis.—We are informed that M. Henri Detriché, Route des Ponts de Cé, Angers, has registered *Cupressus Lambertiana var. gracilis* with the International Bureau of Registration of Novelties. The variety is said to have very fine foliage, and will be distributed by M. Detriché, who is stated to be the raiser. *Cupressus Lambertiana*, Gordon, is regarded as synonymous with *C. macrocarpa*—the Monterey Cypress—of which there are well-known golden and fastigate varieties.

British Industries Fair.—Despite the huge increase in the space provided in both London and Birmingham for the British Industries Fair of 1928, there are ample indications that all of it will be booked up much earlier than ever before. A significant feature of the applications is that twenty-five per cent., so far, are from firms which did not exhibit last year, some being newcomers and others firms which have exhibited before, but not for four or five years.

New Roses at Vincent Square.—The National Rose Society's exhibition of new Roses is to be held in the Royal Horticultural Hall, Vincent Square, S.W.1, to-day—Friday, July 15. This exhibition promises to provide the most extensive and varied display of new Roses ever brought together. Popular features of the exhibition will be the competition for the Gold Cup given by the *Daily Mail* for the best new scented Rose of the year; and the new Roses that will be staged for the award of the Society's Gold Medal. The entries, which are confined to British raisers, are so numerous that they promise to create a record.

Rhododendron Association.—A meeting of those interested in the new Rhododendron Association was held at Vincent Square on Tuesday, July 5, at five o'clock, at which the rules of the Association were formally adopted and it was decided that all present at this meeting, together with those who attended the first meeting on the 3rd May, should be Founder members. The following were elected to form the first Council of the Association.—Mr. Lionel de Rothschild, President; Vice-Admiral Heneage-Vivian, Vice-President; Mr. J. B. Stevenson, Treasurer; with Mr. J. J. Crosfield, The Marquess of Headfort, Mr. G. W. E. Loder, The Hon. H. D. McLaren, Mr. Peter Veitch, Mr. F. Gomer Waterer, Mr. E. H. Wilding and Mr. P. D. Williams, Members of the Council. It was decided that any subscriptions received during 1927 should carry full membership until December 31, 1928. As a secretary has not yet been appointed, all communications concerning the new Association should be addressed to Mr. Lionel de

Rothschild, New Court, St. Swithin's Lane, E.C.4. It is hoped to have a book of rules printed and membership forms prepared shortly.

Mr. Charles H. Wright.—Many old Kewites who have received instruction and much kindness from Mr. Charles H. Wright will, we feel sure, be pleased to see his portrait on this page. Mr. Wright was born at Oxford and is the only son of Mr. Charles Gilbert Wright, who was well-known to many generations of University men. He himself received his education at New College School, Oxford, and his early training in the herbarium and laboratory at Oxford Botanic Gardens, under Professor M. A. Lawson, at the time when Mr. W. H. Baxter was Curator of these gardens. Here he acted as Demonstrator in botany in 1883-4, but in the latter year was appointed Assistant in the Herbarium at the Royal Gardens, Kew, where he has remained ever since. In 1908 Mr. Wright succeeded Dr. O. Stapf as Assistant

MR. CHARLES H. WRIGHT, A.L.S.

Keeper of the Herbarium, therefore he has served under no fewer than four Directors of the Royal Gardens and five Keepers of the Herbarium. He succeeded Dr. J. G. Baker as lecturer in Systematic Botany to the student gardeners, and in 1899 he took charge of the Petaloid Monocyledons and Ferns in the Herbarium. Ever since 1896, Mr. Wright has been sub-editor of the *Flora of Tropical Africa* and *Flora Capensis*, and meantime has worked out various families in these floras, and also in the *Index Florae Sinensis*. He has contributed many papers to scientific publications, including a Monograph of *Roxburghiaceae* to the *Journal of the Linnean Society* in 1896, and in the same year he was made an Associate of the Linnean Society. Among other duties he has undertaken is that of Assistant Examiner in Botany to the Science and Art Department, South Kensington in 1899, 1900 and 1901. His long association with Kew and the science of botany has brought him into direct contact with many of the leading horticulturists, past and present, notably Dr. Maxwell T. Masters, Mr. H. J. Elwes, Mr. W. Gumbleton, Sir Charles Strickland, Mr. A. Kent and Mr. James O'Brien, all of whom have been frequent visitors to Kew. Kew has a wonderfully fine collection of drawings, and the rearrangement of this collection by Mr. Wright has been one of his most pleasurable duties. Although several other people have served at Kew as long as Mr. Charles H. Wright, it is probable that he holds a record there as an established civil servant. Notwithstanding his many duties, Mr. Wright has found time to take an interest in social and political affairs in the district, and we remember that for quite a

long period he was captain of the local Church Lad's Brigade.

The Potato Crop.—The Monthly Agricultural Report of the Ministry of Agriculture states that early Potatoes are giving only light yields and the tubers are small. Main crops, though still rather backward, are healthy and vigorous as a rule, and have come on quickly since the rains. On the whole, the present appearance of the plants suggests crops practically up to average in most of the chief Potato districts, although in many parts of Yorkshire the crops were damaged by frosts in June and only light crops are anticipated.

The Fruit Crops in Northern Ireland.—According to the Monthly Report issued by the Ministry of Agriculture for Northern Ireland, it is generally anticipated that, apart from isolated orchards, the yield of practically all classes of fruit will be below the average this season. Apple trees were affected by frost in April when the buds were beginning to shoot, and considerable damage was also done by the frosts which occurred in May and early June. In most parts of the counties of Antrim and Armagh there will be poor crops of Bramley's Seedling, this variety having suffered severely. In the counties of Down and Tyrone, Grenadier and Worcester Pearmain apparently escaped the frost fairly well, and promise to give a fair crop, and even in County Antrim, where Apples are a failure generally, Grenadier is regarded as having a favourable crop. Allington Pippin is expected to give only a poor yield. The Pear crop, while not a complete failure, is expected to prove light, while it is also anticipated that, except in very sheltered positions, Plums and Damsons will show a poor yield. The crop of Gooseberries is fairly good, but in some districts the frosts of April and May damaged this crop at the critical period. White, Red and Black Currants were also involved in the disastrous frosts of April, and the crops will be below average. The prospects for Raspberries are very good, and Strawberries are also expected to give a fair yield. Insect and fungous pests have not been so virulent this season as in previous years. As regards insect pests this immunity is attributed to the fact that many trees were sprayed during the winter with tar distillate. Where trees have not been sprayed aphids and Apple sucker have been prevalent. Canker and Apple scab continue to do considerable damage to the Apple crop, although these diseases are less serious than in previous years.

Failure of Outdoor Carnations in the North.—Considerable interest has been evinced in northern gardening circles this season, writes a Scottish correspondent, on the unusual mortality amongst Carnation plants. The plants weathered the cold snap, grew, in fact, but when the atmospheric conditions improved as regards temperature, they "wilted"—first cast their green sheen, became yellowish in appearance and hung limp to the stakes. The trouble has been attributed by some of the best growers to excessive damp. During spells of wet weather, owing to the peculiar formation of their leaves, Carnations will unduly retain moisture, which in time causes serious injury to the stem, and that immediately below the soil, causing the final collapse of the plants without the presence of any other disease. Mr. W. Grant, gardener at Crathes Castle, near Aberdeen, advises growers in the north to grow the older-fashioned and hardier types of the Dundas Scarlet section, Corona, Ruby Castle, Mrs. Nicholson, Duchess of Rothesay, etc., and only to increase the stock of those which are found to do well. He states that many of these old varieties give annual sheaves of flowers and cause little anxiety about fungous diseases. Mr. Grant's last word of advice is a reminder that a light, sandy soil that will become parched in dry weather does not suit the average Carnation, as roots that have been made near to the surface in normal weather perish, and the plants contract red spider owing to the dryness, but a fairly stiff, well-drained soil that will keep fairly evenly moist is much better suited to the Carnation.

Sugar Beet Industry in Scotland.—Rapid extension of Sugar-Beet growing in Scotland is being made, for farmers are beginning to realise more and more that there is "money in the industry." The chief limiting factor in a more rapid extension of the acreage under Sugar-Beet is the paucity of factories. Too great a distance from factories make would-be growers rather timid of entering wholeheartedly into the business, but in time this disability should be remedied. Nevertheless, from a small beginning a few years ago, the returns from the industry now annually amount to a very considerable sum. The Government subsidy has much to do with the abnormal advance made, but on all hands it is admitted the investment is a sound one. It is computed that over a fairly large area the profits amount to something like £6 2s. 6d. per acre. The subsidy diminishes in amount—it began in 1924-25—after four years have elapsed, but notwithstanding this it is felt by those chiefly concerned that home-grown Sugar can, as a fully established industry, look forward without anxiety to the ultimate expiration of the subsidy.

Photographic Survey of Deeside.—A novel movement has been inaugurated by the members of the Deeside Field Club, and one which might well be emulated by other field clubs. The project is to compile a photographic survey of Royal Deeside—a collection of views that will adequately illustrate the topographical and other features of the beautiful countryside drained by the Dee, near the head of which stands His Majesty's Highland home, Balmoral Castle. As may be supposed, the members are securing the help of those willing to assist, and who are possessed of the necessary qualifications. The following are the kinds of pictures desired, and the hints may prove useful to other field clubs who may be inclined to do likewise:—
Scenery: Mountains, mountain valleys, corries, table-lands; lowland scenes, moorlands, woodlands; lakes, tarns; stretches of the Dee and its tributaries; rock gorges, waterfalls, rapids, noted salmon pools, views from prominent points, views of all types of scenery, not only pretty points, are invited. Towns and villages: General views, streets, buildings and other places and objects of interest. Houses: Castles, mansion houses, farms, crofts and cottages. Occupations of the people: Harvesting, past and present: cutting and drying of peats, timber cutting, etc. Sport and games: Deer stalking, salmon fishing, athletics, school games. Antiquities: Stone circles, isolated stones, cairns, hut circles, sculptured stones, hill forts, camps, scenes of historic interest, traces of former human occupation in historic times. Fauna and Flora: Illustrative of animals and plants in their natural setting. Gifts of old prints on any of the foregoing subjects are also invited. Of course, the Club does not wish to acquire copyrights, but it will be assumed that the gift of a print includes permission to reproduce it in any of the Club's own publications, or as a lantern slide, and the right to exhibit such at any meeting of the Club.

Appointments for the Ensuing Week.—**MONDAY, JULY 18:** Harrogate and District Horticultural Associations' meeting. **TUESDAY, JULY 19:** Royal Horticultural Society's Committees meet; National Carnation and Picotee Society's show; London and South of England Viola and Pansy Society's show; Yorkshire Agricultural Society's show at Darlington (three days). **WEDNESDAY, JULY 20:** Blackpool Flower show (three days); Liskeard and District Horticultural Society's show; Ringles Cross and Uckfield District Sweet Pea Society's show; Compton and District Horticultural Society's show; Tibshelf Horticultural Society's show. **THURSDAY, JULY 21:** St. Stephens Horticultural Society's show; Orpington Horticultural Society's show. **FRIDAY, JULY 22:** Bristol Floral Fête (two days); Birmingham Floral Fête (two days). **SATURDAY, JULY 23:** National Carnation and Picotee Society's show in conjunction with Forest Row Horticultural Society's show, at Kidbrook Park, Sussex; Sundridge and Brasted Horticultural Society's show; Falkirk Rose show; Springfield (Fife) Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.

Horticultural Society's Show at Chiswick.
The magnificent weather of Saturday last enabled the Horticultural Society to bring to a brilliant close a season of exhibitions which, during their long career, have never been equalled. The number of visitors was 8,820, and it was long before they exchanged the coolness and massive shades of Chiswick House for the more open and sunny lawn in the Society's garden. The show was, we think, the best which July has ever produced, and not by any means deficient in novelties of importance. Messrs. Veitch sent flowers of the New Zealand *Dracaena*

helplessly about the lower rounds of the horticultural ladder. As for ripening, that would not seem to enter into consideration at all, at least, among Grapes, which, in many cases, look as if they were shown for the express purpose of setting the teeth on edge. In classifying the whites we could find no better names to express their appearance than Verdigris-green, Grass-green, and Asparagus-green. What a contrast was presented between the verjuice bunches of Constantine, Martin, Campbell, Davis, and Summerby, well-grown as they were, and the admirable Chasselas from Lord Southampton's garden. Let us add, while our critical humour

FIG. 18.—ROSE LADY FORTEVIOT.

N.R.S. Gold Medal, July 1. Flowers orange-gold. Shown by Messrs. B. R. Cant and Sons. (see p. 36).

indivisa, a plant now seventeen feet high, with the habit of a Yucca, and apparently hardy; and along with it a couple of pretty annuals—the one a yellow *Leptosiphon*, the other a *Collinsia bartsiaefolia* resembling *C. bicolor*. Messrs. Standish and Noble produced the beautiful Jezoe Spruce, with rich, light green foliage, and two very distinct forms of Fortune's *Cephalotaxus*. A little *Medinilla* (*Sieboldii*) from Mr. Colyer's garden, attracted much attention, as also did some collections of variegated plants from Messrs. Lee and Rollissons. Fruit growers are evidently behind plant growers, as becomes more and more evident each year. For although some of the Exhibitors always stand on the highest point to which gardening can reach, yet it must be owned that numbers still continue to cluster

lasts, that among flowers it would be a great improvement if nurserymen would take the trouble to name their plants with some regard for accuracy; or, at least, if they would not produce the most trifling varieties, if varieties at all, of well-known plants, with new names that can be intended for no other purpose than to sell them by. *Gard. Chron.*, July, 17, 1852.

Publications Received.—*A Bird Book for the Pocket*, by Edmund Sandars; Oxford University Press, Amen House, Warwick Square, E.C.4.; price 7/6 net.—*Poisonous Plants: Deadly, Dangerous and Suspect*, with brief descriptions by W. Dallimore; edited by Dr. A. W. Hill; Frederick Etchells and Hugh Macdonald, 1A, Kensington Place, London; price £2 12s. 6d.

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Cattleyas.—Such autumn-flowering Cattleyas as *C. labiata*, *C. Gaskelliana*, *C. Bowringiana*, *C. Dowiana* and its variety *C. Dowiana aurea*, also the numerous hybrids derived from these species are commencing to make new growth and should be placed in the lightest and warmest position in the Cattleya house; of all the elements necessary to the proper development of Orchids none is of more importance than light. The supply of water at the roots should be gradually increased as the new growths attain strength, taking care that the compost becomes dry between each application. *C. gigas* and its many varieties are growing freely and should be afforded a light position near the roof-glass at the warmer end of the warm Cattleya house. When the flower sheaths are observed water should be afforded the plants whenever they become dry. *C. Schröderae*, *C. Lawrenceana* and others, which have passed out of bloom, should be allowed a slight rest by being kept on the dry side for some little time. Any plants that require fresh rooting-material may be attended to when new roots are observed to be developing. Plants of *C. Mendelii*, *C. Mossiae* and their hybrids that have failed to produce flower sheaths may also receive this attention should they need it.

Coelogyne.—*C. asperata*, *C. Dayana* and *C. Massangeana* produce their flowers at this season of the year. Although their colours are not particularly bright, the flowers of these Coelogyne are attractive, and produce a fine effect when the plants are well-flowered, as the graceful racemes present an appearance quite distinct from the other members of the genus. The species named have much the same habit of growth, although the flowers are quite distinct, and with the exception of *C. Massangeana*, which does best in a warm, intermediate temperature, need plenty of heat and moisture when in full growth. Plants of the strong and free-growing species require to be grown in good-sized receptacles provided with ample drainage, and they are best cultivated in shallow pans or baskets suspended from the roof, under moderate shade. Well established plants require copious supplies of water during the growing season, and for this reason it is not advisable to place too much material about their roots. These plants enjoy a sweet root-run, and too much stress cannot be placed upon the fact that no Orchid can succeed in decomposed rooting materials; they should therefore be examined each year after flowering, and any compost showing signs of deterioration should be substituted with fresh. The compost should consist of rough peat and coarse *Osmunda* fibre, mixed with *Sphagnum*-moss.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Carrots.—Make a good sowing of Carrots on ground which has been cropped with early Potatoes. Fork the soil, and dress it with a little superphosphate, wood-ash, and a liberal sprinkling of soot. These materials should be well raked in the soil and the latter made fairly firm before sowing the seeds. The Shorthorn or stump-rooted varieties are best to sow at this season. Sow the seeds thinly in drills made one foot apart; do not thin the crop severely, as very small Carrots will be much appreciated in the autumn, and can be drawn for use as required. A still later sowing will provide roots for use until next spring. Use the Dutch hoe as often as possible, and dust the rows with old soot.

Tomatos.—Up to the time of writing the weather has not been favourable to Tomatos

in houses; June was practically sunless and cold. Complaints are general of the fruits setting badly and the plants making sappy, strong growths, especially where they are planted out in borders. It is under these conditions that *Cladosporium* is most prevalent, though this disease is more often due to insufficient ventilation, causing a close, stuffy atmosphere. White fly is often troublesome, but this can easily be destroyed by Cyanogas. Plants that are cropping freely should be fed at alternate waterings with liquid manure. This stimulant may be varied with other good artificial manures. It is often noticed that many of the fruits have yellowish patches. This is sometimes caused by a check to growth, but more often by a lack of potash in the soil; care should therefore be taken to make sure that the plants are provided with potash in some form. Keep all side-growths pinched out at an early stage, and see that the plants are kept tied securely to their supports. Tomatos that were planted out-of-doors have, on the whole, made but little growth owing to the abnormally cold weather.

Marrows.—These, like Tomatos, have made very poor progress, but with warmer weather, growth will soon be evident and care should be taken to keep the shoots well pegged down or strong winds will break them. Marrows planted earlier in frames should now be fruiting freely. Keep the growths trained thinly and feed the roots with weak liquid manure.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brocket Hall, Hertfordshire.

Primula malacoides.—Seeds of an improved strain of this popular plant may be sown now in a cool house; the seedlings will appear very quickly. This plant will never thrive in a dry, warm atmosphere, but is a success in a cold frame. The seeds should be sown in pots filled with a light, open compost, and covered very lightly with soil. Place a piece of glass over the pot, and shade the soil from bright sunshine. Under these conditions the seedlings will soon appear above the surface, when they should be gradually exposed to more light; at the same time, they will need shading from bright sunshine.

Hydrangeas.—So soon as strong shoots can be obtained, cuttings of this useful plant should be inserted without delay. Where space is limited, three cuttings may be rooted in a small, sixty-sized pot, but they must not be allowed to become pot-bound, but repotted so soon as they are rooted. Most growers favour rooting *Hydrangea* cuttings singly in small thumb pots, placing the cutting near the side of the receptacle, but equally good results may be obtained by the former method. The cuttings should be stood in a case in a cool house, where they will soon form roots, and so soon as it is evident that the roots are active, the plants should be removed from the case and placed in a cool house near the roof-glass. After a few days' exposure to the light they may be potted on into other receptacles. Pot moderately firmly, but do not ram the soil too hard. The young plants will need careful watering until the roots are established in the new compost; occasional spraying of the foliage will prove beneficial until they are well established. Although careful watering is recommended during their early stages of growth, *Hydrangeas* when growing freely need abundant supplies of water, especially during hot, dry weather. In the winter, when the plants are dormant, a frost-proof house is all that is needed. Where large specimens are required, they should only be pruned lightly into shape, for severe pruning is a frequent cause of the plants not blooming. All weakly growths should be removed and the plants placed in larger receptacles as becomes necessary. The colour of *Hydrangea* flowers, whether pink or blue, is probably influenced by the soil and water used. Most cultivators desire the blue shades, and this may readily be obtained by the use of a proprietary preparation sold for the purpose.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.
Ford Manor, Lingfield, Surrey.

Orchard House.—Very early fruits of Peaches and Nectarines are often not good flavoured owing to hard forcing, but they are appreciated in May, even if of inferior quality. Ripe wood is essential to success, and to ensure this the trees need a long season of growth, therefore, the sooner these early varieties are transferred to clean, dry pots the better. I recommended in a former calendar the necessity of having a good stack of loam, mixed with the other necessary materials, ready for use as wanted. The compost may be chopped down as required and exposed to the sun and air until it is dry and warm. Plenty of crocks, together with a few small bones or pounded oyster shells should be placed in the bottom of the pots for drainage. Pot fruit trees of all kinds require to be potted very firmly, therefore the compost should be well rammed until it is as solid as the old ball. As potting is finished, return the trees to their former position in a cool house and keep them rather close for a few days. If the balls of earth and roots were soaked thoroughly before repotting was done but little watering will be necessary until new roots become active.

Strawberries in Pots.—There have been many complaints of failure with this most useful fruit. Success in growing pot Strawberries lies in selecting suitable runners from the open ground plantations; they should be taken from young, vigorous plants early in the season. The pots in which Strawberries are grown do not require a large amount of crocks, but the latter should be clean and well placed. Worms are sometimes troublesome, hence the advantage of sprinkling soot over the crocks and also in the compost. The Strawberry is as easily grown to a high degree of excellence as any plant. The layers should be potted so soon as they are ready, using good fibrous loam, a little bone-meal, old mortar rubble and a little decayed stable manure. The soil should be made very firm with a wooden rammer. The plants make a great mass of roots before the end of the season, and when well-rooted need copious supplies of water. When the plants are making good progress and have healthy growth, very little, if any, feeding with liquid manure is necessary; many successful Strawberry growers condemn high feeding at any season, but more especially in the autumn.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park Barnet, Middlesex.

Summer Pruning.—Summer pruning of fruit trees, when done correctly, not only favours the development of sturdy, well-ripened fruit-bearing wood, but the removal of surplus growths allows sunlight and air to enter the trees and the fruits become larger, finer and better-flavoured. When carrying out the operation it must be remembered that certain varieties are naturally of robust growth and need very careful management. Neatly-trained trees that develop a moderate amount of wood annually usually bear the best fruits.

Wall Trees.—The summer pruning and thinning of the young shoots on wall Plum trees should not be done too early or too severely at first, as this might be followed by fresh growth closer to the main branches than is desirable. Shorten all shoots that are not required for extension to four or five leaves. Train in young shoots for furnishing the space and to take the place of any of the old branches that may be removed. Stop or rub off gross shoots and all foreright ones, with the object of having the trees furnished with shoots of medium strength, as these fruit best. Trees growing too strongly to be fruitful should be marked for root-pruning when the proper time to do this arrives.

Bush Trees.—Examine young trees and remove some of the shoots where there is a danger of the head being crowded, also any which may

cross or otherwise press against others. This will ensure plenty of air and light reaching the main fruit-bearing wood when in leaf. A little timely pruning at intervals in summer is very important to obtain evenly-shaped, fruitful trees, and the removal of these young shoots does no harm when the trees are in full leaf, for the sap will be diverted to other channels where it will be of far greater service.

Grafted Trees.—Examine trees that were grafted in spring. If the scions have united and are growing freely, see they are made secure against strong winds. A good plan is to tie thin Bamboo canes to the old wood and fasten the grafts thereto with raffia. Remove all young growths on the stems and branches below the grafts so that all the sap may be diverted to the scions. Young, healthy grafted trees that have not been headed back too severely will come into bearing quickly.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Transplanting Seedlings.—Wallflowers and other plants used for spring bedding, which were raised from seeds sown some time ago, should be transplanted before they become crowded, in ground previously prepared for them. If the land was dug some time previously and is moderately firm, the resulting growth of the plants will be more sturdy and stocky than if they are put in loose, recently dug ground. This is very important, as large, soft plants usually lift and winter badly. Many cultivators consider it unwise to transplant Wallflowers and other subjects used for autumn planting during spells of dry weather, and this often results in the seedlings being left in the beds until they become crowded and spoiled. Delay is quite unnecessary, for if the roots are dipped in a puddle of clay and well-watered afterwards, they may be safely moved at any time. The method of watering is also important. A depression should be left around each plant which should be watered separately with a watering can. When the water has soaked away, the dry soil should be drawn around the plant to form a loose mulch. By this method one watering is usually sufficient, and the surface of the bed is not rendered hard and caked by repeated surface watering.

Staking and Tying.—Plants in herbaceous borders will require constant attention in staking and making the shoots secure against high winds and rain. Many summer-bedding plants will also require attention in this respect, and some of them will require regulating and pegging down to the soil. Stakes placed to plants should be as inconspicuous as possible and the growths should not be bunched with the tying material, but secured in such a manner that the natural habit of growth is preserved.

Salvia nemorosa.—This beautiful *Salvia* is an ideal plant for grouping in the mixed border, also for growing in large lawn beds, or for planting in generous, informal masses in the semi-wild parts of the garden. Where large stocks exist, this *Salvia* may be propagated by division, but on account of its long, woody roots, this is not always easy. It may, however, be propagated from cuttings made of the young shoots when they are about four inches long; the best way, however, to raise a large stock quickly is to have stock plants and keep them cut down. The young growths made during June or July should be secured as cuttings, which may either be dibbled into a bed of soil in a cold frame or inserted singly in small pots, and if they are stood in a cold frame and kept close roots will form readily, and the plants will be ready for putting out during the autumn or following spring. Considering the beauty and long-flowering period it is surprising that this beautiful *Salvia* is not more generally used for garden decoration; it is usually sold as *S. virgata* or *S. virgata* var. *nemorosa*; the true *S. virgata* is, however, a distinct and much inferior species.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Greenhouse Climbers.—Many beautiful subjects may be usefully employed for furnishing walls and rafters in the greenhouse. *Rhodochiton volubile* displays its full beauty when grown overhead, its long, trailing shoots being covered with dark, chocolate-coloured, trumpet shaped flowers, each set in a purplish-coloured bract. The effect of a large plant is like a curtain, and very striking. This Mexican plant may be readily raised from seeds sown in spring and the seedlings grown on to flower in their second and successive years. *Tibouchina semi-decandra* is another splendid greenhouse climber, its large purple flowers being freely produced at the ends of the current year's shoots. A stock may be

Cyclamen.—Seeds of the florist's *Cyclamen* may be sown now in pans and germinated in an intermediate house. The pans should be filled with a compost of loam, leaf-mould and sand, and the seeds dibbled in about one inch apart, and half-an-inch deep. Cover the seed-pan with shaded glass, and keep the soil moist by dipping the pans to their rims as necessary. When the seedlings appear, accustom them gradually to cooler and airier conditions, and expose them to all the light available by placing them on a shelf near the roof-glass, where they may remain until ready for pricking off separately into small pots. Older plants which have been resting since their flowering period may be well watered prior to reducing the old ball of soil, and then repotted, using good loam, leaf-mould, some old mortar rubble and sand. Water the newly-potted plants carefully, and stand them either

FIG. 19.—MUTISIA RETUSA GLABERRIMA.

R.H.S. Award of Merit, July 5; Flowers blush. Shown by Sir William Lawrence, Bart. (see p. 38).

readily raised from cuttings of half-ripened growths inserted at almost any time when they are available. The white-flowered *Mandevilla suaveolens* is also worth growing in this way; its pure and fragrant flowers are borne in great profusion. This *Mandevilla* is best planted out, and not grown in pots. It may be raised either from cuttings made from side-shoots or from seeds. *Bomarias* are admirably adapted for furnishing rafters on which their large clusters of drooping, highly coloured flowers show to advantage. Many interesting hybrids have been raised, and two of these have distinct associations with northern gardeners as they are known as *B. Whittonii* and *B. Matthewsii*. *Bomarias* are also easily raised from seeds, and the hardier form, *B. Lehmannii*, may be grown in our western districts outside on a sunny wall. *Fuchsias* are not frequently employed as climbers, but some drooping varieties are most effective when trained up and along the roof-rafters, and in this position their pendant flowers are displayed to advantage.

in a frame or cool house, syringing them occasionally to keep the young foliage clean and healthy. The foliage of some of the plants is so beautiful as to make them valuable for decorative purposes, even when not in bloom.

Cabbages.—The main sowing of Cabbages should be made now, choosing early varieties which can be depended on to heart early in spring. Most seedsmen have their own specialities, and a selection is advisable, as only by trying the different sorts is it possible to find out which are best suited to the various districts. The small sorts represented by *Harbinger* and *April* may be grown about fifteen inches apart each way, but the larger maturing sorts, such as *Flower of Spring*, require more room. Sow the seeds thinly in drills made a foot apart, and endeavour to have strong, short-jointed plants. Should the soil be very dry at sowing time, water should be applied to the drills before sowing the seeds. Birds are fond of the tiny seedlings and where they are troublesome the bed should be netted.

INDOOR PLANTS.

ECHINOCACTUS MYRIOSTIGMA.

ECHINOCACTUS myriostigma is one of the most distinct and interesting members of the Cactaceae. When not in bloom it has more the appearance of the work of a sculptor than a product of nature. The silky, pale yellow, Daisy-like flowers are produced during the summer; each individual flower lasts only for about two days, but several are produced by each plant during the season.

The stems have usually five very prominent ribs, but some have only four, while others may have so many as seven. The bark is dotted with small, white, scale-like bodies which are composed of delicate interwoven hairs. The plant is a slow-grower and succeeds under warm greenhouse treatment in a sunny position. It should be planted in well-drained pots or pans containing very open, porous compost, and plenty of broken sandstone. From October to March practically no water is required at the roots, and the atmosphere should be kept dry; with a minimum temperature of 50°. Repotting should only be done when it is absolutely necessary. *T. H. Everett.*

ERANTHEMUM PULCHELLUM.

THE genus *Eranthemum* includes many plants well worthy of cultivation, and the above species is one of the best for winter flowering. *Eranthemum pulchellum* is a soft-wooded stove shrub, and the flowers are borne in spike-like clusters of a rich metallic-blue.

Cuttings root readily if taken in the spring. They should be placed in small sixty-sized pots containing a sandy compost, and rooted in a propagating case or hand-light in a warm house. When the plants have become well-rooted, they should be transferred to forty-eight-sized pots, using as a rooting-medium a mixture of fibrous loam and leaf-soil, with sufficient silver sand to render the texture porous.

After potting the plants place them in a house having a temperature of from 60° to 65°, on a bed of moist ashes, and allow them sufficient room to enable the syringe to be used freely amongst them. As the plants advance in size and the pots become well filled with roots, shift them into twenty-four-sized pots, in which they will flower, using a similar compost as before, but with a little well-decayed horse manure added. When the plants have become well-established in these pots feed them liberally with liquid manure, varying this with an occasional dusting of Clay's fertiliser, but discontinue feeding when the flowers show signs of expanding.

After flowering, gradually withhold water to allow the plants a slight rest. Having been sufficiently rested, prune them and repot them, taking away as much old soil as possible without injuring the roots. They may then be accommodated in smaller pots, and grown on again as advised for young plants.

Eranthemums, when well-grown, will attain a height of fifteen inches to twenty inches, and produce a wealth of rich blue flowers in winter, and often well into the spring.

MOSCHOSMA RIPARIUM.

THIS beautiful winter-flowering plant is seldom seen in private establishments, although when well-grown it is a fine subject for associating with *Coleus thyrsoideus* and *Poinsettias*; it comes into bloom when the *Chrysanthemums* are just going over, and when flowers are scarce. Cuttings should be inserted in small sixty-sized pots in a very sandy compost and rooted in a propagating case in a warm house with a temperature of 60° to 70°. When the cuttings have become sufficiently rooted they should be hardened gradually, prior to placing them into fifty-four sized pots, using a rooting-medium consisting of fibrous loam, leaf-mould and coarse silver sand. When well-established in these pots the plants should be stopped to form bushy, even-balanced specimens.

After these growths have developed sufficiently pot the plant for the final time in six-inch or seven-inch pots, using a compost somewhat

similar to that used before but enriched with old Mushroom bed manure.

After potting the plants place them in a house having a temperature of from 55° to 60°, as near to the roof-glass as possible, to keep them sturdy. About the middle of June a cold greenhouse or frame will suit them. Syringe the plants occasionally with tepid water during bright days, and give them frequent applications of manure water, varying this with occasional doses of soot-water, about once a week, but discontinue feeding when the flower spikes begin to expand. During September, remove the plants to a house having a temperature ranging from 50° to 60°, in which they will flower.

After flowering, gradually withhold water, without absolutely drying the plants off. When the growths have become sufficiently ripened, prune them to about one foot of the pot and place the latter on a warm shelf, to obtain cuttings for the following year's supply.

Moschosma riparium will remain in flower from six weeks to eight weeks if careful ventilation is given them during that period, and when cut the spikes will last a considerable time in water. *E. Baker, Garston Manor Gardens, near Watford, Herts.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM DEVONIANUM.

AMONG the many species of *Dendrobiums*, few have more beautiful flowers than those of *D. Devonianum*. These are borne on slender, pendulous stems, two feet to three feet in length, and they appear at the nodes.

The sepals and petals are creamy white, tinged with pink, and the petals are tipped with magenta. The lip is white with a purple margin and the base is of orange colour. The sepals, petals and lip are all fringed around the margins, and the flowers remind one very much of those of *D. Falconeri*, another Indian species, of more pendulous habit than *D. Devonianum*.

Cultural details for the two are similar, but *D. Falconeri* must be grown on a raft, or piece of bark and suspended, while *D. Devonianum* should be potted and have its pseudo-bulbs staked upright, to obtain the best results.

The compost should consist of *Osmunda* fibre, *Sphagnum*-moss, crocks and charcoal, allowing more moss than for *Cattleyas*.

As in the case of all *Dendrobiums*, overpotting must be guarded against while, in the actual potting, firmness should be the rule.

With the approach of winter, water should be withheld from the roots, to ensure ripening of the pseudo-bulbs, but these must not be allowed to shrivel from lack of water. Given this attention the plants will delight the grower with numerous flowers in the spring. *J. Robbie.*

FLOWER GARDEN.

PAEONIES.

THE only possible defect to be urged against the beautiful modern forms of this old-world plant is a somewhat short flowering season, but this is a fault of many other garden favourites. The *Paeony* grows best in a rich soil rather on the light side, and it is very desirable that the ground should be prepared thoroughly, as the plants dislike disturbance and will remain for several seasons. Possibly the best time to plant is late summer or early autumn although if necessary, the planting season may be extended until March; *Paeonies* are not fastidious as to position, but I always endeavour to choose a somewhat sheltered situation in view of the damage to the heavy flowers which invariably results from high winds.

An annual mulching of well-rotted manure is beneficial to the plants and is best applied in early spring, also an occasional light forking over of the beds is desirable.

Support for the plants is essential, but formal staking should not be attempted; rather place brushwood amongst the plants for the purpose.

The plants are undoubtedly very effective when massed in a border, but irregular drifts or clumps in the mixed border will contribute gay flowers in June; the *Paeony* border may be rendered bright in spring by a planting of *Tulips*, *Darwin* sorts for preference, and, earlier still, a little colour may be obtained from *Muscari*, *Anemone fulgens* and similar bulbs. These bulbs will not in any way damage the *Paeonies* and even the *Darwin Tulips* may remain for a few seasons undisturbed. The older and less expensive *Paeonies* may be freely planted in woodland and in the wild garden, those with a delicious perfume near to the house, for these will be appreciated the most.

A continuous display of bright colours may be obtained from the *Paeony* border in summer and autumn by the use of *Gladioli*, *Hyacinthus candeans* or such *Liliums* as *L. regale*, *L. Henryi*, *L. pardalinum* and *L. Willmottiae*, the *Lilies* invariably wintering satisfactorily in *Paeony* beds. Not the least of the several attributes of the *Paeony* is the fine autumnal colour assumed by its foliage. As a cut flower, the *Paeony* lends itself to bold floral decorations and is, indeed, emblematic, with the *Rose*, of the English summer.

The foliage should not be removed from the plants until it is wholly decayed or until the stems part readily from the crowns, which should not be until late autumn; it is wise, in some districts, to afford a little protection to the spring growth, severe frost occasionally doing considerable damage, but apart from this susceptibility to injury of the young, tender growths the *Paeony* is remarkably hardy and almost if not quite, immune from insect pests. Varieties are numerous; a selection is best made from a collection in flower, wherein the single-flowered varieties will not be subdued by the more puissant doubles. The *Rose*, the *Lily* and the *Paeony* make a beautiful garden of themselves. *Ralph E. Arnold.*

SUTHERLANDIA FRUTESCENS.

THE Cape Bladder *Senna* is an upright-growing plant with pretty, glaucous, pinnate foliage. It is well-suited for use as a "dot" plant in summer bedding schemes.

The scarlet flowers are about one inch to one-and-a-half inch long; they are of drooping habit, and resemble those of *Clanthus puniceus*.

The flowers are succeeded by inflated seed pods, not unlike those of *Colutea arborescens*. The species is a native of South Africa and may be raised from seeds, but the better plan is to strike cuttings of young shoots taken from stock plants in spring. These should be inserted in pots of sandy soil and placed in a close propagating case until rooted. Plants propagated in this manner flower when smaller in size than seedlings. *T. H. Everett.*

VERBENA BONARIENSIS.

THIS plant was first described by Linnaeus in his *Species Plantarum*, 20. He also described or recorded it in *Hortus Upsaliensis* and *Hortus Cliffortianus*. Dillenius described and figured it in *Hortus Elthamensis*, 406, t. 300, f. 387; so that the old-time botanists seemed to think much of this plant from Buenos Ayres.

According to Loudon, it was introduced to this country in 1732. It is most nearly allied to the well-known *V. venosa*, with densely fasciated, but smaller flowers than those of that species, though similar in colour. The lanceolate, wrinkled leaves clasp the stem, which rises up to a height of five to six feet.

I had some live specimens given me by Messrs. Isaac House and Son, and they closely resembled dried specimens I have seen from the Canary Islands. I believe they said the plant was not quite hardy, but Loudon described it as a biennial. Other specimens I had from a correspondent had been grown under glass, for the leaves were several times as large as those from the open. *J. F.*

TREES AND SHRUBS.

INDIGOFERA GERARDIANA.

ALTHOUGH this beautiful flowering shrub is usually recommended for clothing a wall space it may also be grown in the open in the southern counties. In anything approaching a severe winter the shoots will be killed almost to the ground level, but this is no real drawback as the best effect is obtained when the growths are pruned hard back annually. In the private garden a more serious objection may be that growth starts rather late in the year, so that there is an apparently barren space where the shrubs are grown. But this may be readily overcome by associating the shrub with an early, spring-flowering species or a dwarf evergreen. The best floral effect is obtained from *Indigofera Gerardiana* where it is given a sunny position, when it will make annual growths three feet to four feet in length and flower continuously from the present time until, at least, the end of September. The Pea-shaped flowers, which are borne in short racemes from the axils of the graceful pinnate leaves, are of bright rosy-purple colour. A. C. B.

PHILADELPHUS.

THIS genus of handsome shrubs with simple leaves and snowy-white flowers provides us with a valuable race of fragrant, July-flowering plants. They bloom profusely in almost any soil and situation, and the fact that they flower at a period when the great bulk of flowering shrubs has passed, gives them an added value, while for making massive effects in a short time few plants can equal them.

P. coronarius, the first introduced species, is the earliest to flower, but later-introduced species, such as *P. latifolius* and *P. Gordonianus*, together with recently-introduced varieties, carry the flowering season well through July.

Amongst recent introductions the variety *Monster* is one of the best of the tall growers. Of remarkable vigour, it soon forms a bush ten or twelve feet high, every branch being laden with wreathes of large, pure white, single flowers often as much as two inches in diameter. *Bouquet Blanc* is a variety of medium height producing a wealth of flowers in clusters along the branches. *Lemoinei* is a charming shrub of graceful habit, with flowers and leaves of intermediate size, and very suitable for the front of the shrubbery border.

Amongst the double or semi-double flowering varieties, *Virginal* is of outstanding merit, the individual flowers being very attractive. *Boule d'Argent* has large flowers of delightful fragrance, and *Mer de Glace* has silvery white flowers, borne in rich profusion.

WISTARIAS.

THESE vigorous-growing plants are amongst the most beautiful of our hardy climbers, and are excellent subjects for clothing walls, pergolas and bowers. Nothing could be finer than a well-developed *Wistaria* in full blossom in the spring of the year, its long, drooping racemes of slightly fragrant flowers hanging in tiers in a most graceful way. *Wistarias* grow freely in almost any aspect, are capable of covering wide areas and seldom fail to yield their flowers in rich profusion.

Their cultivation offers no great difficulties for, given a moderately good and well-drained soil, they grow freely from the time they are planted. When planted against a wall or on a pergola a system of cordon training has to be followed on which the production of short, sturdy, spur-like growths is encouraged. When their main growths are developed, subsequent pruning consists in the cutting back of secondary growths at the base of which flowering buds are freely produced. Plants grown on pergolas will need similar attention, but when growing freely over trees or large bushes they may be left to ramble at will.

There are several methods of propagation, the most satisfactory being by layering growths in sandy soil. Cuttings of ripened shoots may also be struck in the autumn, or shoots

may be grafted indoors in spring on sections of root.

W. sinensis is the best known species and has been grown in this country for about a century. Its mauve flowers are borne in racemes about a foot long, and it may be expected to flower freely each spring. *W. multijuga*, introduced at a later period, is less well known but an equally desirable plant. It is particularly well adapted for planting on pergolas and bowers where the long racemes frequently reach a length of three feet, and are displayed to the greatest advantage. There are several varieties of this species, notably amongst which are *alba*, producing long racemes of pure white flowers and *rosea* with pale, rose-coloured blossoms, the racemes being produced with remarkable freedom. A. P. C.

distinct varieties, among which should be mentioned the dwarf forms, rendered interesting on account of their dense, cushion-like habit of growth, frequently not exceeding two to three inches in height. T. H. Everett.

PAULOWNIA RECURVA.

In early June, Mr. John Banting, gardener to the Earl of Ducie, Tortworth, Falfield, Gloucestershire, forwarded us a box of *Paulownia* inflorescences, accompanied by the following note:—"The *Paulownia* sent is Wilson's 769; the tree was given to the late Earl of Ducie by the late Mr. H. J. Elwes, on January 8, 1911. It was about twelve inches high and was planted on the day it arrived. It has

FIG. 20.—PAULOWNIA RECURVA.

A tree of this species growing in the garden of the Earl of Ducie, Tortworth, Falfield, Gloucestershire.

CALLUNA VULGARIS.

THE Ling, or Scotch Heather, is too well-known to require any elaborate description. Throughout the country it covers large areas of moorland, common and hillside, and in the late summer it makes a glorious splash of colour in the somewhat sombre landscape.

As a garden plant it has its uses, more especially in the wilder portions, where it may be planted in large masses, while the white variety is valued for sentimental reasons.

In nature it is a variable plant, and many different forms may be found, differing from each other, both in the habit and colour of flower.

Provided the soil is free from lime, no trouble will be encountered in establishing *Calluna vulgaris*, and the only preparation necessary is deep digging of the ground and the careful removal of any Couch grass which may be present. Seeds afford a ready means of propagation for the type, but the better varieties and especially good forms should be increased by means of layers, or cuttings; these latter root readily if inserted in a cold frame during August or September, in a sandy-peat compost.

Reference to leading nurserymen's catalogues will reveal the existence of many fine named and

borne incipient flowers before, but they were not worthy of notice. This year the tree has produced beautiful flowers all over it (Fig. 20), and has been greatly admired by visitors. The beautiful blue flowers are produced before the leaves appear. This *Paulownia* is growing in 'Gibbs' No. 1 Shrubbery,' and is now thirty-six feet eleven inches high, with a girth of trunk three feet ten inches at four feet from the ground."

The inflorescences greatly resembled those of the well-known *P. imperialis* (syn. *tomentosa*), but they were far more beautiful than any of that species we have seen. On reference to *Plantae Wilsonae*, we find that Wilson's 769 is *Paulownia recurva*; the author states that the species is nearest to *P. imperialis*, from which it differs chiefly in its more densely fulvous-tomentose leaves, cordate or sub-cordate at the base, in the densely fulvous-tomentose outer surface of the calyx teeth which are not recurved at the apex and in the tomentose inflorescence. Save that the inflorescence of *P. recurva* is more imposing than that of the older species, it would be difficult to distinguish in the absence of foliage, but there can be no doubt that the newcomer is the finest from a garden standpoint, and all who have seen the flowers testify to their magnificence.

ROSE GARDEN.

ROSA HUGONIS.

THIS beautiful Rose is a native of Western China, and was first raised in this country at Kew, in 1899. It forms an attractive, spreading bush, six feet, or more, in height, its straight, regularly-branched stems being of a dark, purplish-brown colour, armed with sparsely-placed, slender prickles and numerous, short, stiff hairs.

The graceful, slender flower-bearing branches are practically devoid of prickles and hairs, and are clothed with attractive, rich green leaves, from two inches to four inches long, composed of from five to eleven oval or obovate leaflets, the margins of which are finely serrated, except near the base, where they are quite entire, while both surfaces are glabrous.

The flowers are borne singly on very short, leafy twigs, the flower-stalks being about three-quarters-of-an-inch in length; they are slender and glabrous, and about two inches in diameter, and of a rich, creamy-yellow. The petals are waved and crinkled, while the spreading, lanceolate sepals are fringed with down and slightly tinted with red.

Rosa Hugonis is one of the earliest of Roses to flower, and in mid-May was covered with a profusion of blossom. The species is quite hardy, free in growth, of pleasing habit, and very useful for planting in light soil. Its smooth, globular fruits, with the persistent calyx at the top, are of a deep, almost blackish red when ripe. A. G. F.

ROSE TRIALS AT BAGATELLE.

THE jury invited to examine the new Roses at the Rose Gardens, Bagatelle, Paris, met on June 11 at 9 a.m., under ideal weather conditions for the earlier part of the day, the morning being warm and dull, the foliage and blooms very fresh, after a gentle rain during the night. The light showed up the colours at their best.

On this occasion the Rose novelties presented in 1925-26-27 were under examination, and those of 1925 were the first inspected. The Gold Medal for the best French novelty was unanimously awarded to the variety Helen Fox, a seedling from Madame Melanie Soupert × Souvenir de Claudius Pernet; colour deep canary yellow, good long bud, flower of medium size, moderately full, with nice foliage and erect growth. This promises to be a very good variety for massing.

A First-Class Certificate was awarded to Comtesse de Castilleja, which on the previous occasion was given nine points out of the possible ten points (the highest number awarded), but at this time it was completely over, not one bloom showing. This is a very striking and novel colour—orange, flamed-vermilion, passing to golden coral; erect growth and nice foliage. It should be valuable for massing.

The Gold Medal for a variety from foreign raisers was, after a vote, given to Kardinal Piff, of flesh-peach colour, a full flower, with short petals. Shot Silk received a Certificate.

The novelties sent in 1926 came next under review, and after examination it was decided not to award a Gold Medal to any of the varieties on trial from French raisers.

The First-Class Certificate was awarded to La Mye au Roi, a seedling from Duchess of Wellington × Pax Labor, from Mons. Bernaix. Among those from foreign raisers, the Gold Medal was given to Madame Gregoire Stacehelin. This is of climbing character, semi-double and of pink shade. This award occasioned much adverse comment. Certificates were given to Marquise d'Audique and to Mevrouw G. A. Van Rossen.

The 1927 Roses were the last to be examined, and the work was done after a deluge. The awards for these will be made in 1928. In this series seventy-seven varieties were under trial, many being under numbers only. The more noteworthy of those possessing names were Thora, Francie Simms, Abol, Lady Margaret Stewart, Dame Edith Helen and Charles P. Kilham.

In addition to the Roses mentioned the following are worthy of attention, viz.: Cuba, semi-double, colour very striking and distinct;

Goudvlender (Golden Butterfly), a semi-double, golden-yellow Rose with nice buds; it should be suitable for massing, being apparently floriferous and of good habit. Mrs. Fred Howard, in the way of Madame Ravary; Alice Stern, white, shaded cream, a large and well-formed flower of good growth and habit; and Souvenir de Madame Pidoux, a very free-flowering and erect-growing variety, producing large blooms of a golden yellow colour, shaded chrome.

The condition of the growth of the Roses, more especially those of 1926-27, was far from being satisfactory; indeed, in the majority of cases, the growths were so miserable that typical blooms could not be expected. Until a different mode of culture is observed, and reasonable soil conditions provided, little improvement can be expected. The soil is not by any means what one would desire for Roses, and to make matters worse, the space allotted to each five plants is quite inadequate and the growing of grass between each lot appears to be quite wrong.

It is to be hoped Mons. Forrestier's successor will have the opportunity of effecting improvements in both this and other respects so as to make the trials and awards worthy of Bagatelle. R. N.

ROSE MERMAID.

THIS variety is a hybrid of Rosa bracteata, and is so beautiful that it is surprising it is not more generally planted. It is very suitable for furnishing a pillar, or may be grown in bush form to make a large specimen; it is also ideal for covering a fence or for training on walls. In the colder parts of the country a wall may be necessary, although, so far, this beautiful Rose has proved hardy in the open, notwithstanding, one of its parents, R. bracteata, requires the shelter of a wall in the south. C.

ALPINE GARDEN.

CODONOPSIS OVATA.

THIS quaint plant is just commencing to bloom on the rock garden, and though not of striking appearance, it possesses a distinct charm, also a distinct and unfortunately a very unpleasant odour. By planting it high up on the rockery the beauty of its blooms can be admired and the unpleasant odour not noticed. It is a low-growing herbaceous plant, producing slender, trailing stems about one foot in length, the ends of which become erect to bear single, drooping, broadly campanulate flowers. The flowers are remarkably symmetrical in their formation, the broad corolla lobes curving into sharp points, while the glabrous, green sepals are acutely reflexed. The corolla is of the palest shade of blue, delicately veined with purple, while the throat on the inside is marked with two irregular bands of purple, below which and between the bases of the stamens are five orange blotches surrounding the blackish-purple base of an exceptionally large pistil.

The leaves are ovate, about three-quarters-of-an-inch in length, slightly hairy, recurved and short-petioled, being produced alternately or oppositely along the growths to within about two inches of the flower, from which point the stem is naked, except for a small, leaf-like bract.

The plant is a native of the Western Himalayas; it is easily propagated from seeds or cuttings, and flourishes in light, loamy soil. S.A.

HOUSTONIA COERULEA.

THIS delightful little plant enjoys a moist position in the rock garden and thrives splendidly in leaf-soil and sand on a rocky ledge or in pockets between large stones. The shoots are only a few inches high; the flowers, on one-flowered peduncles, vary in colour from light blue to white; the corolla is about half-an-inch across. The leaves are ovate-lanceolate, attenuated at the base, the radical ones spatulate, slightly hirsute.

The species was introduced from Virginia so long ago as 1785, and is figured in *Bot. Mag.*, t. 370. Propagation may be effected by division or by seeds.

This pretty little plant is beautifully figured in Maund's *Botanic Garden*, Vol. V.; it commemorates Dr. Houston, who resided for several

years in the West Indies and was a correspondent of Miller, between 1728 and 1732. "Some engravings, by his own hand, of the parts of fructification of various new genera of plants, came into Miller's hands, who sent an impression of them, in 1736, to Linnaeus. Most of these plates were purchased, with Miller's herbarium and papers, by Sir Joseph Banks, who printed and liberally distributed an edition of them, with the Latin descriptions and remarks of the author, under the title of *Reliquiae Houstoianae*, in quarto, in 1781, a work which is now somewhat scarce."

The plant under notice was formerly cultivated in peat or peat and loam with marked success, and will thrive in such conditions, but I have found it eminently satisfactory planted in leaf-soil.

H. coerulea is delightfully pretty when grown in a pan, and is also excellent as a carpet to taller plants. Ralph E. Arnold.

ALYSSUM SPINOSUM.

ALYSSUM SPINOSUM is an interesting and little-grown rock plant, forming a small, spreading bushlet about six inches high. It should be planted in large drifts in sunny situations.

The foliage is silvery grey and of pleasing appearance on hot days. In early June the plants are hidden under short spikes of white flowers, the flower stems hardening into spines after the seeds have ripened.

There is also a rose-flowered form (var. roseum), which is similar in habit to the type. L. Le C. T.

HELICHRYSUM FRIGIDUM.

Of the numerous dwarf Everlastings, this species from Corsica is conspicuous in its dainty beauty, and also the difficulty which attends its culture.

It should be planted in the hottest crevice in the rock garden, in light, well-drained, loamy soil. It forms low mats of short growths densely covered with tiny leaves, which are so downy as to give the whole plant a silvery appearance.

In early summer the growths elongate and are terminated when about two inches long by single, snow-white, gold-centred blooms.

Cuttings of this plant should be rooted during July and wintered in a cold frame, while the parent plant should be protected from winter dampness with sheets of glass. Helichrysum frigidum makes a charming subject for the alpine house. A. G. F.

BULB GARDEN.

PUSCHKINIAS.

I WONDER that more amateurs do not cultivate some of the uncommon hardy bulbous plants of which the Puschkinias may be included, for they have a fairy-like grace which endears them to the lover of the smaller bulbs. Those who grow Scilla sibirica, for example, may well procure a few Puschkinias and plant them in front of the border, in the rock garden, or in pots, for the decoration of the home or the conservatory.

They are delightful little plants, only about six inches high, and having exquisitely coloured flowers of porcelain blue with deeper coloured lines. They vary a little in colour and some are white in their ground colouring, prettily lined with blue. There is some confusion as to whether P. scilliodes or P. libanotica are synonymous or not, and they are frequently classed as such in nurseries, but the point is really immaterial, and any Puschkinia, bought as P. libanotica or P. scilliodes will give pleasure. There is a densely-flowered variety, listed as P. libanotica compacta, but I do not care for it. These Puschkinias flower in early spring.

Bulbs, which are not expensive, may be ordered now or in early autumn, and planted so soon as they arrive, at a depth of about an inch in heavy soil, and two inches in light ground. They do best in light soil and bloom early in a sunny position. Half-a-dozen bulbs in a six-inch pot are very pretty when in flower. The pots should be plunged outside until growth commences, when the plants may be taken indoors. S. Arnott.

ROCK GARDENING.

NOWADAYS the rock garden or alpine garden forms part of almost every private and public garden in every town of the United Kingdom, as well as in the United States of America, Canada and other English-speaking countries. On the continent it is not so universally adopted, but is popular, specially in the northern countries.

I quite remember, in 1877, being a young man and wishing to extend the culture of alpine plants, I ventured to put up an exhibit of alpine plants before the Société d'Horticulture de Genève. The Judges and Committee were surprised. They considered these wild plants as weeds and jocularly said: "*Jardin alpin—Herbe à lapin!*" The judges were rather perplexed to know how to treat the small collection and were of opinion it was not worth an acknowledgment, but one of the members of the Committee said: "Give him something in order to prove the interest the Society shows to young beginners, who must be encouraged." and they gave me four little silver spoons!

The day after, the *Journal de Genève* had a nice little note about my plants; the Editor was the first to appreciate this small attempt of mine to acclimatise alpine and introduce them to the horticultural world. How rapid was the success that followed every one may see who has visited our Swiss gardens and also understands the importance the culture of alpine has attained in England during the past half-a-century. Mr. William Robinson did a great work in popularising natural gardening and the cultivation of alpine. My countryman, E. Boissier, the author of the *Flora orientalis* and of the *Flora of Spain*, was one of the first to take part in this movement, as he constructed a rock garden at Valleyres-sur-Orbe in 1850, probably the first of its kind on the continent. This was a great help to him in describing the plants he brought from various countries. He brought home plants or seeds and published many of his descriptions from these cultivated plants. But he did not "grow" alpine; his object was strictly scientific.

Alpine gardens built in the Alps *in situ* in the mountains are still younger; the first was founded at Bourg-St. Pierre, near the Great St. Bernard, and its object was firstly to help the scientific studies of Professor Romanes of Oxford, who asked the writer to help him with observations we could not undertake in our alpine garden. The Linnean garden was founded in 1889 and belonged to us till, during the war, in 1917, we gave it to the University of Geneva, who made there a laboratory for students of botany.

I was rather surprised, last year, during a tour I made in the United States of America to find so much enthusiasm for alpine flowers and rock gardening.

Lately I received a reprint of a note from a medical journal*: "The building of the rock garden in itself makes demands upon special faculties. A knowledge of the primary laws governing the growth of rock plants as to their individual soil preferences—calcophiles or calcophobes—is necessary; the arrangement of soil and rocks with reference to drainage and aesthetic effects is an art of no mean value; and above all the ability to make plants look natural and happy in an artificial reproduction of their environment may be either inborn or ultimately acquired after much experience of trial and failure. With some individuals it is a primal instinct. The collecting of new varieties means an increased interest in botany and floriculture, and in the geographical distribution of plants. As one grows in grace and in knowledge the creative desire develops, and the rock-gardener turns to the thrilling possibilities of selection and hybridisation. A new passion is born out of the old, and the remaining years of life are all too few for the sowing of seed produced by crossing and the determination of the results.

And should a worthy new variety result—well, it is a victory worth a whole lifetime of effort! In this ultimate phase of the sport of gardening the highest thrills of a gambling game may be experienced. Finally, the literature of rock-gardening offers an abundant library, for winter and in-bed reading. The stories of plant collecting in the distant and out-of-the-way places of the world are as thrilling to the rock gardener as big game stories are to the hunter."

"Perhaps an explanation of the perennial youth of the man who preaches the culture of alpine plants can be found in his lifelong interest in alpine gardening. There are many other accounts of individual experiences in rock gardening that may be added to this library of literature on this subject, but they will ultimately be discovered by the adventurer

HARDY FLOWER BORDER.

SCUTELLARIA BAICALENSIS.

THIS plant is the most handsome of the Skullicaps, and suitable alike for the rock garden or herbaceous border. It has been in cultivation since 1848, but has never become common owing, no doubt, to its habit of dying out during the winter.

It is a native of East Asia, and is sometimes termed *S. macrantha*, under which name it was illustrated in *Bot. Mag.*, t. 4,420. The plant is a perennial, and forms compact, bushy specimens with semi-erect, upward-branching stems, about one foot high; the stems are clothed with rich green, lanceolate leaves, the upper ones being smaller and narrower than the lower ones.

FIG. 21.—PHLOX ARGILLACEA.

R.H.S. Award of Merit, July 5. Flowers pale lilac. Shown by Mr. T. Hay, Hyde Park.
(see pp. 38 and 51).

in this field. We have mentioned rock gardening first in our contemplated category of recreations for physicians, because it seems to us to combine all the essential features of a perfect hobby; its satisfaction to the creative and inquiring mind, the pursuit of scientific knowledge, aesthetic appreciation, contact with the soil, physical exercise, life in the open, travel and literary appreciation. These interests, so manifold and varied, constitute a field so limitless in extent that all of the spare time of one's whole life might be expended in it without any possibility of exhausting its possibilities. Its cerebral stimuli are so different from those of the practice of medicine that frequent reaction to them, if only for a relatively short time, leads to that more perfect mental catharsis which is the aim of all forms of recreation."

I think this experience of the American author who is a professor of medicine is an encouragement for alpine gardeners, and I venture to place it before the readers of *The Gardeners' Chronicle*. Henry Correvon, Geneva.

The flowers are produced in closely-packed, terminal spikes during July, the erect, rich purple corollas being kneed (geniculated) at the base of the tube. The large hood of the corolla is incurved, while the broad lower lip is flat and notched.

This *Scutellaria* is quite hardy and grows freely in any good garden soil, while a stock of it may be raised from cuttings inserted during late July or August.

SCABIOSA GRAMINIFOLIA.

In a sunny position and in light, well-drained soil, this lovely herbaceous plant from the Southern Alps will flower throughout the summer. These flowers are of a rich lilac colour and are borne at the tops of slender, downy stems, from six inches to twelve inches high, rising above clumps of long, narrow, pale green leaves, both surfaces of which are clothed with silvery down, which silveriness, combined with the soft colouring of the flowers, imparts to the plant a very dainty appearance. A. G. F.

*Annals of Clinical Medicine, Vol. V., Sept., 1926.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand." or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

THE TWO LABURNUMS.

IN Garden Notes from South-west Scotland (*Gard. Chron.*, June 18, p. 429), Sir Herbert Maxwell calls attention to the sparse flowering of the Laburnum this year. Cumberland has had the same disappointing experience. At any rate, I can hardly recollect such a miserable production of bloom as we have had here this spring. Failure, however, has not been universal, for I happened to see in a Leeds suburban garden some Laburnums during the flowering season and they were literally smothered in bloom—too much so, in my estimation, from the aesthetic standpoint. A Laburnum in the open is often a mass of flowers. In partial shade the blooming is less overwhelming, but more effective, with each raceme individualised and lengthened through less light; for the great beauty of the Laburnum lies in the length of the raceme:—

"Where the drooping light Laburnums
Scattered gold through leafy gloom."

In the character of its flowering the Laburnum is only surpassed by the Wistaria, but this choice Papilionaceous shrub needs more warmth than we can give it. Except in favoured seasons and in snug corners, little bloom may be expected from it in the sun-shy north-west. Not so with the Laburnum; it rarely fails to enliven our shrubberies, walks and woods in the month of May with its golden rain.

The ease with which it may be grown and its familiarity, perhaps, make us appreciate it less than we should, and prevent our planting it for the best effects. The Laburnum has, however, certain defects. When not in bloom there is nothing particularly attractive about it, whereas the Wistaria is worth growing for its handsome foliage alone. This can hardly be conceded to the Laburnum. Potentially, its leaves should gleam with gold in the autumn, but they rarely do so effectively, probably owing to the ravages they suffer from the leaf-mining caterpillar of one of the microlepidoptera. Extra weakening from a bad attack of this moth may account at times for a meagre display of bloom the following spring? This pest is annoying in two ways. It not only makes the Laburnum unsightly in the summer, but passers-by at this season of the year are apt to become entangled with the caterpillars as they descend by their threads to pupate in the ground. Where the pest is rife one would hesitate for this reason to plant a pergola or an arch of Laburnums over a much frequented path.

The lay person in matters horticultural probably does not sufficiently realise that there are two distinct species of Laburnum in cultivation. They are so alike as not to be readily distinguished except by the observant. The one more usually seen is the Common Laburnum (*L. vulgare*), and is, without doubt, the more desirable tree. But the other, the so-called Scotch Laburnum (*L. alpinum*), has one merit. It flowers two or three weeks later, so by planting both kinds the flowering season of the Laburnum can be extended. Also without it we should not have had the most beautiful of all Laburnums, *L. Watereri*, which is a natural hybrid between the two species and surpasses both in

A microscopical examination made the reason clear. The outer walls of the upper epidermal cells of the leaf of the Scotch Laburnum are nearly flat, giving an almost smooth surface, hence the glossiness. On the other hand, those of the Common Laburnum are convex, thus causing a roughening of the surface, and hence a mat appearance. Other interesting differences in the structure of the two leaves revealed themselves. The palisade tissue of the mesophyll is more strongly developed in *L. vulgare*, and the side walls of the lower epidermal cells are straight, while those of *L. alpinum* are a little wavy. Judging from these structural features, according to current interpretations,

FIG. 22.—PRIMULA WALTONII.
(see p. 51).

wealth of bloom and in length of raceme. It can, of course, only be propagated artificially.

The two species are easily recognised by differences in their foliage. The Scotch Laburnum has shiny, stiffer-looking leaves (leaflets), contrasting with the softer, non-glossy and more refined foliage of the Common Laburnum. A closer examination with the help of a lens shows that *L. alpinum* is nearly glabrous throughout. A few scattered hairs may be discerned on the stem, leaf-stalk and midrib. The Common Laburnum, on the other hand, is almost pubescent throughout. The numerous and closely adpressed hairs give a silvery appearance to the young stems and pods, as well as to the lower surface of the leaves. The hairy covering is, however, absent from the upper surface, and yet it is not shiny as in the case of *L. alpinum*, but dull. Why?

the former would appear to be better adapted to withstand dry conditions than the latter. How about their natural distribution? Both belong to the alpine region of Europe. *Laburnum alpinum* is said to ascend to higher elevations than *L. vulgare*. Is it found more frequently than the Common Laburnum in districts of heavy rainfall or in wet situations?

Besides foliar differences, there are others to be noticed between the two species. The dark streaks (honey guide) on the standard petal are considerably more marked in *L. vulgare*, adding to the beauty of the individual flower. The blooms of *L. alpinum* are on the whole smaller and deeper in colour (at any rate, in my specimens), and its pod is somewhat winged and ripens fewer seeds.

One wonders at times when evolution by sudden jumps in one direction (mutation)

is advocated whether sufficient attention is given to such pairs of closely allied species, where the differences are slight but manifold. Among shrubs and trees familiar to us besides the Laburnums one might mention in this connection the two Hawthorns (*Crataegus Oxyacantha* and *C. monogyna*) the Cherries (*Prunus Oxyacantha* and *P. monogyna*), the Birches (*Betula verrucosa* and *B. pubescens*) and the Oaks (*Quercus pedunculata* and *Q. sessiliflora*). *J. Parkin, Blaithwaite, Carlisle.*

from Singapore, as well as that in the herbaria at Kew and at the Natural History Museum, South Kensington, and he has taken a great deal of trouble in comparing these with the material taken from my plant. He tells me that the Singapore specimen is not *C. amabile*, whatever else it may be, while he is convinced that my plant answers exactly to the description and dried flowers of the plant described early last century as *C. amabile*. This plant is said to be of Sumatran origin, and to have been in cultivation in this country over one hundred years ago.

So far, there is nothing extraordinary about

country—if so, I should be glad to hear from anyone who has it in his collection, and to learn its origin.

C. amabile may be a natural hybrid—I could not induce it to set seed, although I crossed it with other *Crinums*. It has, however, made a number of offsets, one of which I intend to try out-of-doors in a warm, sheltered corner, to test its hardiness.

C. amabile is a large *Crinum* with a scape about three feet high bearing a large number of fragrant flowers of a beautiful creamy-white, marked with purple lines. *Albert Pam, Wormley Bury, Broxbourne.*

PLANTS NEW OR NOTEWORTHY.

PRIMULA WALTONI.

THE enclosed photograph (Fig. 22) shows *Primula Waltoni* (K.W. 6094) growing in my garden in Perthshire. This I consider one of the prettiest of the wonderful collection of *Primulas* found by Capt. F. Kingdon Ward in Tibet in 1914. My plant was raised from seeds sent home by him and has flowered this summer. The flowers are a wonderful deep, glossy, ruby-red colour, powdered inside with white meal and unusually large, measuring one-and-a-half inch across. *Andrew Harley, Blinkbonny, Kirkcaldy.*

PHLOX ARGILLACEA.

IN 1911, two American botanists, Mr. W. N. Clute, Editor of the *American Botanist*, and Mr. J. H. Ferriss, made a critical examination of the many species of *Phlox* which are to be found in the States of Illinois and Michigan, the result of their conclusions being published in volume seventeen of the *American Botanist*.

It had long been known that under the name *P. pilosa* there were grouped two plants which though showing only slight botanical differences were quite distinct in their period of flowering and decorative value. To the better plant was given the name *P. argillacea*, from the fact that it preferred the heavy clay lands. Under cultivation *P. argillacea* proved a fine garden plant, and in 1924 Mr. Clute sold the stock to Messrs. Meehan and Sons of Germantown, Philadelphia.

The species has become very popular in American gardens, photographs having been published showing huge plants with over one hundred flowering stems. In the States, the rich yellow colouring of the foliage in the late autumn has also been favourably commented on.

In the spring of 1926, Mr. Clute kindly sent me seeds of this *Phlox*, and the resultant plants (Fig. 21) are now in flower. In the open border it reaches a height of about fifteen inches, throwing up many flowering stems, which branch, and carry large quantities of small, silvery-white flowers. It is a pretty and attractive plant (see p. 38), easily grown, and may be quickly increased from seeds, cuttings, or by division. *T. Hay, Hyde Park.*

CRINUM AMABILE.

ABOUT five years ago, I received from Peru a consignment of bulbs, and among them one which was evidently a *Crinum*. I grew this on—it was much withered on arrival—and it flowered for the first time last year. I sent the plant, which by then was very large and growing strongly, in a sixteen-inch pot, to one of the Royal Horticultural Society's fortnightly meetings, and it was given an Award of Merit as *Crinum* sp. ? (see p. 97, July 31, 1926).

A flower and leaf were sent to the Natural History Museum, South Kensington, for identification, which was kindly undertaken by Dr. Rendle. It was soon decided that the plant was neither *C. concinnum* nor *C. erubescens*, as had been suggested, while Dr. Stapf thought that it might be *C. amabile*; as this plant was reported to be growing in the Singapore Gardens, it was decided to await the arrival of a flower and leaf from those gardens before giving a final opinion.

I have now heard from Dr. Stapf that he has had an opportunity of examining the material

FIG. 23.—*ONOSMA HOOKERI*.

R.H.S. Award of Merit, July 5. Flowers blue. Shown by Lt.-Col. Messel. (see p. 38).

the determination of this plant; the curious coincidence, however, is that the plate *Bot. Mag.*, 1,605, so Dr. Stapf informs me, was prepared from a plant grown about 1812 in Wormley Bury, which is now my own garden! After 114 years, the same rare plant appears again in the same garden, this time coming from a country thousands of miles from its native home! How it got to Peru is a mystery; whether it was found there in a wild state or taken for me from a garden, it is now impossible to trace. Dr. Stapf informs me that it has been reported as having been introduced into South America and the West Indies: it may still be in cultivation somewhere in this

OENOTHERA CLUTEL.

THIS fine Evening Primrose was discovered by Mr. Willard Clute when botanising in the Navajo Indian Reservation territory, Arizona, in 1919, and along with other new plant species found there, has been described by Nelson.

In the spring of 1926, Mr. Clute kindly sent me seeds which germinated freely. The first year the plants formed the usual rosette of crown leaves and made no attempt to produce flowering stems. It proved perfectly hardy, remaining green and healthy all through the trials of a London winter. This year the plants began to grow early, sending up a thick

central spike, four feet in height, with many less stout, basal branches, the whole forming a very handsome plant.

The flowers are large, often four inches across, of a lovely soft yellow, borne in immense numbers, a mass of this plant producing a glorious effect. Although at its best in the evening, *O. Clutei* is much more attractive during the day than many species, as the flowers do not close altogether.

O. Clutei is probably a biennial, and according to Nelson, its nearest relative is *O. Jamesii*, but it is easily distinguished from that species by its precocious crown branches, its central stem and calyx-tube, its large, handsome flowers and remarkably short seed capsule. *T. Hay, Hyde Park.*

HORTICULTURAL WATER SUPPLIES.

It is now recognised in Public Health circles that the provision of an adequate and pure water supply largely determines the health of the community. This recognition has come about as the result of research work which has disclosed the fact that many diseases to which man is subject are water-borne. This again led to the discovery of various methods for sterilising water whereby it is now possible to ensure a supply free from injurious organisms and suitable for human consumption.

The subject of water-borne diseases which affect cultivated plants is of no less importance, and is one which has received attention within the last few years; its importance is probably more related to the growth of crops under glass than in the open. The fact that water may act as a carrier and disseminator of the spores of certain diseases has been established, and where disease runs riot from apparently inexplicable causes, the water supply should be examined biologically. According to Bewley and Buddin, their attention was directed to this important question as the result of a severe epidemic of "damping off" disease in the early part of 1919, and later, in the same year, a similarly severe attack of "buck eye" rot.

Generally speaking, and considered from the point of view of contamination, stagnant brooks are really natural sewers. As shallow wells receive the drainage from the neighbouring land, it is quite possible that such land, if infected with, for instance, "*Phytophthora*" disease, may contaminate the well water, and if this were used on Tomatos it is possible they may become infected. Tanks or wells in which green algae or weeds are growing may easily be contaminated with disease organisms. Deep, artisan-well water is considered purest and safest. Water to which drainage has had access should also be viewed with suspicion, as the spores of certain diseases are known to pass uninjured through the intestines of animals.

Infested refuse of all kinds should be destroyed by burning, as the spores may be washed down into the soil, and subsequently find their way into streams, brooks, surface wells, etc. Water tanks should be periodically cleaned out as a precautionary measure and disinfected. The addition of such a substance as potassium permanganate to the water storage at the rate of 4 lb or 5 lb per 1,000 gallons of water is to be commended as a commercial proposition.

Water supplies may also act as a carrying medium for nematode worms (eelworms) and their eggs, and once these gain entrance to a Cucumber or Tomato border, sterilisation, either by heat or chemicals, is the only reliable method for ensuring complete eradication.

INFLUENCE UPON SPRAYING.

In all wet-spraying operations water is used as the carrying medium, and consequently the nature and character of the dissolved salts it contains will depend upon the source of supply. In turn, these dissolved salts will greatly influence the spreading and wetting power of the spray fluid as well as the actual insecticide used, and also determine the extent of subsequent pump and nozzle trouble.

Rain and soft water are the best to use for spraying purposes, but, unfortunately, an adequate supply of either is not always available, hence it becomes necessary to use one or other of the following types, depending upon situation and locality, viz., river, stream, or surface water drained from cultivated land, shallow and deep well waters. The amount of hardness in each will depend upon the type of land drained, and the nature of the subterranean passage through which the water has to travel.

Generally speaking, river and stream waters are comparatively soft, but in chalky districts the water may be very hard. In shallow and deep well water there is a great variation in hardness. The use of either must be determined by the results of a chemical analysis; indeed, before any supply of water is used for such an important operation as spraying its composition concerning hardness and dissolved saline salts should be known.

Undoubtedly, many thousands of pounds are wasted annually through inattention to this point, by the formation of soap scum, by time wasted in releasing choked pumps, nozzles, etc., and ineffective results. The success obtained with any spray fluid depends almost entirely upon its spreading and wetting powers, other factors being equal; water by itself is a poor spreader, but when it contains dissolved hardness in the form of lime or magnesium salts, its power of spreading is further decreased. Hence it is necessary to overcome this resistance by the addition of soap or some other suitable substance.

When soap is used with hard water a scum is produced, and this scum will continue to be formed until all the hardness has been removed, so long as there is sufficient soap present. In other words, the soap is used up in softening the water.

METHODS OF REMOVING OR OVERCOMING HARDNESS.

There seems little doubt that it would pay growers, where large acreages are concerned, to adopt some form of water-softening treatment in districts where the water is particularly hard. In fact, in the Worthing district many growers under glass experience much trouble in pipe-blocking as a result of the hardness separating out in the boiler tubes, and the periodical replacing of such must be an expensive business.

There are various methods actually in vogue for water softening, the most expensive item being the provision of a settling tank of large capacity. The main object aimed at in most methods consists in the removal of the hardness in the form of a "chalky" sludge which settles at the bottom of the tank leaving the water in a suitably "soft" condition.

The previous methods are termed "chemical" because various materials, such as washing soda, milk of lime, etc., are used to throw down the hardness by a process of chemical re-action.

OTHER METHODS.

In the United States and Canada much attention has been devoted to other materials than soap to increase the spreading and wetting properties of insecticides; these have been given the name of "spray spreaders." They do not remove any hardness from the water used, but by a complex physical process are able to overcome the natural resistance of the leaves, pests and water, and so increase the covering power of the wash, and at the same time secure the maximum effect of the insecticide used. Substances such as milk, soluble caseinates, saponin, starch paste, etc., are all examples. In addition these materials possess the advantage, which soap does not, of forming compatible mixtures with most insecticidal and fungicidal ingredients.

For example, soap is not to be recommended for use with arsenates, lime-sulphur and copper sprays, on account of the risk of chemical re-action taking place and the production of substances which would be deleterious to the plants. High pressure at the spray nozzle is, of course, an important influencing factor on the success of spraying operations, in overcoming

the resistance, in conjunction with the spreader. This should be in the neighbourhood of 100 to 150 lbs. per square inch.

A fact worthy of note is that when using lead arsenate it is not wise to have too good spreading, otherwise the "lead" runs off and accumulates on the edges of the leaf surface. A fine mist spray should be used for stomach poisons and fungicides, and a coarse nozzle for contact and cover washes.

Where the water supply is entirely unsuited to spraying purposes, such as in some parts of the Wisbech area, it might be well to seriously consider the adoption of dry-dusting methods, although this method is not to be advocated when the application of arsenate of lead is concerned. For the control of sucking insects and even young caterpillars, it is well worthy of trial, because, although perhaps the initial cost is compensated for in the saving of time and labour and water cartage, if properly carried out, dusting is superior in many respects to wet spraying, provided always that such dusts contain a high enough percentage of a recognised active ingredient, such as nicotine, or its equivalent in the form of nicotine sulphate. Where the sulphate is used either as a wash or incorporated in a dust, such as gypsum, etc., it is essential to have a suitable chemical present which will cause the decomposition of the salt in sufficient quantity to completely liberate the nicotine.

In districts where the only water supplies available for spraying contains large quantities of salt, such as certain districts in Cambridge-shire, it is absolutely impossible to use any form of soap with nicotine. Hence growers are compelled to fall back upon spray spreaders or adopt dusting methods.

There are two important spreaders worthy of special mention, viz., sodium caseinate and common size. The former is prepared by boiling ordinary fine-powdered milk casein with caustic alkali. This is not altogether a pleasant process, and can really only be considered for use on a large commercial plantation. The writer has found recently that ordinary dried milk at the rate of 1½ lb to 3 lb per 100 gallons of water, can be used with practically all the standard insecticides and fungicides without forming what is technically known as an incompatible mixture.

The use of calcium caseinate has been advocated extensively, both in the United States and here, until comparatively recently; it is made by grinding together a mixture of hydrated lime and milk casein, seventy-five per cent. of the former to twenty-five per cent. of the latter. This is usually mixed into a thin cream with water, using 2 lb., and diluting this down with water to 100 gallons. It is an excellent spreader but it possesses this distinct disadvantage, that it is liable to cause considerable trouble by clogging the spray nozzles if used in conjunction with water containing much bicarbonate of lime.

The lime in the calcium caseinate in reacting with the bicarbonate forms chalk, and in so doing the casein is also thrown out of chemical combination in the form of a gelatinous scum, with the result already mentioned.

Another phase of spray spreaders is of interest, quite apart from their influence in increasing the wetting and spreading of a spray fluid, namely, the effect they have on suspensions in water of arsenate of lead and Bordeaux mixture. It is well-known that when using, for example, arsenate of lead, it is necessary to keep the spray well agitated in the spraying machine if an even distribution of the poison over the leaf surface is to be obtained.

Woodman has found that by dissolving ordinary size or glue in hot water and diluting this down so that the ultimate mixture contains about 1½ lb of glue in forty gallons of water, it is possible to maintain an arsenate suspension, thereby eliminating the necessity for violent agitation; and, at the same time, this material is not washed off the foliage by subsequent rains, and therefore greatly assists the adhesion of the arsenate to the foliage, indirectly increasing the efficacy of the poisonous deposit, as well as aiding in its economical use. *Theodore Parker.*

THE SIMPLE CONTRACT.

HARDLY a day can pass but that a contract in some form or other has been made by those who read these pages, and in order that the full benefit may be gleaned from these contracts three things must be understood by the parties to them. The first is how a contract should be made, the second the legal effect and force a contract has, and the third the remedies for a breach or breaking of a contract.

In the first place, all contracts consist of two distinct parts, (a) offer and (b) acceptance, and without these two no contract can be effectually arrived at, and though at times both do not appear to exist, every contract springs from the acceptance of an offer.

An advertisement in a seedsman's catalogue is an offer to all the world (or at any rate, to those people to whom he sends his catalogue) to sell his seeds at such and such a price, and when a gardener writes for a certain quantity of seeds he is accepting the offer made by the seedsman, that is to say, it constitutes offer and acceptance.

Contracts such as the above are examples of the general rule and are comparatively simple, but those contracts which are rather exceptional than general are the most frequent cause of trouble to the parties making them. Let us consider contracts made through the post; here the rule is that an acceptance dates from the time the letter is *posted* (not the time when it arrives), while if on the other hand it is desired to revoke an offer, revocation dates from the time it is brought to the notice of the person to whom the offer has been made (not from the posting of the letter).

Thus, if A writes to B offering him some plants at £5, and B on receipt of the offer writes and accepts, although A sends a telegram to B which arrives before B's letter reached A, a contract will have been made, and A must hand over the plants on receiving £5.

Another point of interest is the rule that a counter offer acts as a refusal of the original offer. This becomes important where an article is offered at, say, 20s., but the person to whom the offer has been made writes and says he will not take it at 20s., but will give 17s. 6d.; should this counter offer be refused, there is no right to compel the other party to sell at his original offer of 20s., since by making a counter offer the original offer was refused.

Then again, there is the rule by which the person making an offer cannot saddle the person to whom it is made with the obligation of communicating his refusal of the offer. Thus, where, as sometimes happens, A writes to B, with whom he has been trying to arrange a purchase: "Unless I hear from you further, I shall consider the tree's mine at £5. . ."; should B fail to reply to A—in consequence of the above rule—the latter cannot prove that a contract has been made, all he can show is that he has made an offer, he cannot show that his offer has been accepted.

In order, then, that a contract may be completed, there must be an offer and an acceptance, and when once an offer has been accepted there can be no recanting, for if, after acceptance, one of the parties refuses to carry out his share of the agreement, this amounts to a breach of the contract.

Where a man has suffered some loss through breach of a contract he can sue the other party to the contract for damages as compensation for his loss; in the case of sale of goods this is generally the difference between the price of similar goods at the time of the contract and at the time of the breach. If the contract was for the sale of something which could not be bought in the ordinary markets, and the loss of which could not be properly calculated in money, then the injured party might obtain what is known as "specific performance," that is, the Court will order the delinquent to carry out his bargain.

This kind of redress is, however, rarely met with, except when dealing with land, when it is the usual remedy. *Harold Sharman.*

FLORISTS' FLOWERS.

PINKS.

THE time has arrived when the work of propagating Pinks should be undertaken, for if the work is deferred until the plants pass out of bloom, the cuttings and pipings will become hardened. Where large numbers of plants are to be raised, they are best propagated in shallow cases furnished with lights. A well-drained position should be selected on which to stand the cases, and if on ash base, so much the better. Cases stood on ashes should contain about four inches of light, sandy soil.

The soil should be firmly pressed down with a board and about a quarter-of-an-inch of silver sand spread over the surface. In propagating it is a mistake to pull out young shoots from stock plants for "pipings," as some growers do. The better plan is to make cuttings of an average of about two inches to two-and-a-half inches in length, and to cut the base straight across close up to, but just under a joint. The base should be cut across between the leaves. This work should be done with a sharp budding knife so that the cut is made quite clean.

The soil and sand should be well-watered three hours at least before dibbling in the cuttings. The base of the cutting should be pressed into the sand that falls in when the hole is made. This will cause a few of the sand grains to enter the cross cut and encourage the cutting to strike quickly. When the cases are filled with cuttings, give the latter a good watering and after the superfluous moisture has drained away, put on the lights. If the cases are in a position where there is much bright sunshine, shade them and keep them close for ten days or so. Afterwards remove the lights and go over the cuttings carefully, making firm, by pressure with the fingers, any loose soil around them. If the soil is not firm at the base, the cuttings will be slow in rooting. *G. B.*

NEW SWEET PEAS.

THE business of raising distinct new Sweet Peas is becoming increasingly difficult. New colours are hard to find and improvement of the existing colours is a slow process. Judged by the Sweet Peas in the National Sweet Pea Society's Trials—admirably conducted this year by Mr. E. R. Jones, at Messrs. Sutton and Sons' Trial Grounds, Reading—there are few outstanding new sorts, while advances in colour shades are not numerous. Nevertheless, judged by the experience of many years and remembering that only twenty-seven years have elapsed since the first "Waved" or "Spencer" Sweet Pea came before the public, this popular annual flower has made advances in form and colour beyond all expectations.

The Floral Committee of the N.S.P.S. granted two Awards of Merit only, as a result of visits to the Trials on July 1 and July 8, as follow:

AWARDS OF MERIT.

The Prince (Trial No. 37).—A bold crimson variety, carrying large, shapely flowers on long stems. The variety grows well and appears to lend itself to the modern method of cultivating exhibition blooms. This new variety is somewhat like Sybil Henshaw, and as seen in the Trials may be regarded as superior in form and solidity of colour. Shown by Messrs. IRELAND AND HITCHCOCK.

Trial No. 84.—This unnamed seedling is of clear and effective colouring and will no doubt be classed as "cerise (scarlet)." It is distinct from any variety with which it could be compared at Reading, and was reserved for the Society's Gold Medal, which means that if it comes true in next year's trials, the Gold Medal will be awarded. Shown by Messrs. E. W. KING AND CO.

OTHER GOOD VARIETIES.

Mrs. A. Searles, the variety sent to the 1926 Trials by Mr. Damerum and then reserved for the Gold Medal failed to secure this high award, as it contained a colour rogue. Its

brilliant colouring, however, has commended it to many Sweet Pea lovers, and all who saw it in Messrs. R. Bolton and Son's stand at the N.S.P.S. exhibition admired it greatly.

Pinkie, from Messrs. C. C. Morse and Co. (Trial No. 59), is a clean, bright pink variety of great promise and one that should prove useful for the garden as well as for exhibition.

Messrs. Bolton and Son's "No. 2" is a beautiful blue variety of which more is sure to be heard and seen. Messrs. Thos. Cullen and Sons' Blue Boy is also good in the blue class. Mr. J. Stevenson had a pretty and bright cerise pink sort in his Trial No. 17, while Trial No. 22, a light cream-pink variety from Messrs. Ireland and Hitchcock found many admirers. In the deep cream pink group, Messrs. C. C. Morse and Co. have a very pleasing variety—Trial No. 33—and their No. 35 is also good and a trifle brighter in hue. No. 51, Exquisite, from Messrs. Thos. Cullen and Sons, is a very pleasing shade of lavender. A salmon-pink variety from Messrs. W. Atlee Burpee and Co. (No. 81) promises to be a good sort for garden decoration.

Visitors to the Trials were pleasantly surprised at the extent of Messrs. Sutton and Sons' own trials of Sweet Peas, and equally with their extensive and skilful cultivation of flowers for exhibition. The plants in the firm's early, autumn-sown trials were wonderfully fine, strong, and smothered in flowers, and demonstrated the desirability of sowing the N.S.P.S. Trials earlier than has been the practice hitherto. *C. B.*

THE GOLD-TAIL MOTH.

(PORTHESIA SIMILIS, FUES.)

THE pretty larvae of this moth is very common at the present time, so common that it is doing a lot of damage to various fruit trees and also in the wild garden amongst Roses. Normally, the host plant of the Gold-Tail Moth is the Whitethorn (*Crataegus oxyacantha*), but it will eat the foliage of many other trees and shrubs. In several cases examined this season it has been noticed that when this pest is present feeding upon a Whitethorn hedge, if there happens to be a lone Rose bush in that hedge it is covered with the larvae of the Gold-Tail Moth, and hardly a leaf remains. When this occurs it looks as if the pest prefers Rose foliage to Whitethorn. This season, in the wild garden, Roses, both species and varieties, are being badly attacked, while in the fruit plantations Plums, Apples and Pears are also being damaged by the pest.

The life history of the Gold-Tail Moth is as follows: The moths appear in July and August, according to the district, they fly mainly during the evening and at night, and after pairing, eggs are laid upon the foliage of the host plant. The eggs are round, slightly flattened, and covered with the golden hairs from the anal tuft of the female; the incubation period is about ten days. The larvae are black, marked with red and white and very hairy; they feed together for a time and then separate and spread themselves over the host plant. Late in the autumn the small larvae seek winter quarters, hedge bottoms, fences, moss on trees and old sack bands being favourite positions. When a suitable position is found they spin cocoons of a dirty grey coloured silk, and they remain within these cocoons in a dormant condition throughout the winter. Many of the winter cocoons are often to be found close together within the same shelter. At the time when the foliage of the host plant is beginning to appear in the spring the Gold-Tail larvae leave their winter quarters and start feeding, and they are fully fed in June and early July, when they pupate in cocoons, upon the twigs of the host plant. The moths emerge about twenty-one days later.

In the districts where this moth occurs much damage is done to the plants mentioned. The damage is, perhaps, most noticeable upon cordon Pears, Apples and Roses. The moth appears to be rather local, but is extremely common in many districts where Whitethorn

abounds, and in such places is liable to favour the garden with its attention.

The controls used against this pest are: (1) Destruction of the winter cocoons; all plants that have been attacked should have the old tying material removed and burned during early winter. On fruit trees a hay band placed in position during September would appeal to many of the larvae seeking winter quarters. (2) Spraying with a reliable nicotine wash early in the season would control this pest as well as the larvae of winter, tortrix and other moths. (3) On Roses, handpicking is generally sufficient, but it should be remembered that the hairs of the larvae of Gold-Tail are liable to cause painful swellings on the hands. Some persons can handle this pest without injury to the hands, but if any part of the face is touched with the hands before being well washed a bad rash on the face results. *Somerset.*

MARKET FRUIT GARDEN.

IF "a dripping June puts all things in tune," the remainder of the summer ought, indeed, to be all that could be desired. The rainfall at my place amounted to 4.38 inches, which is three inches over the average for the month. Thus the long drought was effectually broken at last, and prospects for several important crops have improved in consequence. Bush fruits were greatly revived, Black Currants in particular showing a much better crop than at one time appeared likely. Unfortunately, the almost continuous rain of the last week of June hindered picking, and there is now danger that some of the fruit will get over-ripe. Apples have swelled well and, with me, are a heavy crop, many varieties requiring thinning. So far, most of the fruits are of excellent quality; but I am rather afraid that, after so much rain, scab may spread rapidly. There is enough evidence amongst my trees to show that scab disease would have been serious if no spraying had been done. The control, so far, is very good; but even now there are more slightly-scabbed fruits than I care to see. Curiously enough, Worcester Pearmain, which is usually one of the most scabby varieties, is remarkably clean this season, even on unsprayed trees. Bramley's Seedling, on the contrary, which used to be little troubled by the disease, is now bad in this respect, as most growers are finding. However, I have no cause to grumble, as I seem likely to have a crop of Apples as heavy as that of 1925, and of much better quality. These and Black Currants are almost all I have to depend on, as Plums are practically confined to Rivers' Early Prolific and Czar, both of which carry heavy crops.

CULTIVATION AMONGST FRUIT

The more I have to do with bush fruits the more convinced I become that root disturbance must be avoided at all costs. This year, cultivation amongst my Black Currants is almost a disgrace. The land was too wet to touch in March; and then it dried so quickly and became so hard that implements and hoes had little effect on it. Mere scratching to kill weeds was really all that could be managed. Yet the bushes came through the drought well and are looking better now than I have seen them for some years. This may be attributed chiefly, I think, to the fact that no forking was done in the winter. The weeds were hoed out of the rows in the late autumn, with a little of the soil, manure spread in the hollow so formed, and one shallow furrow ploughed on each side of the row to throw a little soil up to the bushes and cover the manure. Where the bushes were big, this soil had to be drawn closer to the stems with the hoes. The spaces between the rows were then levelled with a cultivator to fill the shallow furrows, and a shallow, open furrow finally drawn down the middle for drainage. Thus the roots were never exposed or disturbed; and the hoeing done since, during the drought, certainly was not deep enough to trouble them.

On a recent visit to the Long Ashton Research Station I was interested in a plot of Apples interplanted with Red Currants which has been allowed to grass itself down. The grass is kept under control by ducks, which are taken away only whilst the fruits are ripening. This treatment is, of course, well known to suit Apples; but it was surprising to find the Currants quite vigorous and happy. This may be taken as evidence that they appreciate the absence of root disturbance, and that grass does no harm to fruit trees, and even bushes, provided a generous supply of nitrogen is afforded. I am not trying to prove that cultivation is a mistake, and that a dirty fruit farm is best. I like to see my cultivated land clean; but I would rather have the bush fruit quarters weedy than with the soil drawn away from the stems by hoes, exposing some of the roots. What I do contend is that, however we may decide to manage the cultivation, the method should be such as will avoid root disturbance so far as possible.

Whilst in the West of England, I went over a most interesting fruit farm where cultivation is managed to perfection. Nearly all of it is done with tractors drawing Planet cultivators, disc cultivators, and other implements. Generally, the tractor draws two cultivators attached to a bar behind the machine, a plan which allows the soil to be stirred close up to the rows of trees and bushes, leaving very little to be done by hand. Deep work is never allowed, a depth of four inches being the maximum; and no ploughing or digging is done at any time. The grower admitted that the crops would do just as well if there were a few weeds, but he cannot bear the sight of them. He pointed out what he called a rather annoying thing: One row of Apples in an otherwise perfectly clean plantation had been allowed to grass itself down, being too close to a fence for the cultivator to be used. These trees looked better than the rest! On another fruit farm in the west, I saw the heaviest crop of Plums I have ever encountered. The trees are in grass, kept down and manured by pigs. The orchard went down to grass during the war, as so many did. The trees became poor until the pigs were introduced, after which they picked up and made a lot of new growth. I believe that established trees are best in grass in our climate, provided always that the grass is not neglected. It must be kept down either by grazing or by mowing, and there must be no lack of manure, particularly nitrogenous manure, because the formation of nitrates is greatly reduced under grass. It does not seem to matter whether the nitrogen is supplied in the manure from artificially fed animals or poultry, or whether it is given in chemical fertilisers where the grass is mown instead of being grazed.

RESULTS OF MANURING.

Those of my trees which are on grass land, both Apples and Plums, received as their only manure this season nitrate of soda at the rate of two hundredweights per acre, given a few weeks before blooming. They show the result plainly in the colour and size of the leaves, and probably in the setting of the bloom. Trees that were becoming stunted are, in most cases, showing a good response in the way of shoot and spur production, particularly where they are pruned fairly hard. As I have found before, the combined treatment will almost always impart vigour to the trees on grass which are becoming weakly. For bush fruits I had to depend mainly on a low-grade meat and bone-meal supplemented with sulphate of potash, a dressing which was shared by the young trees planted over the bush fruits. Black Currants received ten hundredweights per acre of the meat and bone. They have done well on this mixture, but better where a light dressing of farmyard manure was applied with half the amount of the artificials mentioned. This seems to be the best manurial treatment on my land. I think it gives rather better results than a heavier dressing of farmyard manure alone. Quite a light dressing of the latter seems to suffice, if helped out by artificials; but it is difficult to do without some natural manure. My soil contains very little potash, and results are generally poor unless this is used. Gooseberries are quite as big a failure without it

as they are on the manurial experiment plot at Long Ashton. They simply cannot be grown at all without either this or farmyard manure, which, of course, contains potash. Red Currants also show marginal leaf-scorch unless they have dung or a mixture of fertilisers containing potash. Apples also show leaf-scorch. I ought not to have omitted potash for them this season, for there is a good deal of scorch in places; and I have found before that potash is a remedy on my soil.

UNUSUAL TROUBLES.

Two unusual troubles are widespread on Apples this year, and have, no doubt, been noticed by many others. One is a peculiar kind of weather injury, seen chiefly on the fruit of Bramley's Seedling. It takes the form of a ring of rough, corky tissue around the eye. The cause, I am told, is that water settled in the slight hollow which is found round the eye in this variety and was frozen there. It is a bad disfigurement, and will render a good deal of fruit unmarketable. The other trouble is a crinkling of the upper surface of the entire leaf, the under surface being broken and puffy. This, I am informed, is the result of a severe attack of Apple Sucker. *Market Grower.*

SEASONAL PESTS AND THEIR CONTROL.

POTATO BLIGHT.

A CONTINUATION of the climatic conditions such as we have experienced during June will undoubtedly cause an early appearance of this disease.

As in the case of most diseases caused by fungi, it is necessary to apply preventive rather than curative means.

These are so well-known as to require little comment, except that some of the preparations made "ready for use" are not always so effective as might be desired.

In order to obtain the maximum efficiency from the copper compound produced by mixing either copper sulphate and lime or soda, it is necessary to make the mixture just prior to using it.

It is also important to mix in definite proportions, otherwise the chemical nature of the precipitated copper compound is altered and this again reduces the efficiency.

To prepare Burgundy Mixture, dissolve 4 lbs. of sulphate of copper in a barrel containing about five gallons of water, then dilute to thirty-five gallons. Iron and zinc vessels should not be used for this purpose, otherwise the copper will be deposited in the form of copper plating. Dissolve in another vessel 5 lbs. of ordinary crystal washing soda in five gallons of water. When both the materials have dissolved mix the two solutions by adding the soda to the copper solution and well stir in order to complete the chemical reaction.

To prepare Bordeaux Mixture, dissolve 4 lbs. of sulphate of copper in five gallons of water and dilute to thirty-five gallons. Slake 2 lbs. of quick lime, and when the reaction has settled down, make this into a thin paste and dilute to five gallons. The "milk of lime" should be passed through a suitable sieve to remove any coarse particles; this should be added to the copper solution and well agitated as in the case of Burgundy mixture.

In preparing either of these mixtures it is most important to use only materials of guaranteed purity. The sulphate of copper if purchased as fine crystals will be found to dissolve easily, and it should be free from sulphate of iron.

The best Buxton lime is undoubtedly the most economical to use.

The precipitated copper compound produced in both mixtures should be gelatinous in character, and should remain in colloidal suspension for a considerable time; where the water is particularly hard it may be found necessary to slightly increase the amount of soda or lime in order to counteract the hardness.

In the application of either Burgundy mixture or Bordeaux mixture it will be found an advantage to use about 2 lbs. of dried milk to

every 100 gallons of the prepared mixture. This greatly increases the spreading of the spray fluid and also assists adhesion.

Some authorities recommend mixtures containing two per cent. copper, but they appear to give very little better results than do the mixtures already mentioned, which make a one per cent. solution.

The same conditions apply as in the application of arsenate of lead, namely, they should be applied with a fine mist spray with plenty of nozzle pressure.

It is considered that these mixtures may act in either or both of the following ways. (1), that the carbon dioxide in the air liberates gradually small quantities of soluble copper, but of sufficient concentration to kill the spores of the fungus. (2), that the fungus spores, on alighting upon the thin film of copper compound secrete a juice that dissolves small quantities of the copper, which is gradually absorbed by the spore, thereby poisoning or destroying the contained protoplasm.

MILLIPEDES.

One or two cases have been brought to the notice of the writer this season where millipedes have been responsible for an almost complete failure of a Cucumber crop, necessitating pulling up the plants and planting others.

Various methods were tried to eradicate the pests before replanting, and one which is worthy of mention consisted in dissolving in water calcium cyanide at the rate of eight ounces in ten gallons of water, and applying this to ten square yards of surface area of border. The effect was very remarkable; about ten to fifteen minutes after application the surface of the soil was covered with dead millipedes.

Twelve hours later the beds were opened and examined, and it was found that all forms of life were extinct to a depth of about nine inches. The beds were turned over and remade without any further additions and fresh plants put in five days after the application of the cyanide. The plants grew away quite well and showed no signs whatever of any injurious effects from the treatment.

RED SPIDER ON CARNATIONS.

Two large nurseries were visited last week where red spider is kept in absolute control by means of the naphthaline treatment. The main essentials to be observed when fumigating are:

1. Cut the blooms close prior to starting;
2. Maintain a level temperature of about 65° to 70°F.
3. Have a fair amount of humidity in the house.
4. Fumigate on either a dull day or a still, warm night.
5. Use a concentration of six to eight ounces per 1,000 cubic feet, vaporised in the lamps over a period of twelve hours.

Theodore Parker.

VEGETABLE GARDEN.

AUTUMN AND WINTER SALADS.

FREQUENT sowings of quick-maturing varieties of Lettuce should be made from now until the end of August to provide heads for use up to Christmas. Choose a sheltered part of the garden for this crop, such as a south border from which early Potatoes or Peas have been cleared. The ground should be forked over, made firm by treading, and the surface raked finely. Draw drills about ten inches apart and sow the seeds thinly. If the weather is dry, water the drills before sowing, as this will greatly facilitate quick germination.

Sow two or three sorts at the same time for the sake of variety and also to form a sure succession. Rake the bed over finely at the finish and label each sort.

So soon as the seedlings are large enough, thin them to six or eight inches apart, and draw a little fine soil up to them to keep them steady. Hoe the soil on frequent occasions to keep down weeds and promote quick growth. Water the rows copiously in dry weather, preferably in the afternoons or evenings. Make one or two more sowings at intervals of a fortnight or so and treat the later sowings in the same manner.

Where plenty of cold frames are available, it is a good plan to sow the later batches in these as the plants can be protected from excessive frost or rain. Keep a sharp watch for slugs as cooler weather approaches, and dust around the plants with soot and lime, or place sharp, sifted coal ashes around them. Admit air freely by night and day; in fact, the frames should never be quite closed, or the plants will damp off wholesale if the weather is wet and cold.

Stir the soil frequently between the plants and they will grow rapidly. Cabbage varieties, such as Commodore Nutt and Golden Ball, are excellent for autumn salads, as they mature quicker than the Cos varieties.

Endive is an excellent substitute for Lettuce, when the latter cannot be produced easily, and the same treatment as regards sowing and subsequent culture will suffice, except that the plants should be allowed rather more room in which to develop. Blanching is easily effected by tying the plants around with broad bast, or gathering up the outer leaves and placing a six-inch pot over the plant. These methods will answer well provided the weather is open, but in frosty or snowy weather batches should be lifted as required and planted in frames or, better still, for later supplies, in a Mushroom house or any shed where they can be kept dark, using old potting soil in which to plant them.

Plant firmly and well water the roots, but take care to keep the foliage dry, or the leaves will damp off. Admit plenty of fresh air at all times. Never tie up the plants in the outdoor beds unless they are perfectly dry, and this is best done in the afternoons. There are several varieties of Endive, both Moss Curled and Broad-leaved; the latter is perhaps the best for winter use.

Endive is somewhat bitter unless thoroughly well-blanching. The centres of the plants should be a creamy colour when ready for use, and this may easily be attained in a short time if the plants are kept in absolute darkness. They should be examined occasionally to make quite sure that they are not damping; if a plant is affected with damping it should be removed at once, as it may affect the rest.

Chicory should be sown in April or May, as it requires a longer period of growth than the preceding plants. It forms a large, fleshy root, not unlike that of a Parsnip, and produces upright, bright green growth, somewhat like a Dandelion. Sow in rows made one foot apart, and allow the same distance between each plant in the rows. This crop will not need much attention except to be kept clean by hoeing between the rows. The better the plants the more edible material they will produce, therefore they should be sown in good, deep soil and allowed to stand well into the autumn to complete their growth. When the plants are required for use, they should be dug up as required and planted in pots or deep boxes fairly closely together and placed in a dark shed or a Mushroom house, as advised for Endive. The foliage should be cut off to within an inch or so of the crown. Water the plants liberally and they will soon begin to produce second growth. When they have made six inches or so of blanched growth, cut the heads off close to the crown. The roots may be thrown away as they are of no further use, and fresh batches introduced, according to need.

Quick-growing varieties of Radish may be sown in frames at frequent intervals during the early autumn. Sow thinly and well water the plants. They will revel in as much heat and moisture as is possible in cold frames at this season, therefore the frames should be closed early in the afternoon to conserve all the warmth

available. Radishes require to be grown quickly at all times; they are very ornamental in salads, besides adding variety.

Mustard and Cress should be sown on the surface of loamy soil in boxes and germinated in a warm house or frame. Watering should be done with a fine-rosed can, and the seed-box covered with a piece of glass and paper until germination takes place. Sow at intervals of a week, putting the Cress seed in a day or so before the Mustard seed. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Robert Fortune.—I crave space in your valuable columns for the following request: Have any of your older readers any personal recollections or correspondence of Robert Fortune, who died in Brompton in 1880? From the forties onwards, he was a valued contributor to *The Gardeners' Chronicle*. I am engaged in writing his life and an account of his travels in China, but find it difficult to get in touch with his personal life. The points on which I am particularly anxious to obtain additional information are as follow: his early life prior to 1840; his latter life after 1862; a photograph or drawing which would give some idea of his appearance; any personal recollections of his character. If any of your readers can supply this information, they will earn the gratitude of *E. H. M. Cox, 12, York Terrace, London, N.W.1.*

Deterioration of Strawberries.—On page 440, Mr. Middleton asks for other readers' observations on the deterioration of Strawberries, and refers to neglected patches left alone for some timing recuperating. In such patches that I have seen, it is the young runners thrown out the previous year that are vigorous and produce flowers and fruits. There is usually very little trace of the original plant or, if the first runner produced from it is still alive, it is usually barren. I found a neglected patch of runners on taking charge here, and transferred the best runners to a cultivated part of the garden, but they absolutely refused to root in the soil. This I attributed to the amount of coal ashes dug into the garden by my predecessor. While in charge of a garden in Sussex, where Strawberries grew and fruited in abundance without the least sign of deterioration, my nearest neighbour—on the same kind of soil—could not get a crop at all. On looking round his place one day in winter, I noted coal ashes strewn all over his vegetable quarters, which he said was to ward off slugs. I pointed out to him then that that was the reason he was not successful with his Strawberries. Where abundance of farmyard manure and leaf-mould is used in gardens, Strawberries grow luxuriantly and produce sufficient foliage to keep the nets above the fruits without any other support. In my opinion, scarcity of manure (cow dung, especially) and the mistaken idea that coal ashes are beneficial in a garden, are the main causes of deterioration. *Grigor Roy.*

Embothrium coccineum from Cuttings.—I have been wondering if any of your readers have ever been successful in striking *Embothrium coccineum* from cuttings; if so, I would like to know how they have succeeded. I know the plants grow freely from seeds and that the stage from the seed pans to pots is a critical one. The following may be of interest, and is quite authentic. A few years ago, I sold a farmer a plant of *Embothrium coccineum* in a pot. He planted it in his garden and after a few years' growth some fair sized branches were broken off during a storm; not realising the difficulty of rooting this plant from cuttings, he simply put in these branches, as he would have done with a Privet or Laurel branch, and they grew into fine plants! Have any gardeners had a similar experience? *J. G. Treseder, The Nurseries, Truro.*

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, June 17, the members of Committee present were: Messrs. J. B. Adamson (in the chair), C. Branch, A. Burns, A. Coningsby, D. A. Cowan, J. Cypher, J. Evans, A. Keeling, J. McCartney, D. McLeod and H. Arthur (Secretary).

FIRST CLASS CERTIFICATE.

Cypripedium Astarte, Bridge Hall var. (*Psyche* × *insigne* *Sanderæ*)—A beautiful round flower. From Mrs. BRUCE and Miss WRIGLEY.

AWARDS OF MERIT.

Epi-Cattleya Nabo.—From Mrs. BRUCE and Miss WRIGLEY; *Odontoglossum Towneley* (*Lambeauianum* × *Col. Leith*).—From J. B. ADAMSON, Esq.

GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Silver Medal was awarded. It contained *Masdevallias Carderi* and *Calura*; *Dendrobiums Arachnitis* and *atroviolaceum*; *Vanda cristata*; *Odontoglossum eximillius*, *Odontioda Laura*, *Hexadesmia crurigera*, and *Cypripediums* in variety. Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were also awarded a Silver Medal for a group that included *Cypripedium Astarte*, Bridge Hall var., *Epi-Cattleya Nabo*, *Dendrochilum latifolium*, *Oncidioda Bruceae* and *Miltonia Hyeana* seedlings.

Captain W. HORRIDGE, Bury (gr. Mr. A. Coningsby), showed *Miltonia Bleuana* var. *Reine Elizabeth* (magnificent flowers), *M. Hyeana* and *M. hybrids*; *Odontoglossum St. Georges*, and *Anguloa Cliftonii*.

Messrs. CYPHER AND SONS exhibited a group to which a Silver Medal was awarded. *Cypripedium Parishii*, *C. grande atratum*, *C. St. Alban*, *C. Harrisianum superbum*, *C. Geo. Kettle*, *C. callosum Sanderæ*, *Miltonia St. Andres* and *Vanda teres* were leading features. Messrs. CHARLESWORTH AND Co. contributed *Odontoglossum Amabilicuity*, *O. Britannia* and *O. Omega*, various *Odontiodas*, *Miltonia Bleuana* and *M. Charlesworthii*. Messrs. KEELING AND SONS showed *Brassia longissima*, *Masdevallia Bocking* hybrid and *Miltonia hybrids*.

ANNUAL GENERAL MEETING.

Captain W. Horrridge, M.C., presided at the annual general meeting, when the report and balance sheet were adopted. Samuel Gratrix, Esq., was appointed President for the ensuing year, and the Executive Committee was re-appointed. The Awards Committee was re-elected with Mr. G. V. Llewelyn in the place of the late Mr. H. T. Pitt, and Mr. W. J. Morgan in place of the late Mr. E. W. Thompson. Mr. R. Ashworth was re-appointed Hon. Treasurer, and Mr. H. Arthur, Secretary. The prizes were presented to the successful exhibitors as follow:—J. J. Bolton's Trophy to S. GRATRICK, Esq., gardener's prize to Mr. C. BRANCH; Messrs. Sanders' prize to J. B. ADAMSON, Esq., gardener's prize to Mr. J. HOWES; the last-named gentleman and gardener also won the Charlesworth, Cowan, Cypher, Evans, Gratrix and McBean prizes, and the Horrridge Challenge Cup. Messrs. Armstrong and Brown's Trophy went to S. GRATRICK, Esq. (gr. Mr. C. Branch); the Botanic Society of Manchester's Silver-Gilt Medal to Mr. J. HOWES, and its Silver Medal to Mr. A. BURNS; Mrs. Smith's prizes to a gardener were won by (1) Mr. J. HOWES; (2) Mr. A. BURNS, and (3) Mr. C. BRANCH. The Society's Gold Medals were presented to The Hon. G. E. VESTLEY and Mr. G. V. LLEWELYN.

The next meeting will be held at the Great Flower Show at Stanley Park, Blackpool, on Wednesday, July 20, 1927.

The Secretary reported the death of G. F. Moore, Esq., of Bourton-on-the-Water, a most enthusiastic lover of Orchids, and one who, as a raiser and grower of *Cypripediums*, possibly held the position of having the finest collection of these plants in the world.

ROYAL TUNBRIDGE WELLS HORTICULTURAL.

THE annual show of the Royal Tunbridge Wells Horticultural Society was held on the 5th inst. in the Calverley grounds, an ideal venue. The numbers of both trade and competitive exhibits were largely in excess of those of previous years, and the Committee will have seriously to consider the extension of space for future exhibitions. The large, up-to-date pavilion and marquee were uncomfortably crowded early on the first day. The gangway space was quite inadequate and did not allow visitors a fair opportunity to inspect the exhibits.

The Silver Cup and premier award for the best trade display was won by Mr. GEO. I. ADAMS, Tunbridge Wells, who filled one end of the large tent with a display of herbaceous perennials, Gladioli, alpinas and Violas. A model of an estate was included. This showed in their true proportions, a hard-court, orchard, kitchen garden and lawn, together with residence and outbuildings. The model covered an area of 240 square feet.

MESSRS. CHARLTON AND SONS, Tunbridge Wells, were adjudged to have the second best trade exhibit covering 1,000 feet of space and including a fine collection of one hundred varieties of choice hardy trees and shrubs in pots. Gladioli, Delphiniums and other perennials helped to make an attractive exhibit. Sweet Peas included the new Linden Rose, a smaller and paler flower of the Charming type.

MESSRS. R. WALLACE AND CO., LTD., Tunbridge Wells, were awarded the third prize for an exhibit arranged in an outside tent, including English Iris, Ixias, Lupins, Anchusas and other perennials. The small tent in which this exhibit was staged was flanked by two beds filled with small shrubs in pots. Messrs. C. ENGELMANN LTD., Saffron Walden, were awarded a Gold Medal for Carnations.

Messrs. HOLLAMBY, Groombridge, were awarded a Gold Medal for an exhibit which comprised collections of trees and shrubs and herbaceous perennials.

A Gold Medal was also awarded to the CHEZ NOUS NURSERIES, Newick, Sussex, for alpinas, dwarf Japanese trees and shrubs, Cacti and perennials.

Messrs. GEORGE BUNYARD AND CO., LTD., Maidstone, put up a collection of Roses and herbaceous perennials and were awarded a Gold Medal. Gold Medals were also granted to Mr. F. WEBBER, Tonbridge, for a group comprising perennials, Irises, alpinas and Gladioli, and to Mr. W. C. HOLLANDS, Tunbridge Wells, for Ferns and floral designs. Mr. F. A. MARSHALL the Treasurer of the Society, showed two large groups near the tent entrance and also received a Gold Medal.

Mr. W. A. R. CLIFTON, Willingdon, Eastbourne, contributed a group of Zonal Pelargonium blooms and was awarded a Silver-gilt Medal. A similar award was made to Messrs. LANGRIDGE AND Co., Westerham, for Sweet Peas and Gladioli, and to the CROWBOROUGH GROWERS' ADVERTISING ASSOCIATION for Cucumbers and Tomatoes.

There were no exhibits in the nurserymen's classes for cut Roses. In the other open Rose classes, Mr. S. W. BURGESS was placed first for eighteen blooms; Miss HILDA ROGERS for twelve blooms; H. H. SCOTT, Esq. (gr. Mr. G. Edwards), for six vases; and Mr. S. W. BURGESS for the best three vases. In classes for smaller growers Captain SNELGROVE was the chief prize-winner. R. H. MARTIN, Esq. (gr. Mr. P. Morphew), excelled in the local class for twelve blooms.

An outstanding feature of the show was the table of fruit staged by J. J. BARROW, Esq. (gr. Mr. H. Kemp).

Sweet Peas were shown finely by F. W. FRANKS, Esq., Tonbridge (gr. Mr. W. Humphrey) and he followed up his recent successes by securing the premier award, closely followed by Col. D. P. HAIG (gr. Mr. F. Comber).

Among other most successful competitors in the amateurs' classes were Messrs. P. S. FOSTER (gr. Mr. T. G. Knight), A. GRACE, G. MAYER, J. J. BARROW (gr. Mr. H. Kemp), R. ALLDAY, G. MIALI (gr. W. Cross) and PAUL WATERLOW.

WOLVERHAMPTON FLORAL FETE.

FOUR of us—Mr. E. Beckett, Dr. Williams, Mr. W. H. Divers and the writer, set out for Wolverhampton on Tuesday, July 11. Pursuing our several ways during the tail-end of a vicious thunderstorm, we arrived at Paddington in good time to catch the 6.10 p.m. and annex corner seats in a smoking compartment. Some kindly spirit that watches over travelling horticulturists suggested taking the first service of dinner—a suggestion adopted unanimously. All went well until Leamington was reached, when Birmingham passengers were detrained and we were informed that terrific storms around the capital of the midlands had flooded lines, crumbled embankments and done other things that necessitated the diversion of our train to another route. For awhile the journey was continued, albeit somewhat slowly, and even in the rain and gathering gloom we admired the fertile vale of Evesham, and sympathised with growers whose Asparagus fields were running with water. But now our rate of travel slowed down under a "safety first" clause. With leaden feet the minutes and even the hours rolled by and presently the train was running slowly through an inland sea of water, apparently about two feet deep. Followed various stoppages and a long wait in sight of our objective, and at last, at 11.30 p.m., we arrived at Wolverhampton safely, but three hours late!

Rain fell heavily through the night and we were awakened about 7 a.m. on Wednesday by thunder and rain that continued with little intermission until 10.20, when we sallied forth and reached the spacious West Park in due course. Here, the water lay almost level with the tops of the grass blades, creating a swamp, and men were cutting grips through the lawns in an endeavour to drain away the water. Within the tents was a scene that is fortunately rarely experienced; the feet of busy men, delayed by the storm and hurrying to complete their exhibits in time, had churned grass and soil and debris into a morass of thin mud, ankle deep. In view of the difficulties they had encountered, the competitors were allowed an extra hour, so judging did not commence until about noon. Judges and pressmen had an extraordinary experience, but in due course the much-worried, much-to-be-pitied, perspiring and still cheery officials, got floor joists laid down over stretchers and thus made locomotion easier. The same four, accepting so much of the generous hospitality of the Committee as time would allow, foregathered again at Wolverhampton station, just in time to catch the 2.30 for town; about our lower extremities we were a disreputable looking quartette, but still maintaining that cheerfulness which good horticulturists show, no matter what the weather and other difficulties may be.

We sympathise deeply with the Wolverhampton authorities and trust that fine weather favoured the second and third days of their fete. They deserved success and had got a fine exhibition together; if they failed, financially, theirs was a splendid failure for which the elements alone were to blame. These same elements must also bear the blame if the following notes are fewer and less descriptive than usual, for, we would add, note-taking is no fun in a warm, saturated atmosphere, and with one's feet in a mud bath! Like our Wolverhampton friends, we have done our best under the circumstances.

Trade exhibits were numerous and beautiful, and we hope to publish the awards they received in our next issue.

Groups and Plants.

The entries in the large group classes produced a fine display of artistic and skilful cultivation. For a large miscellaneous group, covering a ground space of twenty-five feet by twelve feet, Messrs. J. CYPHER AND SONS won the chief award (£40) with a delightful exhibit, in which brilliant Codiaeums, noble Palms and graceful Humeas were charmingly arranged with Gesneras, Fuchsia Coralie, Begonia Rex, Lilium Henryi, Carnations, Dracaenas, *Cypripediums*, *Dendrobiums*, *Anthuriums* and *Nandina domestica*. The Cheltenham firm had a much bolder central arch than usual, but this was made to add to rather

than detract from the elegance of their exhibit. Second prize was awarded to Sir G. H. KENRICK (gr. Mr. J. Macdonald), Edgbaston, whose bold background was a trifle heavy and needed more colour, but the front of the group was very pretty, the numerous Miltonias adding elegance and colour; third prize fell to Mr. W. HOLMES, Chesterfield, who had a very bright display in which Crassulas and Ixoras were conspicuous features.

The Cheltenham firm was also successful in the class for a large group wherein plants in flower were not admissible; Codiaeums, Dracaenas, Aralias, Phyllanthus and Selaginellas were used to great advantage in this first prize arrangement. Mr. W. HOLMES secured second prize, and Sir G. H. KENRICK the third.

The best fifteen plants in pots not exceeding ten inches in diameter, were those shown by Messrs. J. CYPHER AND SONS, whose leading subjects were Clerodendron Balfouri, Hydrangeas, Fuchsia Coralie, Statice, Lilium longiflorum and Codiaeums; Mr. W. HOLMES received the second prize.

Always an interesting class at Wolverhampton, is the one for a group of one kind of plant and on this occasion the competition was unusually keen. The space allowed is sixty square feet. F. SHARPE, Esq. (gr. Mr. T. H. Catton), Tettenhall, won the first prize of £10 with finely-grown Astilbes; F. SANKEY, Esq. (gr. Mr. R. Maybury), Wolverhampton, second, with Heliotropes; Messrs. J. CYPHER AND SONS, third, with Hydrangeas, and Mr. A. FALCONER, Cheadle, fourth, with Gesneras.

First prize and Messrs. Blackmore and Langdon's Silver Challenge Trophy were won by Major S. THOMPSON (gr. Mr. J. White), Oaken, with a fine group of superbly grown Begonias, the blooms being of wonderful size and colour; Alderman A. B. BANTOCK (gr. Mr. W. J. Woodham), second, with very fine baskets of Begonias, but less fine, erect-growing sorts.

For a collection of plants and cut flowers arranged for effect on a table space of six feet by four feet, Messrs. J. CYPHER AND SONS led, showing Humeas, Codiaeums and Orchids in pleasing association; second, Mr. F. A. SANKEY; third, Mr. W. HOLMES.

In the group class not open to the trade, J. C. SWANSON, Esq. (gr. Mr. F. W. Cook), Wolverhampton, secured the leading award with good plants pleasingly arranged; Francoas, Gloxinias, Celosias, Codiaeums and Calceolarias were all effectively displayed. The second award went to G. MASON, Esq. (gr. Mr. F. C. Clark), Penn; and third to Mr. FALCONER.

ROSES AND CARNATIONS.

Premier honours for a display of Roses on a space twenty-four feet by four feet were won by Mr. T. ROBINSON, Porchester, with a grand exhibit that contained pillars and sheaves of beautiful blooms of Mrs. H. Morse, Shot Silk, Lady Inchiquin, Madame Butterfly, Hortulanus Budde, Mrs. H. Stevens and Lord Charlemont, among other good sorts; Messrs. W. LOWE AND SON, Beeston, second.

In a smaller class, Mr. GEORGE PRINCE led with a brilliant exhibit in which the flowers were placed rather too closely together; Mr. J. MATTOCK second, and Mr. G. MARRIOTT, Carleton, third.

Mr. MATTOCK was also successful in the class for five baskets of Roses, with good blooms of Mrs. H. Morse, Golden Emblem, Lady Inchiquin, Mrs. T. Gilbey and Louise Criner; Mr. G. PRINCE had the finest three dozen exhibition blooms, with Messrs. JARMAN AND CO. second; Mr. PRINCE also led for a dozen new Roses, his set including Gwen Carr, J. Russell and Mrs. Barraclough.

For a basket of dark Roses, Mr. J. MATTOCK was placed first with Lord Charlemont, while for a basket of light roses, Mr. G. PRINCE was the most successful competitor, with Mrs. H. Morse.

Mr. J. MATTOCK had the best eighteen Rose blooms, and Mr. G. PRINCE came second.

Two very fine displays of Carnations were arranged, and of the two competitors, Mr. CHARLES WALL was the most successful, showing a fine arrangement of baskets, pillars and vases of Topsy, Enchantress Supreme, Salmon Enchantress, White Pearl, Dixie, Saffron, etc.

Mr. C. ENGELMANN was awarded the second prize, and had superb flowers of Laddie, Brilliant, Nero, Sheila Greer and Saffron. Each of these displays occupied a space of twelve feet by four feet, and contributed a fine feast of colour and skilful arrangement.

Messrs. LOWE AND GIBSON showed the best group of border Carnations, staging beautiful flowers of Elaine, Skirmisher, Linkman, Mrs. Percy Smith and G. Griffith; Mr. C. WHITE, Walsall, second; and Messrs. J. B. GROVE AND SONS, Sutton Coldfield, third.

HARDY FLOWERS.

There was but one exhibit of hardy border flowers arranged on a space twenty-five feet by seven feet, but any competitor would have found it difficult to beat Messrs. BEES' grand display of splendid Delphiniums, Eremurus Bungei, Lilium regale, L. Henryi, Gaillardias, Campanulas, etc. The Messrs. BEES were also the only exhibitors of a big group of Delphiniums, and here again they would have been difficult to beat, as their thirty huge sheaves of magnificent spikes of first-rate varieties, with a few smaller vases, made up one of the finest groups of these flowers we have ever seen.

For eighteen baskets or vases of Sweet Peas, the leading award was won by Sir RANDOLF BAKER (gr. Mr. A. E. Usher), Ranston, Blandford, with fine flowers of Mammoth, Mrs. A. Hitchcock, Carmelita, Gleneagles, R. F. Felton and other popular sorts; Mr. G. H. BROOKSHAW second, and Mr. CHARLES WALL third.

Mr. C. WALL led for a dozen varieties of Sweet Peas, and Mr. W. VERNON was placed second, but these would have had to give way to Sir R. BAKER but for the fact that this well-known grower had two bunches of Magnet in his otherwise excellent set. However, the last-named had the best six bunches, winning easily from Mrs. P. ADAMS (gr. Mr. W. Pugh), Kidderminster.

In other Sweet Pea classes, Sir R. BAKER, Mr. J. G. ROBESON, Banbury, and Mr. R. CHALONER, Crewe, were successful prize-winners.

Mr. SANKEY had the best group of Antirrhinums, W. B. VERNON, Esq. (gr. Mr. G. Egar), Wolverhampton, coming second, and Mr. E. H. BURDEN, Tettenhall Wood, third; the first prize set showed the better quality, and the second one the better arrangement.

DECORATIVE EXHIBITS.

Mr. C. R. LUPTON, Birmingham, was the leading prize-winner in an open class for a table decoration, showing a bright and dainty design of Gesnera, Calceolaria, Francoa and Anthurium flowers; Sir J. H. KENRICK, second, using Gloriosa blooms chiefly; Mrs. REEVE third, with yellow Roses.

In another class, professionals excluded, Mrs. REEVES led with a beautiful arrangement of yellow Roses; Mr. REYNOLDS, Tettenhall, second, with Madame Butterfly Roses.

VEGETABLES.

In the classes for vegetables, LORD LECONFIELD (gr. Mr. Streeter), Petworth Park, was the most successful competitor, other prize-winners being A. H. HICKMAN, Esq. (gr. Mr. J. H. Parker), Kidderminster; Mr. FALCONER, Cheadle Royal Mental Hospital; and the BISHOP OF WORCESTER (gr. Mr. A. Fletcher), Kidderminster.

NATIONAL SWEET PEA.

THE twenty-seventh exhibition of the National Sweet Pea Society was held on the 7th and 8th inst. in the Royal Horticultural Hall, Vincent Square, Westminster. The show was a great success, for the classes were well filled and the quality of the majority of the exhibits of high merit.

This Society is fortunate in having a large number of cups and trophies presented by the trade, corporations, the daily press and amateur lovers of the Sweet Pea for competition at these annual shows, so that the first prize in many of the classes included a valuable trophy. The schedule included fifty-seven classes, and all types of growers were catered for.

Traders were excluded from the first five

classes which were amongst the most important in the schedule.

The Sutton Cup was offered in the class for eighteen vases, distinct, of varieties recommended in the Society's classification list and the Cup has to be won three times in succession to be gained outright. Only one competed, Sir RANDOLF BAKER, Bt., Ranston, Blandford (gr. Mr. A. E. Usher), and he was worthily awarded the first prize. He had grand spikes of Royal Mauve, What Joy, Hebe, Coralline, Crusader, Powerscourt, Gold Crest, Mrs. A. Hitchcock and other choice varieties.

Five competed in the class for the *Daily Mail* Challenge Cup, and here the quality reached a very high standard generally. The winning collection, shown by Dr. BOYALL, Minehead, also gained *The Gardeners' Chronicle* Medal as the best amateur's exhibit in the show, and his vase of Magnet was adjudged the best in the exhibition. His other sorts were Chieftain, Wild Rose, Constance Hinton, Lucifer, Youth, Royal Sovereign, Ivory, Picture, Purple Perfection, Charming, Powerscourt and Mammoth. The second prize was awarded to Major C. C. KEAHLE, Calcot Grange, Reading (gr. Mr. A. W. Gown). This collection also was of superb quality and the stems were of great length and vigour. The bunches were beautifully even, and each flower in perfect condition. Notable sorts were Constance Hinton, Royal Sovereign, Valentine, Royal Mauve, Wild Rose and Purple Perfection. Third, Mr. F. W. FRANKS, Tonbridge (gr. Mr. W. Humphrey), who also showed grand spikes of popular varieties.

The class for six vases of Sweet Peas, distinct, to be selected from varieties recommended by the Committee in the classification list attracted nine competitors, and a keen competition resulted. The premier award, the Reginald Cory Cup, was awarded to G. L. F. COOK, Esq., Hayes (gr. Mr. H. Ebsworth), for splendid spikes of Charming, Chieftain, Constance Hinton, Grenadier, Powerscourt and Magnet; second, Mr. JAMES E. STEVENS, Weymouth, for grand flowers of Elegans, Gold Crest, Hebe, Royal Scot, Austin Frederick Improved and Charming; third, Mrs. HENRY WILLIAMSON, Canterbury (gr. Mr. W. Langsdon).

The first prize for the best twelve vases of British-raised Sweet Peas, to include at least four varieties raised by Mr. J. Stevenson, were shown by Sir RANDOLF BAKER, Bt., who included such varieties as Mammoth, Coralline, Model, Powerscourt, Purple Monarch, Venus and Gold Crest.

Mr. F. C. Woodcock offered prizes in a class for three vases, distinct, selected from specified colours, and the winner was F. T. WHEELER, Esq., Yarmouth (gr. Mr. F. Leonard). He showed fine spikes of Powerscourt, Gold Crest, Mrs. A. Hitchcock, Model, Daventry and Austin Frederick; second, Sir RANDOLF BAKER, Bt., whose best sorts were Hebe, Mrs. A. Hitchcock and Gold Crest.

The Monro Perpetual Challenge Trophy for twelve vases, in not fewer than six varieties, raised or introduced by the exhibitor, was won by Messrs. W. E. KING AND CO., Coggeshall, with Vectis, Daventry, Gladys, Olympia, Leslie Rundle and Dinkie.

The best three vases of Sweet Peas, distinct, were shown by Mr. A. JOHNSON, Laceley, near Grimsby; second, Sir RANDOLF BAKER, Bt.; third, Miss RUSSELL, Canterbury (gr. Mr. C. W. Rendle).

Another interesting class was that for six vases of distinct varieties raised by the exhibitor, in which Messrs. E. W. KING AND CO., Coggeshall, were alone. They had the first prize for the varieties Olympia, Vectis, Patriot, Gladys, Leslie Rundle and Pimpernel.

The E. W. King Cup was offered for twelve vases of Sweet Peas, distinct, of varieties offered for sale in the autumn of 1926 or spring of 1927. This was a good competition in which seven took part. The premier award was made to E. ZACHNER, Esq., Sevenoaks (gr. Mr. A. W. Richardson), for a fine exhibit, the best sorts being Britannia, Silver Sheen, Royal Sovereign, Gladys, Olympia, Daventry, Pimpernel and Youth; second, Miss RUSSELL, with exceptionally fine spikes of Coralline, Sybil Henshaw and Gleneagles; third, F. T. WHEELER, Esq., Yarmouth (gr. Mr. J. Leonard.)

The Burpee Cup, offered for six varieties, distinct, of which at least two sorts were raised or introduced by Messrs. Atlee Burpee and Co., was won by Sir RANDOLF BAKER, Bt., with Delightful, Gladness, Model, Carmelita, Purple Monarch and What Joy; second, Mr. H. D. TIGWELL, Greenford, with excellent flowers of Model, Silver Queen, Royal Mauve, What Joy, Royal Blue and Delightful.

SINGLE BUNCH CLASSES.

These included thirteen classes in various colours, and were educative in demonstrating which varieties are the best of their colours for exhibiting. The first and second prizes were awarded as follow:—

Blue: First, Sapphire, shown by Mr. F. W. FRANKS; second, Mr. E. WILKINSON, Basingstoke, with Mrs. Tom Jones.

Cerise or Cerise-Scarlet: First, Grenadier, shown by Mr. FRANKS; second, Charming, shown by Mr. J. E. STEVENS, Weymouth.

Cream, Buff or Ivory: First, Ivory Picture, shown by Mr. FRANKS.

Cream-Pink: First, Venus, shown by Mr. ROBERT SANDFORD, Mildenhall, Ely; second, Picture, shown by Mr. E. WILKINSON, Basingstoke.

Pink: Hebe, shown by Mr. F. W. FRANKS; second, the same variety, shown by Major C. B. KEAHLIE, Calcot Grange, Reading.

Flushed on White, or Cream Ground: First, Queen of Roumania, shown by Miss RUSSELL, Canterbury.

Lavender or Mauve: First, Powerscourt, shown by Mr. FRANKS; second, Austin Frederick, shown by Miss RUSSELL.

Maroon: First, Maroon King, shown by Sir RANDOLF BAKER, Bt.

Orange or Orange-scarlet: First, Colorado, shown by Mr. FRANKS; second, Wizard, shown by Major KEAHLIE.

Picotée-edged: First, Youth, shown by Mr. E. ZACHNER, Sevenoaks; second, Youth, shown by Mr. E. WILKINSON, Basingstoke.

White: First, Model, shown by Mr. FRANKS; second, Avalanche, shown by Miss RUSSELL.

Any other Colour: First, Olympia (purple), shown by Mr. FRANKS; second, George Shawyer, shown by Miss RUSSELL.

AMATEURS' CLASSES.

The Counties Classes were somewhat irregular in the competition. There are five altogether, and each requires six vases of distinct varieties. The Southern Class was the most popular, for there were seven exhibits of which the best was shown by Mrs. SHIRLEY WOOLMER, Bracknell, with Mrs. SIDGWICK, Ingatestone, second, and Mr. H. R. PELLY, third. In the Western Counties area, which includes South Wales, there were six exhibits, and here Mr. F. CHURCHWARD, Newton Abbot, was first with a fine collection. Sir RANDOLF BAKER, Bt., was a good second, and Mr. J. E. STEVENS was third. Five members competed in the Midland Class, and Dr. G. S. LEGGATT was first, with vases of good size, form and colouring. Mr. J. G. ROBESON, was second, and Mr. G. W. BEAUFOY was third. Mr. J. H. EMMETT was the only exhibitor in the Northern Class, and he was awarded the first prize for a very meritorious collection. There was no exhibit in the remaining District classes. The Irish growers experienced disastrous storms and were compelled to cancel entries. There was no entry in the newly-formed London County class, in which it was hoped that members residing in the London County Council area would compete.

The Bide Class, which is open to those who employ only one gardener, is always popular, and the most successful exhibitor was W. MARTINEAU, Esq. (gr. Mr. C. Ball), Boxmoor, who had nine exceedingly good vases of Sweet Peas; C. H. SALE, Esq., J.P., Leamington, was second.

Competition was good in the class for members who employ only one gardener with occasional assistance, and here Dr. G. S. LEGGATT was first. The new Hamilton Cup was won by

Mr. J. J. ROBESON, Banbury, with twelve excellent vases of Sweet Peas, while Mr. Wm. HUFFEY, Tonbridge, won the Hawmark Cup with six equally good vases. The *Amateur Gardening* Cup did not draw quite so many exhibitors as usual, but the competition was very keen, and the quality of the blooms reached a high standard of excellence. Mr. Wm. HUFFEY was the winner, and Mr. F. J. ROGERS, Isle of Wight, last year's winner, had to be content with second place. The Small Growers' Cup was won by Mr. H. W. LIVINGTON, Isle of Wight, with twelve vases of high quality Sweet Peas.

The class of recent introduction into the schedule, open only to those who grow their Sweet Peas unaided, retains its great popularity, and again the competition was very keen. The most successful exhibitor was Mr. H. W. LIVINGTON, and Mr. F. J. ROGERS was a good second. A new class was that open only to members who had not previously won a first prize at the Society's shows. There were ten entries, and the blooms were of great merit. Mr. E. SMITH, Cholsey, was first, with Mr. W. D. SELL, Bristol, second, and Mr. H. CHING, Devon, third.

The Novices' Division continues to be very popular, and each of the four classes had a large number of entries, and many really excellent spikes of Sweet Peas were staged. Mr. G. DE LA PERELLE, Somerset, won the medal in the principal class. Other first prize winners were Mr. E. R. M. SPEILMAN, Capt. R. A. DARNEY and Mr. A. ARCHER.

The various Ladies' classes for decorations with Sweet Peas made an attractive display, though there was nothing novel or of outstanding merit in the Dinner Table Classes or that for a decorated occasional table. The best dinner tables were arranged by Mrs. H. A. KING, Kempston, in the amateurs' class, and by Miss GLADYS BURT, Coggeshall, in the trade section. Mrs. A. D. RUFF, Luton, was first, both with a beautiful basket and a bowl of Sweet Peas in the amateurs' classes, and Mrs. RUNDLE, Canterbury, was equally successful with a vase of Sweet Peas, while Miss GLADYS BURT was first with an artistic bowl of Sweet Peas.

NATIONAL ROSE.

The provincial exhibition of the National Rose Society was held this year in the pleasant town of Cheltenham, at the Montpellier Gardens, in conjunction with the local show, on July 6 and 7.

Considering the difficulties incidental to more or less continuously wet weather, the display was quite good; indeed, the bank of Roses formed by the exhibition of displays was a splendid feature and merited the admiration it received.

There were comparatively few new Roses, as raisers were evidently holding back for the London show on July 15. No Gold Medals were awarded.

CERTIFICATES OF MERIT.

May Wettern.—A Hybrid Tea variety of Madame Abel Chatenay type, but with rich salmon-pink colour and larger blooms than are found in the still popular old sort. This newcomer should be good alike for garden decoration and for exhibition. Shown by Messrs. ALEX. DICKSON AND SONS.

Royal Scot.—A very bright and effective Hybrid Tea Rose with flowers of pleasing form and medium size. It is apparently a strong grower and suitable for bedding. The colour is deep orange-gold with bright orange-cerise shading on the outer sides of the petals. Shown by Messrs. DOBBIE AND CO.

GROUPS.

Mr. E. J. HICKS won the Jubilee Trophy for a representative collection of Roses arranged on a space thirty feet by four feet, with a very effective exhibit of pillars, baskets and vases of clear, bright blooms, his leading varieties being Emma Wright, Dr. Van Fleet, Betty Uprichard, Glory of Hurst, Joseph Liger, Edith Cavell,

Independence Day—very fine—Lady Inchiquin, Shot Silk, Golden Emblem, Joanna Bridge, Angele Pernet, Queen Alexandra and a very fine pillar arrangement of Francois Juranville.

The first prize for a smaller group was won by Mr. GEORGE PRINCE, whose sheaves of I. Zingari, Betty Uprichard, Isobel, Gweneth Jones, Los Angeles, Scarlet Climber and Golden Emblem were particularly good. Mr. PRINCE also included a bowl of the pretty little yellow Rose Hardii. The second prize fell to Mr. J. H. PEMBERTON, who showed Pax, Penelope, Prosperity, Padre, Moonlight and other excellent varieties in good style. Mr. H. DREW was third.

OPEN CLASSES.

Mr. J. MATTOCK exhibited the best five baskets of cut Roses, thirty-six stems of each of five varieties; he won with fresh flowers of Mrs. H. Morse, Mrs. T. Gilby, Lady Inchiquin, Louise Criner and Mrs. H. Bowles. Messrs. A. DICKSON AND SONS were placed second with Sunstar, Lady Inchiquin, Betty Uprichard, Shot Silk and Lady Worthington Evans; Mr. H. DREW, third, with Mrs. H. Morse, Lady Inchiquin, Red Letter Day, Betty Uprichard, and Mrs. C. V. Haworth.

Mr. E. J. HICKS gained first prize for three baskets of Roses, his varieties being Emma Wright, Betty Uprichard and Independence Day.

The best two dozen varieties of Roses, from three to seven stems of each, in vases, came from Mr. J. MATTOCK, whose best blooms were those of Emma Wright, Golden Emblem, Mrs. E. Van Rossen, Mrs. Mocatta and Lady Roundway; Messrs. FRANK CANT AND CO., second.

Mr. E. J. HICKS succeeded in winning the leading award for thirty-six exhibition Roses in boxes, and a few of the leading sorts were Mrs. Foley Hobbs, Mrs. G. Shawyer, Charles E. Shea and Marcia Stanhope; Messrs. F. CANT AND CO., second. Mr. PRINCE led for two dozen exhibition blooms, with Mr. H. DREW second; while for a dozen exhibition flowers, Messrs. FRANK CANT AND CO. won premier honours.

For one basket of exhibition Roses, Mr. G. PRINCE led with Mrs. H. Morse, and Mr. J. MATTOCK came second with Gwyn Carr. The best basket of Mrs. George Marriott was shown by Mr. J. MATTOCK, who had capital flowers. Mr. DREW was the most successful exhibitor of two baskets of exhibition Roses, winning with George Dickson and Mrs. McLennan.

AMATEURS' CLASSES.

Mr. J. H. HART, Potters Bar, was successful in winning the Amateurs' Jubilee Trophy for a display of Roses arranged on a space five feet by three feet. He had a capital exhibit in which large sheaves of Mrs. Dunlop Best, Mrs. Charles Lamplough, Mrs. E. G. Hill, Mrs. H. Morse and Augustus Hartmann were the leading features; the arrangement was good; second, Mr. GEORGE MARRIOTT, Carlton; third, Miss BEDFORD PIM, Shoreham. Mr. G. MARRIOTT had the best two baskets of flowers, and Mr. GAIGER the best single basket.

Mr. HART was also successful with exhibition Roses on boards, leading for twenty-four blooms with a capital set. Mr. J. E. RAYNER was first and Mr. FORREST second for twelve blooms, while for a dozen blooms, open to smaller growers, Mr. ALAN GIBBS won the chief award: the last-named also showed the best single basket of mixed varieties.

Mr. ALAN GIBBS had a capital set of six blooms, winning first prize with Hugh Dickson, Frau Karl Druschki, Earl Haig, Mrs. H. Bowles, Mabel Morse and Mrs. H. Morse; second, Mr. BEDFORD PIM; third, Mr. E. J. BAKER. Mr. ALAN GIBBS, Mr. R. F. FORREST, and Miss HOPCROFT, won the prizes in the order given, for six blooms, in the class for those who had never won a first prize at a N.R.S. show.

Mr. F. TRINDER, Mr. J. G. ORPEN, Mr. N. FLETCHER, Mr. E. C. RICHINGS, Mr. H. CLARKE, were other successful competitors.

DECORATIVE EXHIBITS.

The competition was keen for the prizes in the class for a dinner table decoration of Roses. Miss NEWSHAM gained the premier award

with a bright arrangement of fine flowers of Independence Day, Mr. COURTNEY PAGE coming a close second with Emma Wright; Mrs. COLSTON HALE, third, with Angele Pernet, and Miss S. N. ZELLEY, fourth.

Mr. COURTNEY PAGE led for a bowl of Roses with lovely blooms of Roselandia; Messrs. NEWSHAM second, and Miss ZELLEY, third. Mr. COURTNEY PAGE was also first prize winner in the class for a vase of Roses, showing Shot Silk in fine style; second, Miss ZELLEY and third Miss NEWSHAM. In the novice class for a bowl of Roses, Miss E. P. JONES, Miss M. F. HOPE-CROFT and Mrs. MACKELROY, won the awards as placed.

Mr. J. MATTOCK had the first prize bowl of Roses (nurserymen) and also the best vase of Roses.

WINDSOR, ETON AND DISTRICT ROSE AND HORTICULTURAL.

JULY 9.—The thirty-fourth annual show of this Society, which was held in the Slopes of Windsor Castle, was the most successful of recent years. The entries were more than double the number of last year, and the quality generally of the exhibits was very high; it only required some exhibits of fruits to make it an ideal show. The rains of the morning ceased at midday, and there was a good attendance. As usual the arrangements worked smoothly, and Mr. J. Harding, the genial Hon. Secretary, and the Committee are to be congratulated on an enjoyable and successful show. In the opinion of the senior judge, it was the finest show held at Windsor during the past twenty-five years. Roses were the principal feature, while Sweet Peas, hardy border flowers, and vegetables were well shown, and there were many tasteful dinner table decorations. The trade materially assisted to make this very attractive show.

OPEN CLASSES.

The show at Windsor is first a Rose show and the handsome Challenge Cup, presented by His Majesty the King in 1919, is the rosarians' most prized trophy.

The King's Cup and a money prize is offered for the best collection of forty-eight Roses in distinct varieties, and Messrs. FRANK CANT AND CO. won it for the fourth successive time with an excellent collection of fresh and well-formed blooms. Their varieties included Mabel Morse, Countess of Lonsdale, Caroline Testout, Gladys Holland, The General, Mrs. Henry Bowles and Courage. Messrs. B. R. CANT AND SONS were a good second, and their best blooms were Jules Bouche, Louise Crette, Lemon Pillar, Coronation, Gwynne Carr and Mr. George Norwood. Messrs. D. PRIOR AND SON were third in this principal class.

Tea and Noisette Roses did not equal the championship class in quality. The blooms were rather small and weather-stained. The first prize was withheld and Messrs. G. LONGLEY AND SONS were awarded the second prize for a collection which included blooms of Mrs. Campbell Hall, Mrs. A. de Rothschild and Caroline Souper.

Competition was very good indeed, in the class for trios of twelve distinct varieties, and here the chief honour was won by Messrs. B. R. CANT AND SONS, who had splendid blooms of Lemon Pillar, Florence Forrester, Mr. Henry Morse, and two new varieties of great merit. These were The Belle, a shapely H.T. of perfect form, fragrance and pale lemon colouring with a pale flesh pink centre, and Alice, an equally good H.T. of deep rose colour. Messrs. FRANK CANT AND CO., were second, and their best trios were St. Helena, The Diety, Mrs. Henry Morse and Courage.

The best twelve blooms of any H.P. or H.T. Rose were those of George Dickson shown by Messrs. GEORGE LONGLEY AND SONS, and this fine exhibit contained the best Rose in the whole of the Show. Jules Gravereaux good quality, as shown by Messrs. D. PRIOR AND SON, was the first prize variety in the class for twelve blooms of any T. or N. Rose. Messrs. A. WARNER AND SON had the best collection of eighteen bunches of Decorative Roses. They showed Golden Emblem, Lady Roundway, Red Cross and Madame Edouard Herriot in excellent condition.

Mr. F. SPOONER, who was second, showed good vases of Betty Uprichard, Ophelia and Marcia Stanhope.

AMATEURS' CLASSES.

In this section the quality of the exhibition in the chief classes was very high. Dr. R. C. TURNBULL, Colchester, had the satisfaction of winning the Windsor Challenge Cup for the third year in succession with twenty-four excellent exhibition Roses. His principal varieties were Lady Inchiquin, The General, George Dickson and Avoca. Mr. F. H. FIELDGATE, Colchester, was second, and he had very good specimens of Mrs. Amy Hammond and Mr. G. Norwood. Dr. TURNBULL also had the best six varieties, showing Florence Forrester, Mrs. C. Lamplough and Miss E. J. Hudson of high quality. Mr. C. H. RIGG, St. Albans, was a good second. Mr. W. E. MOORE, Ickenhams, was first with six T. or N. Roses, and, in the local classes, had the best twelve blooms of the same class of Rose. He also had the best H.T. and the best T. bloom in these classes.

Mr. F. H. FIELDGATE won outright Lady Julia Follett's Challenge Cup with twelve particularly good varieties and also had the best twelve in the class for growers of less than a thousand plants. His chief varieties were George Dickson, Augustus Hartmann, Mrs. J. Laing and Mabel Morse.

Except in the two principal classes, Sweet Peas were not equal in quality to those of recent years, but MAJOR KRABBE (gr. Mr. GOWER), Calcot Grange, Reading, won the Prince of Wales' Challenge Cup with twelve magnificent vases. His principal varieties were Hawlmark Salmon, Constance Hinton, Powerscourt, Youth, Picture, George Shawyer and Wild Rose. Dr. R. C. TURNBULL won the Aird Cup with twelve exceedingly good vases of such varieties as Magnet, Annie Ireland and Mrs. H. Wright. In the local classes there were a dozen or more exhibits of twelve vases in competition for Mrs. Beril Fortescue's Cup, which was awarded to Mrs. G. E. MARSH, Slough, whose collection included the varieties Picture, Youth, Constance Hinton and Pimpernel. In the Cottagers' classes Mr. C. W. RENN, Windsor, had six splendid vases of Sweet Peas.

NON-COMPETITIVE EXHIBITS.

In order to show their appreciation of the value of the trade exhibits, the Committee inaugurated a scheme of Medal Awards for non-competitive exhibits, with the result that trade collections were more numerous and varied than usual. Lady Carter offered a Challenge Cup, which may be won outright in three successive years or any four years, for the best trade exhibit. This year it was awarded to Mr. J. C. ALLGROVE for a very tasteful display of hardy border flowers. This included Eremurus, Delphiniums, Erigerons and Scabiosa in good varieties with Lavatera olbia and Iris aurea. In another tent Mr. ALLGROVE set up an attractive collection of Roses and another of hardy shrubs and border flowers.

A large space was filled by Messrs. WATERER, SONS and CRISP with a magnificent collection of Japanese Irises similar to that we admired at a recent show of the R.H.S. at Vincent Square. Mr. WM. YANDALL had a very large exhibit of his beautiful Violas and Pansies. The former included Pansy Orange Perfection, Lily Stark, W. H. Woodgate, Springwall Bronze, Mosley, Ideal and Mosely Perfection. Mr. CHARLES TURNER grouped Palms, Standard Fuchsias, Heliotropes, Carnations and other plants very tastefully.

A good variety of Hydrangea Hortensia was associated with dwarf Polyantha Roses by Messrs. WM. CUTBUSH AND SON. Amongst the latter the new variety Golden Salmon was very conspicuous. Messrs. HEWITTS, LTD., had a large collection of Delphiniums amongst which the prominent varieties were The Shah, Dusky Monarch, Violet Queen and Lord Derby. Messrs. S. RIDE AND SONS had an extensive collection of fresh Sweet Peas. They included the varieties Youth, Charming, Charity and Winifred McLachlan.

Groups of Roses were staged by Mr. J. H. PEMBERTON, who included large vases of Paul's Scarlet Climber, Pax Variety, Los Angeles and Dorina Neave; Messrs. WOOD and INGRAM,

who had Shot Silk, Christine, Souvenir de Claudius Pernet, and a large quantity of Angele Pernet; Messrs. LUND BROS., who displayed Marcia Stanhope, Lady Inchiquin, Mrs. Henry Morse and Madame Edouard Herriot; Messrs. W. E. B. ARCHER AND DAUGHTER, who showed the pretty Single Dainty Bess, Muriel and Joyous Cavalier; and Mr. GEORGE LILLEY, who had arches of Polyantha varieties and vases of Mabel Morse, Betty Uprichard, Lady Inchiquin and Golden Emblem.

CHELTENHAM FLORAL FETE.

JULY 6 and 7.—Success is attending the efforts of the Cheltenham enthusiasts to revive the former horticultural glories of their beautiful town. The show held on the above dates in the Montpelier Gardens was a distinct improvement on the one of 1926, and the provincial show of the National Rose Society was an added attraction. Four large tents housed the exhibits, one being occupied chiefly by the N.R.S. exhibition. Amateurs, of whom there are plenty in the Cheltenham district, came out well, and one tent scarcely sufficed to hold their exhibits of Roses, hardy flowers, Sweet Peas, Ferns, Begonias, Fuchsias, etc.; the keenness of the competition in this section augurs well for the future success of the fete. Messrs. JOHN CYPHER and Mr. C. CASSIDY were moving spirits of the flower show, and they have a hard working Committee that is now becoming accustomed to the duties of management.

Cheltenham was *en fete* for the occasion, and miles of bunting were suspended between the fine trees that form avenues to the principal streets. Cloudy but fine weather occurred on the opening day, but the sun shone brightly when the Mayor opened the show at noon on July 6.

One criticism we offer. The small cards with class number and exhibitors' number should be scrapped and class cards provided, with the name and address of the exhibitor written on it, together with the class specification; this side should be placed downwards in front of or on the exhibit. On the reverse side the class and exhibitor's numbers only should appear, and here the judge would mark the award made. This method permits much more secretarial work to be done before the show, simplifies matters generally, and is less likely to lead to confusion and error in the awards than the other system. On the front of the card a space should be allowed for the adhesive prize slips which the steward could affix so soon as judging is finished, so that by the opening hour visitors are able to see who has won the prizes. Under the present system it was not possible to determine the prize-winners by lunch time, after which our representative had to return to town.

The Cheltenham Corporation Cup, offered for the best exhibit in the show, was won for the third time in succession by Messrs. JAS. CYPHER AND SON with one of their elegant arrangements of Codiaecums, Palms, Fuchsias, Thunias, Cattleyas, Humeas, Phyllanthus, Nandina domestica and Selaginellas, and so the Cup becomes the property of the famous Cheltenham firm.

The Cavendish Cup was won by Messrs. SUTTON AND SONS with a large exhibit of beautifully-grown Gloxinias, backed by Palms and interspersed with groups of bright, well-grown Clerodendron fallax.

The best collection of perennial and hardy flowers was the large and interesting one submitted by Mr. W. H. WALTERS, Colesborne Gardens, who was awarded the Fifty-guinea Drapers' Cup. This exhibit contained many new and rare plants, including Primula florindae, P. microdonta, Cineraria lobata, with golden flowers, Cypripedium spectabile, the white, herbaceous Clematis palassii, and the large-headed Allium albo-pilosum, besides Liliums, Salvias, Funkias and Sedums.

The Grocers' Cup was awarded to Messrs. J. JEFFERIES AND SON, who had the best display of Roses. This was a very fine exhibit of pillars, baskets and bowls of Roses, the leading varieties being Mrs. H. Bowles, Mabel Morse, Independ

ence Day, Mr. C. W. Edwards, H. V. Haworth. Los Angeles, Mrs. Dunlop West, Souv. de H. A. Verschuren, Emma Wright and Mr. Alistair Clarke's Australian varieties Ruby Ring, Queen of Hearts and Gwen Nash, the last a large, semi-double variety of bright pink colour with white centre. Mr. JEFFERIES also won the first prize for a display of Roses with the same exhibit, and Messrs. ENGLISH AND SON were placed second.

The Master Builders' Cup, offered for the best display of Sweet Peas, was won by Mr. CHARLES Wall, Bath, with a fine, clean lot of flowers admirably staged.

The Sunningend Cup, offered for the best exhibit of Carnations arranged on a space twenty-five feet by five feet, was won by Mr. C. ENGELMANN for the second year in succession, with a beautiful group of fine blooms of popular sorts.

In four classes the Corporation of Cheltenham offered first prizes of £10 each, and the Society added second and third prizes of £5 and £3 respectively. In the class for a display of Roses, Messrs. J. JEFFERIES AND SON were placed first, and Messrs. ENGLISH second. The CHALK HILL NURSERIES led for a collection of hardy perennials with a well arranged exhibit of seasonable border flowers; Messrs. BOWLES AND SKARRATT second.

Mr. C. ENGELMANN was the winner of the award for a group of Carnations, and Messrs. BOWLES AND SKARRATT had the best rock and water garden, which was a very pleasing arrangement, the stones being well-placed, the planting carried out with care, and the background a suitable one; Messrs. MAXWELL AND BEALE, second.

The Gardeners' Chronicle Medal for the best amateurs' exhibit in the show was won by Mrs. BUTLER (gr. Mr. G. J. Collins), Twynning Park, Tewkesbury, with a pretty, artistic display of plants, effectively arranged on a square space at the end of the Rose tent. Mr. COLLINS' design had a central arch furnished with Grevilleas, Ferns, Selaginellas and Fuchsias of the triphylla type, with a tall central Palm. Below and around this feature were handsome Codiaeums, Phyllanthus, Humeas, variegated Abutilons, good Clerodendron fallax, Lilium tigrinum, Odontoglossums, Cypripediums and Cattleyas. The addition of a few small Ferns to hide one or two obtrusive pots would have given a better finish to a good display.

There was keen competition in the table decoration classes, and we were led to notice that there was more amateurs' exhibits of plants and hardy flowers than on the previous occasion, while the children are well catered for and showed about one hundred baskets and vases of wild flowers.

Trade displays were excellent.

MEDAL AWARDS.

Large Gold.—To Messrs. SUTTON AND SONS; Messrs. J. CYPHER AND SONS; and Mr. C. ENGELMANN.

Gold.—To Messrs. HORWOOD, Messrs. BAKERS, Mr. W. H. WALTERS, Messrs. W. H. SIMPSON AND SONS, Mr. W. WELLS and Messrs. J. JEFFERIES AND SON.

Silver-Gilt.—To LONG ASHTON EXPERIMENT STATION, for demonstration of Strawberry diseases; Mr. W. YANDELL, Messrs. FULLER AND MAYLAM, Mrs. BUTLER (gr. Mr. Collins), and Messrs. BOWLES AND SKARRATT.

Silver.—To Mr. C. H. HERBERT, Mr. J. H. WHITE, Mr. R. J. CASE, Mr. PAYNE, Messrs. BOX BROS., CHALK HILL NURSERIES, Messrs. GURDEN AND SON, Messrs. J. SCOTT AND CO., Messrs. WHEELERS, Mr. W. COVILL, Mr. F. RICH and Mr. A. BANFIELD.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

At the monthly meeting of this Society, held in the R.H.S. Hall, on Monday, July 4, Mr. Charles H. Curtis presided. Six new members were elected. Two members withdrew £17 16s. 0d. from their Deposit Accounts

and two lapsed members withdrew the sum of £5 3s. 1d. The sick pay for the month on the Ordinary side amounted to £68 4s. 8d., and on the State side to £62 19s. 4d.; Maternity claims totalled £15.

The sum of £39 1s. 10d. was made in grants to State-insured members for dental and surgical benefits, and ten new cases were considered.

Obituary.

Sir John D. Dillwyn-Llewelyn, Bt., V.M.H.

The death of this venerable gentleman, who may be regarded as the doyen of British horticulture, occurred on Wednesday, the 6th inst., at his home, Penllergaer, Swansea, in his ninety-second year. No man served British horticulture more worthily than Sir John, and no one was more beloved by his fellow men. During recent years, owing to his advanced age, he has not been able to give such close attention

THE LATE SIR J. D. LLEWELYN.

to horticulture as in the past, but he still maintained a lively interest in his garden, and the activities of the societies with which he was connected. So long ago as 1891, he was elected a member of the Council of the Royal Horticultural Society, of which he was a keen supporter, and a member of the Scientific Committee. He was for many years President of the Horticultural Club and he associated himself with most of the special societies connected with gardening. He was President of the now defunct National Potato Society, a Vice-President of the National Chrysanthemum Society, and the National Carnation and Picotee Society, also a patron of the National Dahlia Society. He was elected a Victorian Medallist of Honour in Horticulture in 1907. The deceased nobleman was born in 1823, and was sent to Eton in 1846. He left Eton in 1850 and went to Christ Church, Oxford, where he took honours in natural science. In 1890 he was created a baronet. He was prominent in civic, social and political work and a keen lover of sport. In 1891, he was Mayor of Swansea, and in 1895 was elected Conservative member for Swansea Town. Sir John was for some years captain of the South Wales cricket eleven, and president of the Welsh Rugby Football Union. He leaves a son, Lt.-Col. Charles Leyshon Dillwyn-Venables-Llewelyn, who succeeds to the baronetcy.

ANSWERS TO CORRESPONDENTS.

BRANCHED TULIPS.—G. B. Although Tulips with branched stems are not commonly seen in gardens, they are by no means rare; indeed, there is a strain in which the production of several flowers on one stem is quite a usual occurrence. Branched Tulips were illustrated and described in *Gard. Chron.*, May 15, 1909, page 317.

CULINARY PEAS FAILING.—A. B. The young Pea plants are attacked by the fungus *Thielavia basicola*, which is the cause of the dark colour and rotting of the roots.

GARDENER'S REFERENCE.—F. O. A servant is not entitled in law to demand a reference however long his service may have been, but this is seldom refused, unless there has been misconduct, and no doubt your employer will give you a reference if you ask him.

MUSSEL SCALE ON PALM LEAVES.—R. C. F. The Palm leaf sent is affected with Mussel Scale. When only moderate numbers of scales are present they may be removed by scraping and scrubbing the affected parts with some strong specific, such as caustic alkali. When using this strong chemical, the hands should be protected with a pair of gloves. If the plant is very badly affected we advise you to destroy it on the garden fire.

NAMES OF PLANTS.—P. O. P. 1, *Euphorbia Lathyris*; 2, *Veronica Traversii*; 3, *Perrettia mucronata*; 4, *Epimedium pinnatum*; 5, *Asphodeline lutea*; 6, *Spiraea Filipendula*; 7, *Potentilla hirta*; 8, *Leycesteria formosa*; 9, *Saponaria officinalis*; 10, *Physostegia virginiana*. W. T. C. *Silybum Marianum*. F. V. N. 1, *Taxodium distichum*; 2, *Cotoneaster salicifolia*; 3, *Spiraea canescens*; 4, *Philadelphus Bouquet Blanc*; 5, *Chimonanthus virginicus*; 6, *Buddleia variabilis*; 7, *Philadelphus Lemoinei erectus*; 8, *Viburnum rhytidophyllum*. E. J. M. Scrappy specimens and badly packed; 1, *Mackaya Bella*; 2, *Rhododendron* species; probably *R. Keysii*; 3, *Iris*, species not recognised; 4, *Muehlenbeckia complexa*; 5, not recognised. Interested. 1, *Matricaria inodora flore pleno*; 2, *Pentstemon Scouleri*; 3, *Cycas revoluta*. E. R. A. Y. 1 and 3, *Hemerocallis fulva*; 2, *Teucrium fruticans*; 4, *Senecio Greyi*; *Lilium umbellatum*; 6, *Phlomis fruticosa*; 7, *Streptosolen Jamesonii*; 8, not recognised; 9, *Veronica Chamaedrys*; 10, *Dianthus* species.—H. S. English *Iris*, Grand Lilas. K. V. E. 1, specimen too scrappy; 2, *Picea pungens*; 3, cannot name Ferns without spores; 4, *Chrysanthemum Parthenium flore pleno*; 5, *Lysimachia punctata*; 6, *Cryptomeria elegans*; 7 and 8, *Nephrodium Filix-Mas*; 9, *Chlorophytum elatum variegatum*; 10, *Pteris tremula*. R. F. F. *Salvia Grahamii*.

NECTARINES UNSATISFACTORY.—C. H. H. The external marks on the fruits are due to rubbing, which has injured the delicate skin. The splitting is usually due to heavy watering following a dry period, which causes the fruits to take up suddenly more water than they can hold. They do not appear to be affected by any disease or pest.

PEACHES AND NECTARINES FAILING.—R. W. G. The cracking of the Nectarine is not due to any parasite, but is undoubtedly due to some cultural error, such as excessive watering followed by a period of drought. The Peach is affected by scab disease, caused by the fungus *Cladosporium carpophilum*. Spray the trees with lime-sulphur at summer strength.

Rhododendron yedoense.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 63°3'.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 20, 10 a.m. Bar. 30.3. Temp. 63°. Weather, Showery.

REFERENCE has already been made in these pages (March 19, p. 187, Vol. LXXXI) to the now well-known fact that green-keepers in the United States have managed to produce perfect putting greens on their golf courses in spite of the fact that a continental climate is less favourable to the growth of grasses than is an insular climate, such as our own. The progress made in this direction in America is, indeed, so great that unless we take care the pre-eminence of this country for its lawns may go the way of our one time pre-eminence in the games played on them. The method which has led to the remarkable excellence of the golf greens in the United States is based on the

recognition—we might almost say discovery—that the fine grasses suitable for golf greens thrive best in an acid soil; that is, under conditions which are repugnant to most cultivated plants. This discovery has been applied to the perfecting of golf greens and courses by taking advantage of the well-known fact that certain artificial fertilisers, such, for example, as sulphate of ammonia and ammonium phosphate, augment soil acidity. To bring this about liberal and repeated applications of one of these fertilisers are applied to the greens, the fertiliser being spread evenly and washed into the soil. Having regard to the results already obtained in the United States and in Canada, it seemed desirable that experiments should be made in this country in order to ascertain whether the method would prove successful here. Mr. Norman Hackett had already applied the method on the Keighley Golf Course with marked success (see *Golfing*, September 6, 1926), but a need still remained for further tests. Mr. Lane Jackson, Hon. Secretary of the Stoke Poges Golf Links at Stoke Park, Slough, who has an unrivalled knowledge of golf and of green keeping, was good enough to put certain greens, fairways and lawns at the disposal of Nitram, Ltd. for the purpose of experiment. The experimental areas were selected in April of this year and have been treated with successive dressings of sulphate of ammonia, similar neighbouring plots being left untreated in order that they might serve as controls. The dressings of sulphate of ammonia mixed with twice their volume of sand, were put on at fortnightly intervals at the rate of 5 lbs. per 1,000 square feet. Of the control plots, one received an equivalent amount of sand only, and the other nothing at all. Beside the plots on the golf greens and fairways there were others on the croquet lawn and on the lawn leading from the Club House to the first tee. Our illustration (Fig. 24) shows the striking effect of the successive dressings of sulphate of ammonia on the last-named lawn. Daisies have been so checked on the treated plot that not one flower is to be seen. By June, the observer in charge of the experiment reported that the strip was by that time free from Daisies and all other weeds. The result here is the more valuable in as much as it shows that the method of supplying uniform successive dressings is much better than the weed-killing method of making heavy applications of sulphate of ammonia irregularly over Daisy patches. That was done on either side of the strip and was effective in killing out the Daisies, but resulted in patchiness which the illustration shows in striking manner. Careful records of the weed flora and state of soil with respect to acidity are being kept, and will be published in due course. Already, however, the "painless extraction" of weeds by the sulphate of ammonia treatment is in evidence. Counts over measured areas of the plots under experiment show that in two months the treated patches lost fifty per cent. of their weed flora, whereas on sanded or quite untreated control plots the weed population had in every case increased. Accurate soil-acidity determinations are also being made, and there is evidence that the repeated dressings of sulphate of ammonia have already increased the soil acidity. This interim report of the results of the Stoke Poges experiment would appear to show that where water is available our greens and lawns may be improved rapidly by successive dressings of sulphate of ammonia or other "acid" manure. Applied at the rate already indicated, there is no risk of damage unless

watering is neglected. Even where water is not available, the method may be employed provided that the dressings are applied at the advent of showery weather. We hope that not only green-keepers, but also those in charge of the green swards in London parks and in College courts and quadrangles will take note of these simple means of improving their lawns. The lawns of certain colleges in our old Universities, once our pride and the cynosure of every American eye, are now, alas, in many cases, fallen into the sere and yellow. It is time that they, too, were renovated, and if final results of the Stoke Poges experiments confirm the conclusion reached in this interim report, there is a ready and simple means of doing it.

Horticultural College, Swanley.—Speech Day of the Horticultural College, Swanley, Kent, is fixed for Thursday, July 28. At 3.30 p.m. the Rt. Hon. Lord Cornwallis, C.B.E., chairman of the Kent County Council, will present the diplomas and certificates to the successful students.

A New Public Park for Bathgate.—On June 25 the Rt. Hon. Sir John Gilmour, Secretary of State for Scotland, opened a new public park at Bathgate, on the Kirkton estate. Lodge Park, as the field is locally known, has an area of eighteen acres and was included in the purchase of Kirkton estate by the Town Council in 1914. The whole of the work of laying out the park and making of the bowling greens and tennis courts was done by direct labour and so far has entailed an expenditure of £3,300. The park superintendent, Mr. James Brown, has been responsible for the construction of the various ornamental plots, flower beds and shrubberies, and no fewer than 3,000 shrubs have been planted already.

Appointment.—Dr. R. W. Thatcher, for the past six years Director of the State Agricultural Experiment Station at Geneva, N.Y., has resigned as head of that institution to accept the presidency of the Massachusetts Agricultural College at Amherst, Mass. Dr. Thatcher's resignation will become effective on September 1. The Massachusetts Agricultural College is the second oldest agricultural college in the United States, the Michigan Agricultural College being the first institution of its sort in that country. The Massachusetts college enjoys a high prestige, and has among its alumni many men prominent in agricultural affairs.

Crops in France.—A report received by the Empire Marketing Board states that continued drought has seriously affected fruit crops in the Department of Var, and that yields are much below normal. The gathering of Plums and Greengages has begun, but the yield is only moderate, and the quality is below that of last year. It is an excellent season for Tomatos, quantity and quality being much above the normal. French Beans are giving good crops, and very little disease is reported.

Scottish Sweet Pea Trials.—The Sweet Pea Trials conducted by the Scottish National Sweet Pea, Rose and Carnation Society at Helmsburgh, were open for inspection to members on Saturday, July 9. There were eighty-nine varieties not yet in commerce, and raisers from England, Scotland, Ireland, the United States and Canada were represented. The seeds were sown in the middle of October—about two weeks too late for Scotland; the seedlings were planted out on March 31, and grown on the single-stem principle. Considering the backward season, the growth and display of bloom was remarkably good, but the quality of the flowers suffered in comparison with that of previous seasons. Four-flowered spikes were the exception rather than the rule, while unfixed varieties were exceptionally numerous, single sports being found in some stocks and so many as three

and four in others. The white class was particularly disappointing as not one of the seven examples on trial could lay claim to purity of colour. Lavender and purple varieties were inferior in size and colour to the 1926 entries, and the best are unlikely to supersede the starred sorts in the official classification lists. Pink shades predominated; of the twenty-five varieties in that section, fourteen came under the category of cream-pink, and of the total possibly three or four may ultimately be included in the list of honours. The cerise class contains several promising varieties. Mrs. A. Searles was not seen at its best, and of the remaining ten varieties Mr. J. Stevenson's deeper shaded Coralline and No. 8 were outstanding. The latter was quite true, and it was one of the few varieties which was credited with four well placed blooms on a long, stout stem. The only orange Sweet Pea in the trials was not up to exhibition standard, but a large, wavy, orange-scarlet sort with double standards should be well placed in the judges' pointing. Blue shades were well represented, but the majority will require to show improvement to be included in the chosen selection. Boy Blue had a rogue, and No. 23 was a mixture of four distinct colours. The best of the class was a large dark blue of strong growth, and No. 86 is among the probables. Sunkist, a cream-ground Youth, does not seem to withstand bad weather, but two good sorts were included among the Fancies. Perhaps the most distinct Pea in the trials was No. 41, classed as a lilac. It is difficult to describe, as it is not a self and the blooms, though of medium size, are nicely formed. Petunia contained three sports, and Strawberry did not justify its name. Of the two crimsons one possessed merit both as regards colour and form. The trials will be visited on two other occasions prior to the date of the show and before the awards are made.

Ayrshire Potato Crop.—Merchants who purchased growing crops of Epicure Potatoes at the recent auction sales are reported to be making good profits from the transactions. Prices are averaging about £11 per ton and the demand is such that over 1,000 Irish harvesters are employed in the work of digging in the area between Ayr and Ballantrae, and for the first occasion for many years they have been working overtime. Up to the end of June, the crop averaged about six tons to the acre, but with warmer weather, accompanied by moist conditions, the tubers have developed to the extent of yielding nine and ten tons to the acre. Farmers who sold their crops are bemoaning their ill-luck, as it would have paid them handsomely had they retained their Potatoes and marketed them by weight instead of disposing of them by the acre.

National Diploma in Horticulture.—The Royal Horticultural Society's National Diploma in Horticulture has been awarded to the following as a result of the written and practical examinations for the Diploma held this season. Section I, General Horticulture:—Mr. Harry E. Brooks, Chewton Priory Gardens, Chewton Mendip, Bath; Miss K. A. Clarke, 1, Claremont Terrace, Hextable, Kent; Mr. William H. Frentiman, Drill Hall Lane, Cranbrook, Kent; Miss D. M. Garstang, Studley College, Warwickshire; Miss E. G. Horrell, The Grange, Thorney, Peterborough; Mr. Robert H. Jeffers, 23, Bell Place, Edinburgh; Mr. Raymond W. B. Keene, Ramil, Hatfield Road, St. Albans; Mr. William McCarrell, The Gardens, Deanston House, Doune, Perthshire; Miss Annie Newton, Martindale, Tubbenden Lane, Farnborough, Kent; Mr. Edgar R. Saltmarsh, Somerset Farm Institute, Cannington, Bridgwater, and Mr. George L. Sowter, The Gardens, Heacham Hall, Heacham, King's Lynn. The following have passed the Preliminary Examination, and will be eligible to take the Final Examination when they have completed the necessary six years of practical experience in gardening:—Mr. Allan V. Batley, 83, Balfour Road, Normanston, Derby; Mr. T. Dickson Boyd, 6, Clarence Road, Kew; Mr. J. William Breed, A.V.T.C., Catterick Camp, Yorks.; Mr. William A. Crighton, Inverbay, Invergowrie, by Dundee;

Mr. A. A. Culham, 79, Gladstone Road, Wimbledon, S.W.; Miss J. E. C. Emvey, 15, Belvoir Road, St. Andrews Park, Bristol; Mr. Thomas H. Everett, Greystone Yonkers, New York, U.S.A.; Mr. William G. Fry, 14, Gainsboro' Road, Richmond, Surrey; Miss H. M. Greene, Huntworth, Stoke Bishop, Bristol; Mr. Albert E. Johnston, 9, Whaley Terrace, Enniskillen, Co. Fermanagh; Mr. Hugh R. McGlashan, 1, Bell Place, Edinburgh; and Miss Ida M. Rowley, 12, Bestwood Park, Clay Cross, near Chesterfield.

Mr. Frederick Copley.—The subject of this note is the Superintendent of the Mirfield Parks and Recreation Grounds. The town of Mirfield used to be one of the most rural centres in the "heavy woollen" district of Yorkshire, but buildings are being erected so rapidly that the rural characteristic will soon have passed away. Ings Grove Park is the principal open space in the town, and one of its most

MR. F. COPLEY.

delightful features is a War Memorial Scheme. This takes the form of a large Runic Cross which is surrounded by a rockery in a Rose garden. Mr. Copley is keenly interested in alpine plants, and he maintains an up-to-date collection of these and also Roses, which are very successful on the somewhat heavy soil. The herbaceous garden, which is divided into several large areas, is much appreciated by the public of Mirfield. A comprehensive collection of species is grown, but Mr. Copley is specially interested in Tritomas and Michaelmas Daisies. When these are in bloom they constitute a fine display. Thousands of Crocuses, Tulips and Daffodils make a bright display in spring, and these are succeeded by an equally bright summer-bedding arrangement. The Mirfield Memorial Park of fourteen acres is devoted exclusively to games, and is a very popular open space. Mr. Copley was appointed Superintendent of Parks and Recreation Grounds in 1919. For many years prior to that date he was head gardener to the late Edwin Theodore Ingham, Esq., of Blake Hall, Mirfield, one of the few estates on which there were Pine stoves until a very recent date. Mr. Copley has seen this fine old place pass into the hands of the builder. His prentice days were passed in the gardens of W. F. Lee, Esq., Grove Hall, Knottingley; C. H. Simpson, Esq., Moor Top House, Ackworth; and Samuel Hirst, Esq., of Kellington.

National Playing Fields.—Although there has been a generous response to the Duke of York's appeal for National Playing Fields, many gifts

of money and land are needed ere the £1,000,000 aimed at is reached. Many schools and clubs have contributed sums that, although comparatively small individually, are considerable in the aggregate, but, so far, only the fringe of this source of revenue has been touched. Local branches of the National Playing Fields Association are springing up in all directions, but here again there is room for a wider response to the appeal; where local interest has not yet been stirred, there is an opportunity for some enthusiastic sportsman to work up enthusiasm and secure donations. Many large business firms have made liberal donations and county associations are busy gathering in both small and large gifts. A recent gift is one of ten acres of land made by Mr. F. Ransom, of Hitchin. Full particulars of the appeal, and the need, together with literature on the subject, may be obtained from Mr. Noel Curtis-Bennett, N.P.F.A., 166, Piccadilly, W., to whom donations may be sent.

The Fruit Crops.—Will readers who have consented to furnish reports on the hardy fruit crops and have not yet returned their forms, kindly do so as soon as possible, as the statistics will be published in an early issue in August.

Cambridge University Press.—An arrangement has recently been made between The Cambridge University Press and Duke University Press of Durham, North Carolina, U.S.A., under which The Cambridge Press will act as Agent in this country for the sale of the publications of Duke University Press. A full announcement will be made, and a first list of books given, in the October number of *The Cambridge Bulletin*, which may be obtained free of charge from The Cambridge Press, Fetter Lane, E.C.4.

Foremarke Cup for Gladioli.—The annual competition for the Foremarke Challenge Cup offered for Gladioli will take place at the Royal Horticultural Society's fortnightly show at Vincent Square, Westminster, on August 16. The Cup is offered for the best twenty spikes of named Gladioli in not fewer than ten varieties. Not more than two spikes of any one variety may be shown. The competition is open to both amateur and trade growers. Entry forms may be had on application to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.1, by whom the completed forms must be received not later than the first post on Wednesday, August 10, 1927.

Legacies to Gardeners.—The late Mrs. Charlotte Isabel Slater, of Summerfield, Lower Howsell, Malvern, who left £100,860, bequeathed £350 to her "faithful servant and gardener," Mr. William Williams.—Mr. Henry Abbott, Broad Green, Liverpool, whose estate was valued at £11,399, left £100 to his gardener, Mr. Walter Hope.

Fifth International Botanic Congress, 1930.—The fifth International Botanical Congress will be held in Cambridge about the middle of August, 1930. The Executive Committee considers that botanists attending the Congress should pay a membership fee, probably of £1, but in view of the considerable expense involved in the organisation of the Congress it is necessary to have a fund immediately available. The Committee believe that British botanists and others interested in the Congress will be prepared to subscribe to such a fund (additional to membership fees), and suggests that such subscriptions might take the form of an immediate donation also, if possible, a guarantee of a further sum if required. All contributions and promises should be sent to the Hon. Treasurer, Dr. A. B. Rendle, British Museum (Natural History), Cromwell Road, London, S.W.7.

Potatoes from Spain.—The Spanish Government has authorised the export of a further 10,000 tons of early Potatoes, bringing the total quantity authorised to 50,000 tons. The extra 10,000 tons now authorised are to come from the Valencia region.

RHODODENDRON YEDOENSE.

Appointments for the Ensuing Week.—**TUESDAY, JULY 26:** Dorset Horticultural Society's show (two days). **WEDNESDAY, JULY 27:** South County Dublin Horticultural Society's show; Chesterfield Horticultural Society's show; Porthcawl Horticultural Society's show (two days); Haywards Heath Horticultural Society's show (two days). **THURSDAY, JULY 28:** Royal Lancashire Agricultural Society's show (four days); Paisley Florists' Society's meeting. **FRIDAY, JULY 29:** Royal Welsh Agricultural Society's show (four days); Peel Park Flower Show and Gala (three days). **SATURDAY, JULY 30:** Harrogate and District Horticultural Association's show; St. Ervan

crushing ounces at every step. and I am not certain that Mr. Beach's Queens are not altogether different from those of others, as I myself have often found my beds sport. Upon this point, however Mr. Beach is silent; the colour was very fine all round with no white points. I remarked that Mr. B. is enlarging his pond at the top of his grounds; when finished, it will be about sixty to seventy yards long, twenty to thirty yards wide, and from six to eight feet deep where the beautiful clear soft springs, to the amount of twenty, are continually flowing into it, rising, no doubt, from the high grounds above, where the late Sir Joseph Banks lived. The portions of his grounds mentioned by me last year as being under Osiers, has been made

are all, even the smallest, put into 1, 2, 3 and 4 lb. punnets, for the gathering of which his women receive a halfpenny per punnet, and even at this rate they make 20s. a week, between Strawberries and other fruits, such as Raspberries, Gooseberries, Currants, etc. It may be worthy of mention, that his Pear and Apple trees are loaded with fruit, while we on the Surrey side have hardly any. One very important thing which I noticed was, that all his Strawberries, except the Queens, were mulched with straw. I asked the reason why the Queens formed an exception? He said that the early ones had shorter fruit stalks, and were ripe before the runners covered the ground; but that the Queens coming in late covered the

Showing the value of dressings of sulphate of ammonia in eradicating weeds and improving the grass.

(see p. 61).

and District Garden Show; Newburgh and District Flower show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Cultivation of the Strawberry.*—Mr. Beach, the now well-known Strawberry grower, of Worton, Isleworth, having astonished everyone last year, at Chiswick and in the Crystal Palace, with his extremely large fruit of first-rate flavour, granted me the favour of again seeing his grounds this year. By July 14 he had picked a great many, but for all that the crop surprised me, more especially the rows running parallel with the lowest part of the ridges. Walking amongst them was quite impossible without

into ridges, which are now occupied by a fine crop of Ash-leaved kidney Potatos, all ready to dig up; and the moment the Potatos are off, the ridges are to be planted with Strawberries, in rows two feet six inches apart, and one foot six inches asunder in the rows. These new ridges are not made so high in the middle by one foot as the old ones, which are three feet high, Mr. B. having found that the rows at the lowest part of the ridge had always produced not only the largest fruit, but by far the heaviest crop. An important mistake which I made last year is that of this ground the longest square runs south, consequently the ridges must run east. Mr. Beach's Queen Strawberries

ground with runners by the time the fruit was ripe. Another thing I observed was, the whole ridges of Strawberries were lying as it were dead ripe, what many growers would have had gathered days before—this again is a point greatly in favour of colour and flavour; we are generally too fast in picking all sorts of fruits and your remarks in regard to the fruits exhibited at Chiswick fully prove this. I hope that not only myself but all other growers, may benefit by Mr. Beach's experience, which has been acquired at no ordinary amount of expense, coupled with great industry and perseverance. *James Cuthill, Camberwell. Gard. Chron., July 24, 1852.*

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Miltonia vexillaria.—This Orchid, together with its varieties and numerous hybrids, has few equals among flowering plants for making a brilliant display over a long period. Under proper conditions they are mostly vigorous and easy to grow, if a few simple rules are observed. Miltonias, as cut blooms, have a short life, but the flowers last for a considerable time on the plants, even in a dwelling-house, and the latter may be used for indoor decoration provided they are not allowed to remain too long or become dry whilst there. Strong plants start into growth before the flowering period is over, and by the time the flowers have faded, the plants will be ready for re-potting. The roots should never be allowed to suffer from lack of water, even when at rest. Plants which produced their flowers early in the season and were rested slightly have made considerable progress and may have attention at once, whilst those that are later may be repotted at a subsequent period.

Potting.—Miltonias are best repotted annually, for, if the compost is at all sour and decayed, there will be a general decline in the vigour and vitality of the plants. Vigorous specimens that require more root-room should be placed in larger pans with as little root disturbance as possible, taking care that they are not over-potted. Exhausted plants, or those that have become ragged or weak in the centres, are best divided and the portions placed in small receptacles. It is advisable to take every opportunity of increasing the stock of choice and rare varieties, therefore the back pseudo-bulbs removed during the process of re-potting should be placed on damp moss, or even in small pots, when they will make new growths and soon become healthy specimens.

Compost.—A suitable potting material consists of equal parts of Osmunda fibre, A.I. fibre, and Sphagnum-moss, with half-decayed, broken leaves added. The receptacles should be well-drained, and as the plants are surface rooters too much depth of material should not be given them. *M. vexillaria*, and the greater number of its hybrids, thrive best in an equable temperature throughout the year, hence it is a good practice to grow them in an Odontoglossum house temperature during the summer, and in a house with a warm intermediate temperature during the winter. Thrips must be kept in check at all times.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Dwarf and Runner Beans.—These crops have made very slow growth and, on the whole, look very sickly. The Dutch hoe should be used freely to stir the soil between the rows and thus allow the air and warmth to penetrate more easily. Keep a sharp watch for slugs, as these pests are especially destructive during wet weather.

Peas.—A dressing of superphosphate sprinkled alongside the rows and well stirred in the soil with the Dutch hoe, will prove very valuable in assisting the crop of Peas generally, especially if it is applied during showery weather just before the plants come into flower.

Early Potatos.—The tubers should be lifted so soon as they are sufficiently matured. Do not wait for the foliage to die down. A good test to prove whether the crop is ready is to lift a few roots from various parts of the bed, and if the tubers leave the stems easily when gently shaken, and the skins are sufficiently set, there need be no fear but that the Potatos will remain firm and keep well. If tubers

are being saved for seed purposes, care should be taken to select those of the most suitable size and quality. After the crop is cleared and the ground forked over and levelled it may be used for growing salads, Turnips and other crops that need to be sown or planted now.

Winter Onions.—So soon as the bulbs are fully matured, the stems should be carefully bent over to assist the ripening process, and so soon as this is effected the crop should be lifted. The Onions should be perfectly dried before storing them. These bulbs, if carefully handled, will keep much longer than is generally believed.

Leeks.—This useful vegetable should now be planted in quantity on rich ground. Make holes with a bar or dibber, to a depth of about ten inches or twelve inches, and leave the hole open. Simply place the plant in the hole, add just sufficient soil to cover its roots, and fill the hole with water. This method will produce good Leeks, on much less space than the usual way of growing them in trenches, as the space allowed need not be more than fourteen inches between the rows, and ten inches to twelve inches between the plants. As the stem grows and fills the hole it will become perfectly blanched, thus saving the labour of earthing up.

Hoeing.—Use the Dutch hoe on frequent occasions amongst all growing crops, not only to keep down weeds, but also to conserve the soil moisture during dry weather.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brockett Hall, Hertfordshire.

Freesias.—To obtain an early batch of these beautiful flowers, a few bulbs should be potted now. It is undesirable to pot the whole of the stock at this early date; where a very late batch is required it will be safe to leave the remaining bulbs until about the last week in August or the first week in September, thus prolonging the season of flowering so much as possible. Freesias delight in a fairly rich soil with thorough drainage. Pots varying from five inches to six inches in diameter will be suitable; if the smaller receptacles are used, place six to seven bulbs in each pot, while the larger will accommodate nine to ten bulbs. After potting the bulbs, stand the pots on a bed of ashes in a cold frame and give the soil one good watering. Afterwards cover the pots with finely-sifted leaf-mould to the depth of half-an-inch, or cover the frames with some material to exclude the light until growth commences, when it should be removed. For general purposes, *Freesia refracta alba* is still one of the best for early forcing. Do not attempt to force growth with fire-heat to obtain early flowers, rather let the plants develop steadily in a cool house near the roof-glass. Some of the newer varieties should be included, but these I would advise to be grown for later flowering.

Lachenalias.—These plants require much the same treatment as recommended for Freesias, but different pots, as they need a more shallow rooting-medium. Pots four-and-a-half inches in diameter will be large enough, while shallow pans will be found to suit them admirably.

Other Bulbs for Forcing.—To be successful with Roman Hyacinths, Paper White Narcissus and early Tulips, much will depend upon when the bulbs are obtained. Early ripened bulbs of these subjects may be procured by the end of the present month or early in August, and where the order has not been forwarded to the bulb merchant it should be sent at once. *Iris tingitana* is a very useful subject to grow, and may be had in flower at Christmas, if a cool greenhouse is available. To be successful with this plant it must not be subjected to heat, but grown in quite cool conditions.

Souvenir de la Malmaison Carnations.—If the work of layering these Carnations has not been completed, it should be finished at the earliest possible date with a view to obtaining good rooted plants in pots by early autumn.

To obtain good plants it is necessary to take layers from young, healthy stock, and not from plants that have been grown in pots for two successive seasons. Where it is intended to grow a batch of one-year-old plants, the work should be proceeded with at an early date. They will then become well-established in the new compost by the autumn. Do not use rich soil; good open loam, mixed with plenty of old mortar rubble and coarse sand, is all that is required.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Peaches and Nectarines.—Most of these trees are making plenty of young wood, and the fruits, of which there is a good crop, are swelling satisfactorily. Keep the foliage clean and free from red spider. Feed the roots liberally with liquid manure or some good artificial fertiliser to assist the trees before the fruits are too advanced. Examine the young growths at intervals and remove any that can be spared to give the others every opportunity to develop and mature by the end of the season, securing the latter neatly in position. The pruning or thinning of the young shoots may be done when they are being trained in position, retaining only sufficient for furnishing the space. The fruits of Alexander, Waterloo and other very early varieties are approaching ripeness and should be gathered a little under ripe, for if they are allowed to ripen perfectly on the trees they will be very liable to crack, especially in dull, wet weather, and the flesh will become dry.

Apples.—The majority of Apple trees are bearing very heavy crops of fruit, and although a goodly number of the smaller fruits may drop, where practicable the number should be reduced, according to the growth and strength of the trees and the size of the varieties. Thinning is especially necessary in the case of choice dessert varieties and large fruiting sorts. Reducing the crop also enable the trees to form strong fruit buds for next year's growth. All trees bearing heavily should be mulched and fed liberally at the roots to encourage strong growth and increase the size of the Apples.

Cordon Apples.—Simple and double cordons are often trained on single wires about fifteen inches high by the side of paths in the fruit and vegetable garden. By selecting good kinds grafted on the Paradise stock, and training them in this way, good crops of choice fruits may be obtained. Young trees should not be cropped too heavily; in thinning the fruits remove the smallest specimens and any that are badly placed. Those left to mature should be fully exposed to the sun to obtain high colour and good quality in them. Mulch and water the roots freely if the land is light and porous.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Pears, Plums and Cherries.—The young shoots of maiden trees that were potted last autumn and plunged out-of-doors on a warm, open border should be kept closely pinched at the sixth leaf in the case of pyramids, and the leaders at every foot as they ascend. If laterals and sub-laterals develop these may be pinched and repinched to a single leaf, first to divert the sap to the buds nearest the main stem, and second to expose them to the ripening influence of sun-heat and air. The pots, eight inches or nine inches in diameter, being well filled with roots, mulch the latter with decayed manure, water them copiously, and syringe the foliage in the evening.

Early Vineries.—Early vines that have been cleared of their fruits should be syringed liberally late on fine evenings, using a little soft soap and sulphur occasionally where spider has been troublesome. Inside borders which have been allowed to become rather dry should

be made moist again; if the soil is hard prick it over lightly with a fork to ensure even distribution of the water. Clear water is suitable for young and vigorous vines, but older vines will require more generous treatment as the great tendency in their case is premature ripening of the wood and foliage, therefore the syringe may be used fairly freely and the roots given diluted liquid manure. Ventilation should be afforded liberally both day and night.

Successional Vineries.—Houses containing ripe Grapes should be kept cool and airy and lightly shaded for a few hours on bright days if black Grapes are losing their colour. Airy conditions are best for Grapes in the autumn, but for the present the borders and floors should be damped liberally and the walls syringed frequently. A change to damp or wet weather will, as a matter of course, necessitate much drier treatment and the maintenance of a steady temperature, otherwise the berries of such varieties as Madresfield Court may crack; much, however, depends on the way the borders have been watered.

Muscats.—Muscat Grapes that are ripe or approaching that stage should be exposed to plenty of light by drawing the leaves a little aside, but not to such an extent that hot sun will reach and injure the shoulders. Keep the borders fairly moist and well covered with clean litter. Sun heat should now suffice, but in dull weather a little fire-heat will help to keep warm, fresh air in motion.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Crocus.—Autumn-flowering Crocuses should be planted so soon as possible. They are all suitable for planting in the rock garden, while some of them, such as *C. speciosus*, *C. zonatus*, *C. nudiflorus* and *C. pulchellus* are excellent for naturalising in grassy places. The choicer species and varieties of both autumn- and spring-flowering Crocuses should have the shelter of a cold frame, in which they can be planted in a well-drained bed, or be grown in pans and removed, when in flower, to a cool greenhouse. The large-flowered varieties of *Crocus vernus*, or the so-called Dutch Crocuses, are ideal for naturalising in grassy places, in the hardy fernery or for planting in beds of deciduous shrubs.

Budding Roses.—This work can usually be carried out over an extended period from June onwards, the period being largely determined by weather conditions, for in dry weather the bark of the stocks will not lift. In a small way this may be surmounted by watering the roots thoroughly and thus get the bark into a condition to run freely. A late and backward season may so affect the plants that buds cannot be obtained in suitable condition at the usual time; buds for the purpose may be obtained from shoots that have just finished flowering. In gardens where a quantity of plants are budded either for the upkeep of stock or for instructional purposes, the work should be performed as conditions permit, speed and clean workmanship being the essentials to success.

Cyclamen.—There are several species of hardy Cyclamen. The autumn-flowering species, of which *C. europaeum* and *C. neapolitanum* are the best, should be planted on a large scale in partially shaded places under trees, where they revel in a good natural deposit of decayed leaf-soil. The leaf-mould, combined with stony soil, seems to afford ideal conditions for them. They flower in wonderful profusion before their foliage is produced; the beautiful zoned and marbled leaves are also very beautiful in their season. Altogether Cyclamens are ideal subjects for naturalising. The autumn-flowering species should be planted so soon as possible. The spring-flowering species and varieties, as represented by *C. Coum*, *C. Atkinsii*, *C. ibericum* and *C. repandum*, should be planted so soon as the dry roots are received. They are all useful for planting in the rock garden,

or for growing in pans in the alpine or unheated greenhouse. *C. Coum* is excellent for naturalising in quantity under the same conditions as *C. neapolitanum* and *C. europaeum*, and under suitable conditions it seeds and increases freely.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Summer Pruning.—The summer pruning and training of wall trees should now be commenced. Pears growing on south and west walls should be attended to first, shortening all foreright shoots to the fourth leaf from the base, and tying or nailing in the leading shoots. Where the crops are heavy, opportunity should be

trained in to provide for future crops. Peach trees on south walls should have the same attention given them as when they are grown under glass, and no effort should be spared to keep them free from insect pests, as well as from the ruinous and disfiguring effects of Peach-leaf blister, by spraying and syringing them with well-known specifics.

Hedges and Topiary Work.—The clipping of trees and hedges is easily done now before the young wood has become firm, and although a few shoots or secondary growths may appear later, these may be easily removed at another time. *Escallonia macrantha* makes a perfect hedge-plant for western seaside districts, where it thrives and seems to revel in the salt-laden breezes. This shrub is best kept in shape by two prunings or clippings annually, when it

FIG. 25.—ROSE DAILY MAIL.

Awarded the Gold Medal of the National Rose Society and the *Daily Mail* Gold Cup, as the best new scented Rose, July 15; colour crimson. Shown by Messrs. W. E. B. Archer and Daughter, Sellindge, Ashford, Kent.

taken to thin the fruits to reasonable numbers. As trees growing on south and west walls are likely to suffer from lack of moisture, they should, if necessary, be well watered, and a mulch of manure or other moisture-retaining materials placed in position. Plum trees on walls should have as many of the current season's shoots tied in as room can be found for, always keeping in view the removal of older branches at the winter pruning, and only removing superfluous young shoots at this operation. Many old Plum trees have been ruined by spur-pruning, and a little thought and attention are required in the selection of the most suitably placed young shoots, so that the symmetry of the trees may be retained, while at the same time plenty of young, fruit-bearing wood is

forms a splendid shelter for less hardy or rather less salt-loving plants. In the milder districts golden Privet makes a very fine hedge, if planted in full sunshine and not overshadowed by stronger-growing subjects; occasionally a few of the shoots may revert to the green form, and these should be traced to their point of origin and severed. The common Fuchsia can hardly be surpassed as a flowering hedge plant for gardens in the west, but as it flowers from now onwards through the season, this is not the proper time to trim it, the operation being best performed in the early spring just before new growth has commenced. A Fuchsia hedge in autumn, with its myriads of scarlet and purple flowers, is a most beautiful sight.

NOTES FROM WISLEY.

THE chief object of interest at Wisley at present is the trial of Annual Poppies. Their growth has exceeded expectations, and their bright blooms make a fine display of colour. Among the most showy are the double-flowered varieties belonging to the *somniferum* group in which may be seen almost every shade of red and pink. Many excellent, double, white-flowered varieties are also in bloom, one of the best of which is White Swan. Contrast is provided by the very dark blooms of varieties such as Dark Heliotrope, Violet and Nubian Prince. A pretty, semi-double Opium Poppy is seen in Munstead Cream Pink while Bright Lilac is an attractive variety of the Paeony-flowered strain.

One of the best of the single-flowered Opium Poppies is The Bride, a tall-growing variety with large, white flowers. Miss Sherwood, with single, white flowers, edged with pale pink, is also very handsome, while those of the Admiral stand out by reason of the broad band of red which forms a margin to its white petals.

Among the many fine strains of the Shirley Poppy may be mentioned Shirley Mixed, Wisley Stock and Ryburgh Hybrids. The latter have already been in flower for more than six weeks and are still blooming. Stocks of Shirley Poppies in which pink predominates include those named Wild Rose and Deep Pink, while Little Gem, another pink-flowered Shirley variety is remarkable for the particularly compact habit of the plants. Other distinctive strains of the Shirley Poppy include Raynes Park Hybrids, of which the predominating colour is greyish-lavender, and American Legion, which has handsome scarlet blooms with white centres.

In addition to Shirley and Opium Poppies, Iceland Poppies, such as the Improved Sunbeam and the pink-tinged Coonara, are also in bloom, and although sown at the same time, they commenced to flower considerably earlier than any of the annual varieties. The only failure in this trial has been the Poppy species sent in from Botanic Gardens, for not only has germination been poor, but in many cases an extremely mixed crop has resulted.

Next to the Poppy trial is a trial of Sweet Sultans which will shortly be in flower. The plants of this rather uncertain subject have made excellent growth, and should look extremely well blooming in such variety and large numbers.

Other plants on trial in this part of the gardens include Zinnias, herbaceous Phloxes and Kniphofias (Tritomas). The last, however, were only planted last autumn and will not be at their best for at least another year. In spite of this, some good blooms are to be seen on orange-flowered varieties, such as Vera D. Pritchard, Glowing Torch and Excellence, and on Russell's Gold, which has yellow flowers.

Bearded Irises selected by the Garden Committee are now being divided and replanted under a new system whereby separate beds for each colour are provided, and room is being left for any additional varieties which may be sent in at a later date.

Some of the Delphiniums have now passed their best, but there is still a good show of bloom in this trial. Varieties which have done well include the brilliant blue Constance, Violet Queen, Corry, Orion and F. W. Smith; the last-named has grown very tall.

A feature of the herbaceous borders this year is the large number of *Salvia* species, most of which are now in bloom. One of the most striking is *Salvia argentea*, which has very large leaves thickly covered with silvery down. This feature is also found on the leaves of *S. globosa*, so called on account of the globular arrangement of the inflorescence. *Salvia turkestanica* and *S. virgata nemorosa* are most useful in the herbaceous border, not only for their flowers, but also by reason of their brightly-coloured bracts, which persist long after the flowers are over. Other good *Salvias* in flower are *S. transylvanica*, with purplish-blue flowers, and *S. nutans*, with blooms suggestive of spikes of Lavender. Blue and mauve plants

seem to predominate in the borders at the present time, for in addition to *Salvias*, flowers of similar colouring are seen in *Erigeron speciosus*, *Erigeron Elsie*, and in *Campanulas* such as *C. bononiensis*, *C. grandis*, *C. lactiflora* and *C. latifolia*, of which Brantwood is a good variety. Two blue-flowered members of the Borage family in bloom are *Mertensia sibirica*, with pale blue flowers and glabrous foliage and *Symphytum peregrinum*, which is too coarse-growing for any but a large border, while a blue-flowered Composite is *Catananche coerulea* with papery bracts. A variety of the latter-named bicolor, with white flowers having a violet centre, is also in bloom. Thistle-like plants include *Acanthus spinosus*, which is flowering in company with *Morina longifolia*. The latter has whorls of tubular blossoms which are first white and later turn pink and red.

Other noteworthy plants in flower in the herbaceous borders are *Heliopsis scabra*, a compact-growing Composite with yellow flowers, and *Sidalcea Listeri*, with pale pink flowers. Among the many plants which are worth growing for their foliage alone may be mentioned *Selinum tenuifolium*, *Thalictrum dipterocarpum* and *Artemisia borealis*, with grey leaves.

The ponds are now gay with Water Lilies, but their effect is partly spoiled by the condition of the foliage, most of which is badly riddled by insects and other pests. The chief offenders in this respect are the larvae of the Brown China Mark Moth (*Hydrocampa nymphaeata*), the larvae and adults of a water beetle (*Galeruca nymphaeae*), and the grubs of the Caddis Fly. Damage has also been done by an aphid (*Rhopalosiphum nymphaeae*) which attacks in addition other aquatics. The introduction of fish helps to keep down these pests, but unless the foliage is forcibly submerged, the fish cannot get at insects on the upper surface of the leaves.

The Roses have benefited greatly from the heavy dressings of manure, which have been applied to them, and are blooming very well both by the main entrance and in the new trial beds near Wisley village. Varieties which are flowering particularly well include Salmon Spray, Isobel, Pink Delight and Madame E. Herriot.

In the rock garden many species of *Cistus* are still in bloom, but the majority of *Helianthemums* are now over. An exception is *H. Tuberaria*, which has yellow flowers and large leaves that are a distinct feature of this plant.

A large group of *Primula Littoniana* is now in bloom, and another bright patch is formed by the flowers of *Erythraea diffusa*, a dwarf, pink-flowered alpine. The pink flowers of the British wild Centaury, *Erythraea Centaureum*, may also be found in the rock garden. In the alpine house an unnamed, dwarf, lilac-flowered *Rhododendron* is unexpectedly flowering, and a number of *Campanulas*, including *C. Hendersonii* and *C. Stansfieldii* are in bloom, while in the alpine frames is an attractive looking pan of *Campanula attica*.

A new building is in course of erection, not far from the Garden Keeper's house. It is to be faced with Elm boarding and will have a roof of old tiles. This will be used as a bulb store, and includes a room in which fruit will be exhibited. J. E. Grant White.

HARDY FLOWER BORDER.

HEMEROCALLIS.

THE Day Lilies, members of the genus *Hemerocallis*, are easily-grown, summer-flowering plants, admirably suited to the herbaceous border or for forming masses in the wild garden or woodland. Being moisture-loving plants, they are also suitable for planting near streams. Although the individual flowers remain in beauty only a short time, many of the plants produce quantities of flowers which succeed each other rapidly and thus ensure a display of colour over a considerable period.

The predominant colour is yellow, which varies in depth of shade from the clear, canary-yellow of *H. flava* to the deep golden, almost

coppery-red flowers of *H. fulva*. Both these species are natives of Southern Europe and with their varieties are the most useful for all purposes. *H. flava* is the more graceful plant, producing ample leaves with numerous flower-spikes thrown well above the foliage, each spike bearing about a dozen bright, canary-yellow flowers of delightful fragrance. Its variety major is also an excellent plant. *H. fulva* is a somewhat stronger growing plant, and one of the best for the woodland garden, where its rambling habit is less liable to encroach than in the border. It is also very suitable for planting on the banks of a small stream where water is within reach of the roots.

H. Middendorffii, an Asiatic species, is a good plant of neat habit, and one of the earliest to flower. It is of compact growth and produces freely its deep, orange-coloured flowers. *H. Dumortieri* is a plant of dwarfer habit, bearing soft yellow flowers with reddish-brown reverse. It flowers freely and is worthy of a position in the front of the border.

There are numerous hybrids of comparatively recent introduction which add considerably to the decorative value of the genus. Notable amongst these are Apricot, with richly-coloured, apricot-orange flowers, sweetly scented; Orange Glow, with rich orange, broad-petalled flowers produced very freely; and Sovereign, with soft yellow flowers which are coloured a rich brown on the outside. A. P. C.

PRUNELLA WEBBIANA.

SOMETIMES known as *Brunella Webbiana*, which name is considered correct by many authorities, this low-growing, herbaceous plant is suitable for growing in the foreground of the herbaceous border. Free in growth, it spreads rapidly by means of decumbent stems rooting from the nodes, the stems afterwards becoming erect to bear large, terminal heads of rich purple flowers. These large, hooded flowers, with lips of a lighter shade and red-brown calyces, are borne in closely-packed whorls, and situated at the base of each whorl are two broad, hairy and red margined bracts, the combination of reddish-brown and purple producing a very striking effect.

The leaves at the base of the stems are very long-petioled, while those directly beneath the flower heads are sessile, in fact, stem-clasping. They are sometimes as much as four inches long and deeply lobed, the lobes being large and irregular, while both surfaces are hairy and of a light green colour.

The plant is perfectly hardy, suffering no ill-effects during the winter and thriving in any ordinary garden soil that is not excessively heavy in texture. A. G. F.

CAMPANULA PHYCTIDOCALYX.

THIS delightful *Campanula* is also known under the name of *C. amabilis*, but for some reason it does not appear in catalogues unless it is under another name. We have grown it as *C. phytidocalyx* for several years, and although it is quite hardy, it cannot be considered a satisfactory species if left to itself for two or three years.

It is not unlike some forms of *C. persicifolia*, and attains a height of eighteen inches or two feet. It is most effective when provided with a few twiggy supports to keep the spikes in an upright position. It is a handsome species, a native of South Armenia; the large flowers are a purplish-blue with a paler eye, while the leaves are spoon-shaped and pleasingly crimped.

This plant apparently requires to be divided and replanted frequently or given a top-dressing of soil soon after the flowering period. We divide the plant annually, about September or October, and each year the flower spikes are freely produced, while occasionally a few seedlings appear around the old plants, these flowering in their second year.

Although large numbers of other *Campanulas* are in cultivation this species should certainly be given a trial, for it is one of the best during June, either for the border, or on a large rock garden. T. W. B.

INDOOR PLANTS.

BILLBERGIA NUTANS.

A few pot plants of this Bromeliad form a pretty feature in the warm house during February and March. The long, sword-shaped leaves are arranged in vaseform manner and furnished with spines along the margins. The flowers are borne in short, loose, drooping racemes. The sepals are pale red and the petals green, tipped with blue. It is the large rosy red bracts, however, which form the most conspicuous feature of the inflorescence, and give to the plant its decorative appearance.

Billbergia nutans grows well in sandy peat mixed with a small quantity of good, fibrous loam. It requires a position in a warm house in full sun, and should be kept moderately moist during the winter, but the supply of moisture at the roots should be fairly liberal during the summer; at this season also the plants should be syringed two or three times daily. Growths which have flowered should be cut away. Propagation is easily effected by means of the numerous suckers produced. *T. H. Everett.*

WINTER-FLOWERING BEGONIAS.

YOUNG plants of *Begonia Gloire de Lorraine* should be transferred to larger pots. These Begonias are generally grown in several batches, and while some will be ready for placing in six-inch pots, others should be grown on from their cutting stage in small receptacles.

The compost for the larger plants may consist of equal parts turfy loam and leaf-mould mixed with dried cow manure, and a liberal dash of silver sand added to render the soil porous.

In potting these Begonias it is not advisable to use a rammer; sufficient firmness of the soil may be obtained by pressing the compost with the fingers. The plants dislike lime in any form, and where the service water is found to contain lime in any quantity they should be watered with rain water.

If a late batch of these Begonias is required, cuttings may still be inserted in small pots filled with a light, open mixture. So soon as the plants that constitute the early batch have formed plenty of roots, give the latter a mild stimulant in the form of weak soot-water; this will tend to make the foliage dark green.

Begonias of the Optima type will also need repotting as they become ready. Similar compost as that for the *Gloire de Lorraine* type may be used. Fumigate the plants at intervals to keep aphids and mites in check, as these Begonias are very susceptible to attack by these pests. *T. P.*

JACOBINIA CHRYSOSTEPHANA.

THE Natural Order Acanthaceae includes many of the most decorative of our warm-house winter-flowering plants, and amongst them *Jacobinia chrysostephana*, a native of Mexico.

The narrow, tubular, orange-coloured flowers are produced in dense corymbs and a well-grown batch of plants forms a bright and striking feature on the stages of the stove or intermediate house. The foliage is handsome and deep, rich green in colour.

Propagation is easily effected by means of cuttings inserted in the spring. These if placed singly in small pots, or three or four around the sides of a sixty-sized pot, and plunged in a warm propagating pit, soon develop roots. The plants may then be potted on, a suitable compost consisting of two parts loam, one part leaf-mould, and one part peat with sufficient sand to render the soil open and porous.

Every attention should be given to the plants to form stout growths as they furnish the finest flower heads, and the growing points should not be pinched.

If single-stemmed plants are objected to, three plants may be grown together and potted on in six-inch or seven-inch pots, or good specimens one-and-a-half feet to two feet high may be grown in forty-eight-sized pots.

This *Jacobinia* needs a stove temperature at all seasons. Forcible syringings with clear water are necessary to keep red spider in check.

When the plants are established in their final pots, diluted soot-water and manure water, applied two or three times weekly, are helpful to growth.

This plant is figured in *Bot. Mag.*, tab. 5,887, under the name of *Cyrtanthera chrysostephana*. *H. T.*

ORCHID NOTES AND GLEANINGS.

DISA ITALIA PINK DOMINO.

ON the occasion of the Amateur Show, held by the Royal Horticultural Society, on June 28, the first prize for a new garden plant was awarded to Col. Stephenson R. Clarke (gr. Mr. S. R. Conn), Borde Hill, Sussex, for *Disa Italia Pink Domino*, a particularly beautiful Orchid with deep pink dorsal sepal and bright rose-pink petals. There were several spikes of flowers, suggesting a robust constitution and a free-flowering habit. At the R.H.S.

FIG. 26—DISA ITALIA PINK DOMINO.

meeting on Tuesday last the plant was given an Award of Merit. The parentage of this fine hybrid is *Disa Blackii* × *D. grandiflora*.

CYPRIPEDIUM ROTHSCILDIANUM.

THIS *Cypripedium*, named after the late Baron Ferdinand de Rothschild, of Waddesdon Manor, near Aylesbury, was introduced in 1887, and first flowered the following year.

It was described in *Gard. Chron.*, III., s. 3. (1887), p. 457, when Messrs. Sanders, of St. Albans, are credited with its introduction to cultivation; but this was disputed by the Director of L'Horticulture Internationale, Parc Leopold, Brussels, who stated that it was Mr. J. Linden who first introduced it from New Guinea; this again has been contradicted, and the species was said to have come from Borneo.

From a horticultural standpoint, these differences are not of much interest now, but *C. Rothschildianum*, and its progeny, at the present time comprise a family of remarkable plants, which produce their flowers at this season of the year, and maintain the interest of a most popular family of Orchids. *C. Rothschildianum* received a First-Class Certificate from the

R.H.S. so far back as March 12, 1889, and several varieties of superior merit have been shown from time to time under varietal names.

C. Rothschildianum is a robust grower, a quality it imparts to the major part of its progeny, the whole of which produce tall spikes of handsome flowers, and even when not in bloom their long, green leaves are decorative. All require the temperature of the warmest house, and liberal treatment at all times.

Some fifty hybrids are recorded, in which most of the popular species have taken part, whilst a proportion of hybrids are also parents. As each variety passes out of bloom it should be attended to as regards potting; all that require new material should have attention, those that will thrive for another season passed over, thoroughly cleaned and placed in their growing quarters. Ordinary flower pots are the best receptacles for these strong-growing plants, but in no case must they be over-potted. The ordinary *Cypripedium* compost of peat and A.I. fibre will answer their requirements, but

too much loam fibre must not be added, as the majority make strong roots in proportion to the strength of the plant.

After repotting, water may be given to settle the compost around the roots, but care must be used in the application of water afterwards, as the best compost, also the roots of the plant, are easily ruined at this stage by a superabundance of water.

When established, copious supplies of moisture should be given whenever the roots become dry, and especially when the plants are in active growth.

Light overhead sprayings of soft, tepid water, on bright days are beneficial and aid in keeping the plants clean and healthy. *Cypripediums* thrive in plenty of atmospheric moisture, and are very rarely attacked by thrips and other insect pests, where it is supplied.

Amongst the best of the hybrids derived from *C. Rothschildianum* are *C. Rolfei*, *C. Edith*, *C. callo-Rothschildianum*, *C. Transvaal*, *C. A. de Lairese*, *C. Daisy Barclay*, *C. Jupiter*, *C. Shilliamum*, *C. Shakespeare*, *C. Neptune*, *C. Wiertzianum*, *C. l'Ansonii*, *C. St. Swithin*, *C. Prince Edward of York*, *C. W. R. Lee* and *C. Pelican*. *J. T. Barker.*

SOME NOTABLE ROCK ROSES.

Few who know it will be other than willing to grant *Cistus wintoniensis* a foremost place among the most beautiful and distinctive of its race. Indeed, I consider it the most striking addition made to this fascinating genus for many years. With me, *C. wintoniensis* promises to be rather a low-growing shrub of somewhat prostrate habit. The branches are slender and the broad, well-rounded leaves are a pale sage-green tending to grey. The pure-white, cupped or bowl-shaped flowers have broadly overlapping petals, each with a wide, daintily feathered band of crimson-maroon near the base; they are fully two inches across. Unlike the colour blotch in all other white Rock Roses the band of colour forms an unbroken ring, within which there is a zone of bright yellow. A wreath of orange stamens encircles the white stigma. This very charming shrub was raised by Messrs. Hillier a few years ago. It is believed to be a hybrid between *Cistus* and *Helianthemum*, which gives it an additional interest. It received the R.H.S. Award of Merit in April of last year.

C. recognitus is another variety of outstanding merit. I refer to the shrub which appears to be in general cultivation by the trade under that name, and not to the *C. laurifolius* × *C. monspeliensis* hybrid alluded to as *C. recognitus* by Mr. W. J. Bean in *Trees and Shrubs Hardy in the British Isles*. The latter, one presumes, has unspotted flowers, whereas those of the former are faintly flecked on each petal with a pencilling of vivid carmine. The blooms are rather more than three inches across; they open flatly and are produced in such prodigious numbers that while the shrub may be sheeted with blossom the ground beneath is covered with a mat of fallen petals. *C. recognitus* grows some four feet or five feet high here, thus being rather taller than *C. Loretii*, to which it bears some resemblance. Its fresh green leaves are narrower than those of the last-named hybrid, and they emit, especially in spring, a delicious fragrance suggesting that of the Lemon-scented *Verbena*. I do not know of any other *Cistus* which has this particular and delightful fragrance.

C. ladaniferus var. *immaculatus* is a singularly beautiful member of this genus and one that will always hold its own in any collection. It is very similar to the type, the chief point of difference being in the flowers, these being pure white with no trace of a colour-blotch. They are larger than those of *C. ladaniferus*, sometimes measuring so much as five inches across. The foliage is a paler, more grassy-green, and the young wood often has a distinctly golden hue.

Of *Cistuses*, other than white, *C. purpureus* must still be accorded first place, though the very beautiful and distinctive *C. Silver Pink* is no less attractive in its own way. But there are, unfortunately, a good many forms of *C. purpureus* in gardens and nurseries which are not nearly so pleasing in colour, if as large in blossom, as an older type now not so often seen. In this latter the flowers have less of the rather hard, bluish-purple of *C. villosus* in their colouring, and a more decided infusion of a warm red. *A. T. J.*

FLOWER GARDEN.

DELPHINIUMS.

DELPHINIUMS are now at their best, and few border flowers are more majestic and beautiful. In a collection growing under typical garden conditions, the following varieties appeal to me as being of special merit. Amongst the singles Lord Lansdowne is remarkably fine. The individual blooms, which open well, are of very large size and a rich blue, even for a Delphinium.

Colonel Wyndham Murray is a valuable bi-coloured single, being notable for the length of the individual spike. The flowers are blue with white centres, giving a very charming effect.

Blue Boy is the most vigorous Delphinium in my collection. The plants are well over six feet in height, and they are flowering in a very generous manner. The colour is dark blue. In Capri, the spikes branch freely and the effect is pleasing. The colour of the flowers is like that of the sky on a perfect summer day—so delicate a blue that it must appeal to all. In my garden the plants attain little more than three feet in height.

King of Delphiniums is a very appropriate name for the variety which bears it, for the double flowers are truly regal in appearance. There is a well-marked white centre in the flowers, surrounded by petals which assume the colour of a blue Gentian flower.

Amos Perry is a shade of mauve-blue, and is one of the most beautiful of Delphiniums. The habit of the plants leaves nothing to be desired.

My herbaceous border is situated in front of a wall of weathered mountain limestone, and the contrast between the wall and deep blue, double flowers of the variety Francis Fox is very charming. The variety would look charming anywhere, and it should be included in all collections.

The colour of the flowers of Mrs. Shirley are difficult to describe, for the pigments are so elusive. The centre is white with a suspicion of mauve in it, while the outer part is a mixture of lilac and mauve. The plants grow six feet tall and they flower with great profusion.

Andrew Carnegie is one of the most vigorously growing varieties. The plants have very thick stems and bold leaves. The spikes are of great length and the soft blue flowers of enormous size. It is a variety which may be highly recommended. *Geo. H. Copley, N.D.H.*

LINUM ARBOREUM.

In a family of mainly blue-flowered plants, *Linum arborescens* is a distinct species, with pale yellow flowers borne in a constant succession from May to August.

Unlike *L. perenne*, this forms a six- or nine-inch bush of stout stems, clothed nearly to the base with grey-green, spoon-shaped leaves.

The shoots grow rapidly in early spring, and on sunny days the plants are gay with their numerous flowers.

It is an excellent plant for a sunny position on a rockery or dry wall and may be planted singly or in clumps. An effective and unusual use would be as an edging to a pathway or border. *L. Le C. T.*

SALVIA FULGENS.

THE Cardinal Sage, as this attractive species is termed, is a useful plant for late summer effect. It is a vigorous grower, woody at the base and producing strong, slightly downy growths to a height of from two feet to three feet. These are clothed with bright green, long petioled leaves which are cordate in shape and sharply pointed, the margins being serrated, while both surfaces, especially the under one, are clothed with soft down.

The flowers are very conspicuous, the corollas being of a rich, deep scarlet; they are about two inches in length, and protrude from downy, dark-red-tinted calyces. Flowering commences about the middle of July and continues until checked by frost, the flowers being produced in whorled racemes up to twelve inches in length.

This *Salvia* is best treated as a bedding plant as it seldom survives the winter. Cuttings of it root readily and if wintered in a frost-proof place, will make strong flowering plants if put out during the latter part of May. *A. G. F.*

SALVIA FARINACEA.

THIS very pretty perennial is not fully hardy in this country, except in well favoured localities, and is in consequence usually treated as a half-hardy annual. It succeeds quite well when treated in this way, and produces its flowers freely during the late summer.

Those plants which were put out in 1926 have withstood the rather mild weather of the past winter, and are making fine, bushy specimens. The seeds should be sown in heat at the end of February, and when the seedlings are sufficiently large to handle, they may be pricked

off into boxes at two inches apart. They should be grown on in a warm greenhouse or pit until such time as the weather is favourable for their removal to cold frames.

After gradually hardening them off, the young plants may be put out in their flowering quarters after the middle of May. A better effect is produced by massing than can be obtained by planting in rows.

Salvia farinacea attains a height of about two feet but its somewhat upright habit necessitates rather closer planting than is usual for plants of this height. *Charles Hodgson, Acton Place Gardens, Sudbury, Suffolk.*

SENECIO ABROTANIFOLIUS.

This plant, when in bloom, is from nine inches to twelve inches high. The colour of the flowers is brilliant orange, each bloom being about one and-a-half inch across, but owing to the somewhat loose arrangement of the petals and the open way in which six or seven blossoms are set at the end of the stem, the whole effect is most pleasing, light and graceful.

The deep green, Ferny foliage is also an additional charm. Although the plant is a good grower, it is by no means coarse, and when in bloom it ranks among the best of flowering plants, especially if associated with one of the pale blue Campanulas. It requires a well-drained soil, and a light, rich, rooting medium, such as loam, peat and leaf-mould, with a liberal addition of sand. *Senecio abrotanifolius* will thrive in the ordinary flower border, provided the soil is not on the heavy side. *T. W. B.*

TREES AND SHRUBS.

RHODODENDRON YEDOENSE.

(SEE SUPPLEMENT PLATE.)

THE handsome, double-flowered *Rhododendron yedoense* has already attained considerable popularity in this country, especially among lovers of *Rhododendrons* and *Azaleas*. Although it bears the generic title of *Rhododendron*, this species will be regarded as an *Azalea* by most gardeners because of its habit and leafage.

Mr. E. H. Wilson states* that "This double-flowered *Azalea*, in recent years exported from Japan in some quantity to the gardens of Europe and America, is certainly nothing but a monstrous form of *R. yedoense* var. *pukhanense*, Nakai. My Korean specimens came from a plant which had been found wild not far from Mount Poukhan, and transplanted to the Government Forestry Experimental Garden, and are indistinguishable from others taken from plants cultivated in the Arnold Arboretum. The habit is spreading and more lax than in the type except when the latter grows among tall bushes. The flowers are quite double, and the corolla is rose-purple and much less beautiful than that of the type; the calyx is green, often larger than in the type, with oval segments. The leaves are characteristic and have the impressed veins on the upper surface. This form seems to have become known in our gardens comparatively recently, and to have been first introduced into Petrograd by Japanese and exhibited at the International Exhibition there in 1884. It is perfectly hardy in the Arboretum. Matsumura gives 'Botantsutsuji' (*Paeony Azalea*) as the vernacular name of this plant."

R. yedoense is perfectly hardy and free-flowering, producing its rosy-purple, double flowers in great profusion on somewhat lax branches which suggest that some amount of pruning will be necessary to keep a specimen shapely. Many cultivators exhibited *R. yedoense* at the *Rhododendron Show* this year, but the finest sprays of blooms were those shown by Lady Aberconway and the Hon. H. D. McLaren (gr. Mr. Puddle), from Bodnant, and it was from a photograph of these flowers that our Plate was prepared.

The authors referred to above consider that the wild type of *R. yedoense* is really *R. y. var. pukhanense*, which is found in many parts of

* *A Monograph of Azaleas*, by Ernest Henry Wilson and Alfred Rehder.

Korea; they suggest that the type is usually a compact, densely-branched shrub from a few inches to a metre in height; they also refer to the fine orange and crimson tints of the more or less deciduous foliage in the autumn, and state that the flowers are in clusters of two or several, rose to rose-purple, remarkably fragrant, with an ample green calyx.

NUTTALLIA CERASIFORMIS.

NUTTALLIA cerasiformis—the Oso Berry—sometimes known as *Osmaronia cerasiformis*, is an upright, deciduous shrub, from six to ten feet high, and often more through. It has large, bright green, oblong leaves, which are acute at both ends, glabrous above, pubescent beneath. It is generally grown for its small,

it produces its attractive fruits quite freely most years, where the staminate and pistillate plants are growing within a few feet of each other, and, needless to say, this, of course, is necessary.

Nuttallia cerasiformis is readily propagated from suckers, which are freely produced, or from seeds. The fruits are strongly Almond-scented and very bitter, but are readily devoured by birds when ripe. *F. G. Preston, Botanic Garden, Cambridge.*

STYRAX WILSONII.

THIS very attractive shrub has flowered exceptionally well this season, a specimen some six feet in height being full of blossom from base to tip throughout June and part of July.

where, but it is, nevertheless, grown very successfully with the shelter of a wall in many somewhat bleak counties. It is a lime-lover and delights in a calcareous loam, but it will succeed in any average, well-drained soil in exposure to full sun, provided it is protected from cutting winds and draughts.

C. californica is an evergreen and allied to *Philadelphus*. It will attain to a height of seven feet or even more, but is most frequently seen as a bushy shrub of about half that stature, with a tendency to a leaning or trailing habit, which renders it a useful subject for the bolder parts of the rock garden. This fine shrub is easily raised from seeds or cuttings struck in a cold frame in August. It belongs to the Natural Order Saxifragaceae. *A. T. J.*

FIG. 27.—FRUITING BRANCHES OF *NUTTALLIA CERASIFORMIS*.

R.H.S. Award of Merit, July 5. Shown by the Director, Cambridge Botanic Garden. (see p. 38.)

white, sweet-almond-scented blossoms, which are borne in pendulous racemes from the leafless shoots in March. It is a dioecious species; the flowers of the male plant are the more attractive, being larger than the flowers of the female plant, but the latter is well worth growing in the vicinity of the male plant for the sake of its abundance of oval-shaped fruits, which are, ornamental drupes, one-quarter to one-third of an-inch long, somewhat resembling small Damsons in appearance. These are green at first, turning to yellow, then to reddish-purple, and finally to bluish-black when ripe, and both when the fruits are at different stages of ripening or when all have reached the ripe stage, the fruiting plant is very ornamental (Fig. 27).

N. cerasiformis is closely allied to *Prunus*, differing in its five-carpelled flowers, and although occasionally one finds all five carpels developed usually only two or three do so.

The *Nuttallia*, or Oso Berry—to give its common name, was introduced into this country in 1849 from North California, where it is a native, growing on the margins of Pine woods. It is perfectly hardy and will thrive in any loamy, well drained soil.

Here, in the Botanic Garden, Cambridge,

The nodding, widely-cleft, bell-shaped flowers, each about three-quarters-of-an-inch across, are borne singly at the leaf axils, their delicately-cut corollas being in happy harmony with the slender branches and thin, elegant habit of the shrub.

S. Wilsonii was introduced by Mr. E. H. Wilson in 1908. It is a deciduous shrub, and here it does very well in a border in light loam. The ends of the shoots are sometimes nipped by frost, but beyond that it has never suffered injury in winter. Plants raised from cuttings, will often flower in their first year, that is, when only a few inches tall. *A. T. Johnson, Ro Wen, Conway, North Wales.*

CARPENTERIA CALIFORNICA.

A NATIVE of California, this splendid shrub was discovered by Colonel Fremont about the middle of the last century; it was first flowered in this country in Miss Jekyll's garden in 1885.

Not only is *C. californica* a remarkably beautiful shrub, with its clusters of large, white blossoms, which bear a superficial resemblance to those of *Anemone japonica*, but its flowers are fragrant, and they appear from early July onwards, just when many other shrubs are going off. The plant is not hardy every-

HEDYSARUM MULTIJUGUM.

EARLY in July a fine specimen of this beautiful and unusual shrub was making a brilliant display in the interesting garden of D. Shoolbred, Esq., Chepstow, Monmouthshire. For some reason it is rarely seen in gardens, but it is of value on account of its late flowering, as its blooms develop from June till September.

The plant is a native of Mongolia, where it is found wild in dry areas, a fact which proves that it would be useful for planting on dry banks, and more especially in sunny positions, where the soil is light and well-drained.

H. multijugum belongs to the National Order Leguminosae, and the reddish or rosy-magenta flowers are Pea-shaped and produced in racemes. It is of bushy habit, grows three feet to four feet high, and is very effective in a group or as an isolated specimen in close proximity to the rock garden. In some situations it grows somewhat straggly in habit, but this may be obviated by pegging down the growths. Layering is also a very good method of increasing the stock; it may also be raised from cuttings inserted during July and August in a cold frame *B.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

BRITISH GUIANA.

BRITISH Guiana is situated on the North-east shoulder of the South American mainland and has an area of 89,480 square miles. Although so near the Equator its climate is not unbearably hot at any season, particularly in the coastal area where fresh sea breezes blow steadily, with little intermission, so that life generally is not intolerable for Europeans, and during the first months of the year it is distinctly pleasant.

The colony may be divided roughly into three belts, a flat, swampy strip of marine alluvium, varying from ten to forty miles in depth, which rises gradually from the coast; a somewhat broader and elevated tract of country consisting chiefly of undulating land traversed in places by sand-dunes rising from fifty to two hundred feet above sea-level; and the more elevated portion lying towards the south, which contains the three principal mountain ranges. Much of this land is forest-clad, but on the southern side there is a grass-clad, elevated plain or savannah, about 500 to 700 feet above sea-level.

Georgetown, the capital and seat of Government, with a mixed population of nearly 60,000, is the chief port of entry for the colony, and is situated at the mouth of the Demerara river, on its right bank.

The flat plain which forms the coast land is unattractive, and is to a considerable extent below the level of high tides which flood the unprotected parts. Its margin is covered with dense growth of the Mangrove (*Rhizophora*) and Courida (*Avicennia nitida*), the matted roots of which make an effective natural sea wall. Behind this growth are flat, grassy savannahs, mostly inundated during the rainy season.

The city itself has all modern conveniences, fine shops, handsome public buildings and attractive private residences, surrounded by a wealth of flowering plants and luxuriant vegetation. Many of the streets consist of two ways for vehicular traffic, with a central avenue, between grass borders, shaded by ornamental trees, for the use of pedestrians.

The flora of British Guiana is full of interest, and although each region possesses its distinct plant associations, the transition from one region to another is, for the most part, gradual. The vegetation on the sea-shore fringe consists largely, as already stated, of Courida, the lateral roots of which grow upwards into the air from

the swampy soil in order to provide the necessary air for those roots growing in the mud. At low tide these matted roots appear as giant, dull brown, reed-like masses, and they are well-adapted to resist the force of the sea and prevent the muddy shore from being washed away. Mangroves sometimes appear on the seashore, but become much more abundant in the muddy swamps at the mouths of the rivers. The Black Mangrove (*Rhizophora Mangle*) is the more common, but the White Mangrove (*Laguncularia racemosa*) is prevalent. The Mangrove sends out large numbers of aerial roots which extend, stilt-like, downwards, and act as props, so that the general appearance of a Mangrove "bush" is a confused jungle of roots between the branches and the swamp below. In some places along the seashore and up the rivers the dark green Courida and Mangrove bush is interrupted by a lower-growing bush of lighter hue. This is the impenetrable Bunduri (*Drepanocarpus lunatus*),

FIG 28.—YELLOW-FLOWERED VARIETY OF MECONOPSIS SIMPLICIFOLIA.

(see p. 71.)

the prickly branches of which float with the rise and fall of the water. Small tracts of open, swampy land also occur, which are covered with the giant Swamp Fern (*Acrostichum aureum*), which is also found in abundance in the front pasture lands of the sugar estates, together with the Bull-rush (*Typha domingensis*) and the Bizzy-bizzy (*Cyperus articulatus*). In the trenches by the sides of the public roads and on the sugar estates are to be seen the handsome white Water-Lily (*Nymphaea amazonica*), the beautiful Water Hyacinth (*Eichornia coerulea* and *E. azurea*), the interesting Water Lettuce (*Pistia Stratiotes*) and the Sacred Lotus (*Nelumbium speciosum*).

Higher up the river the vegetation becomes more mixed, and the number of species larger. Very conspicuous is the giant Aroid, Mukka-mukka (*Montrichardia aculeatum*), which is common to most of the rivers. This has shiny, arrow-shaped leaves and Arum-like flowers, and often grows to a height of fifteen or twenty feet. The Konaheri and the Konaheriballi (*Pachira aquatica* and *P. insignis*), the former with yellow, and the latter with dark red, tassel-like flowers, attract attention, their conspicuous, brown fruits resembling Cacao pods. Other prevalent plants are the Trysil (*Pentaclethra filamentosa*), the Dalli or Wild Nutmeg (*Myristica surinamensis*), the beautiful Wakenam Lilac (*Jacaranda ovalifolia*), and the Manni (*Moronobea coccinea*), easily recognised by the deep crimson of its flowers. The trees

along the river banks are draped with climbing plants, including Bignonias, Bougainvilleas, and *Odontodenia speciosa*, with pretty, yellow flowers.

Where clearances have been made in the original forest and secondary growth has taken possession, Pampwood (*Cecropia peltata*) and Long John (*Triplaris surinamensis*) are common. Large specimens of Mora (*Dimorphandra Mora*) occur along the flat, clay banks of the rivers, and their massive trunks and strikingly beautiful foliage make them objects of great attraction. Further away from the rivers larger trees are noticeable, and one of the most conspicuous is the Silk Cotton (*Eriodendron anfractuosum*). This has a huge spread of branches, and when the fruit buds burst, the whole of the surrounding vegetation becomes covered with soft, silky down, by means of which the seeds are dispersed by winds.

Throughout the whole of the alluvial region Palms are plentiful and arrest attention by reason of their graceful beauty and variety. The beautiful Manicole (*Euterpe edule*) is widely distributed, and in places becomes almost a forest tree, while *E. stenophylla*, a more slender-growing but similar plant, is often found in companionship with it. The Iti (*Mauritia flexuosa*) is found in great abundance growing on low ground that is flooded in the rainy season. It is easily recognised by its column-like stems, surmounted by a crown of large, dark green, fan-shaped leaves. The young, unfolded leaves of this Palm provide the Indians with Tibisiri fibre for their hammocks. The Kokerite (*Maximiliana regia*) is probably the grandest of all British Guiana Palms. It occurs practically all over the colony except on the immediate coast land, and is a striking plant at all stages of its growth. The Truli (*Manicaria saccifera*) and the Dahlibami (*Geonoma baculifera*) are both common, and their leaves are used for thatching purposes, while the Avarra (*Astrocaryum tucumoides*), the Paripi (*Guilielma speciosa*) and the Kamawarri, a trailing Palm, are worthy of notice.

Very few Orchids appear in the lower reaches of the river, but they become abundant and conspicuous higher up. Several species of *Catasetum* and *Epidendrum* are common, the red-flowered *Rodriguezia secunda* appears on the eastern side, while the charming *Ionopsis paniculata*, the delicate white and mauve flowers of which remain in beauty a long time, and the pretty *Oncidium iridifolium* are found in the north-west. *Vanilla planifolia* is also common in some parts and covers the trunks of trees but does not appear to set its fruits freely by natural means. Among epiphytes the Bromeliads are frequent, and in some places large colonies of *Bromelia spicata* and *Tillandsia usneoides* are met.

The vegetation along the banks of the creeks which drain the wet savannahs becomes thinner and dwarfer as the swampy region is approached. The Monkey Apple (*Anona palustris*) and the White Cedar (*Tabebuia longipes*) are commonly seen, while towards the heads of the creeks species of *Crinum* in flower are met here and there as also are the sub-aquatic Orchid (*Habenaria longicauda*), and species of *Limnanthus*. Sometimes an inland lake opens out to view and handsome Water Lilies present an attractive picture. In the early morning the large, snow-white flowers of these Lilies may be seen to perfection on the smooth, dark-coloured water, and between the large, flat, floating leaves appear the pretty yellow and blue-flowered *Utricularias* and the graceful, floating shield of *Cabomba aquatica*.

Between the rivers are often to be found slightly elevated, sandy, intermediate, savannahlands, covered with grasses and scrub, forming more or less flattened water-sheds. Here grasses and sedges are the predominant vegetation, but many Melastomaceous plants and several *Solanums* are to be found. *Clusias* are common and *Curatella americana* is ubiquitous, while epiphytes are much more common than along the river banks.

The flora of the interior of the colony, in which are numerous hills and mountains, has many distinctive features and varies according to the nature of the soil. A general scarcity of Palms

is here noticeable, although species of *Bactris* and *Astrocaryum* do occur in places, being represented by fine clumps. Along the Potaro, examples of *Wallaba* (*Lepurua falcata*) are to be seen, their pendant, flat fruits reaching almost to the water, while on the banks of the Barima the scarlet heads of *Brownea coccinea* or *Rosa del Monta*, and the blue spikes of *Petrea vulubilis* attract attention. In the forest itself it is frequently difficult to determine the larger vegetation and attention is chiefly directed to the numerous species of *Selaginella*, *Hymenophyllum*, *Trichomanes* and *Polypodium*, the growth of which is encouraged by the shady conditions and moist atmosphere.

The vegetable products of the Colony are of considerable importance, and include Sugar, Rice, Coffee, Cocoa, Cocoanuts, Limes and other fruits, Cassava, Corn, Yams, Sweet Potatoes, gums, oils, fibres, rubbers and timbers. The sugar industry is by far the most important and probably Sugar and its by-products find employment, directly or indirectly, for half of the population.

The timber industry is of great importance and offers tremendous opportunities for development by the introduction of modern methods of handling. The great difficulty is that of transport, and the forests at present worked are only those in easily accessible districts. There is said to be upwards of 70,000 square miles of virgin forest. The timbers are very varied in their values and uses, and no fewer than two hundred varieties are listed as common, and twenty-five as valuable. That of the Greenheart (*Nectandra Rodioei*) is of the greatest commercial importance at the present time. It occurs in an area of 20,000 square miles of forest land, and in one area of 2,360 square miles it is estimated that 300,000,000 cubic feet of this timber is ripe for cutting, whereas the present rate of exploitation is only about a quarter-million cubic feet per annum. It is placed second of the eight woods rated A.1 at Lloyds for ship-building, Teak being the only wood superior to it. The "Fram" was strengthened throughout with it, and the "Discovery" built with it. The timber is more immune from the attacks of "Toredo" in salt water than any other, and experience at Singapore and the Mersey and Newcastle docks shows that immersion for a period of over fifty years has had practically no effect on it.

Para Rubber (*Hevea brasiliensis*) grows freely on the well-drained flat lands along the banks of the rivers and there is no doubt that a large area is eminently suitable for its cultivation, but owing to a serious outbreak of the South American leaf diseases and the low price of the commodity in recent years, the industry has not made much headway. The production of Balata, as the coagulated latex of the Balata tree (*Mimusops globosa*) is called, is, however, an important industry. The gum is used in the manufacture of belting and shoe soles, and the demand is considerable, no less than 1,500,000 pounds having been exported in one year.

The production of fibres is very little developed and although trials have been made with the growth of Cotton, little success has been achieved, as introduced varieties are not able to withstand the climatic conditions of the coast lands, and the indigenous Tree Cottons give comparatively low yields. Fibre is prepared from a species of *Bromelia* cultivated in the north-west district for this purpose. The fibre is strong, of good and bright appearance, and is used for making cordage and hammock ropes. An excellent fibre is also obtained from *Malachra capitata*, said to be little inferior to Jute, but it is not at present produced on an important scale; nevertheless, the production of fibres offers important possibilities in the development of the industries of the Colony.

Rice-growing has made considerable advance in recent years, and the amount grown, besides meeting local demands, supplies a considerable proportion of the needs of French Guiana and Dutch Guiana and the West Indian Islands. The flat, heavy, coastal lands that have been abandoned after sugar, make excellent Rice lands, and there are very large areas in the colony eminently suited to the cultivation of Rice. The varieties most largely grown are Creole

and Berbice Creole, but long-grained varieties are being introduced and meet with favour owing to their heavier cropping capacities. The methods of cultivation generally are primitive, and most of the work is done by hand labour. In many districts the field work is carried out by primitive ploughs and harrows. Cattle are used for the trampling out of the

PLANTS NEW OR NOTEWORTHY.

MECONOPSIS SIMPLICIFOLIA.

I AM sending a photograph (Fig. 28) of a *Meconopsis* that has flowered in my garden in Perthshire during the last three years.

FIG. 29.—*ECHIUM SCILLONIENSIS*.
(see p. 72.)

grain and winnowing is done by hand. Improved methods of cultivation are being introduced in some districts on a fairly large scale with gratifying results, and it is not improbable that British Guiana may rank eventually as one of the most important Rice-producing countries of the world. *W. Auton.*

The remarkable thing about this *Meconopsis* is that it is perennial. In the spring of 1924 I sowed home-saved seed of *Meconopsis simplicifolia*, Bailey's form. The plants flowered in the following year, including the one shown in the photograph, which instead of being blue, had pale yellow flowers.

While all the plants of *Meconopsis simplicifolia* which flowered, seeded and died, this plant bloomed the following year, and again this year. It comes into flower in early April and was still in flower at the end of June.

On counting the flower stems on June 29, I found that it had twenty expanded flowers, and there were still two or three buds to open. The first flowers to open measured eight inches across, developed on stems eighteen inches high, which spring straight from the stock, not like *Meconopsis integrifolia*, whose flowers branch from a central stem.

This plant sets seeds, but apparently they are not all fertile, as I could not get any to germinate the first two years it seeded. I have, however, three seedlings from last year's seed, and I am looking forward to seeing these seedlings flower, to find if they prove perennial like the parent plant.

As I grow *Meconopsis integrifolia* and *M. simplicifolia* near each other, could this plant be a hybrid from these two species? The flowers are pale yellow, much lighter in colour than those of *Meconopsis integrifolia*, but the habit is like that of *M. simplicifolia*, which flowers on single stems.

If this is a hybrid from these two species, which are both monocarpic, how can one account for it being perennial?

I shall be glad to hear if any of your readers who grow *Meconopsis* have had a similar experience. *Andrew Harley, Blinkbonny, Kirkcaldy.*

MR. HARLEY has raised a very interesting plant, which throws some light on a puzzle I met with in Tibet in 1924, where I found an ivory-white *Meconopsis* ('Ivory Poppy' K.W. 5,766, Fig. 30). This plant was very rare, and it grew with the sky-blue *M. simplicifolia*. However, it set very little seed, and that, apparently, did not germinate, which agrees with Mr. Harley's experience. At first I thought this 'Ivory Poppy' might be a growth form of *M. pseudointegrifolia*, which grew not far away; subsequently I decided it was a colour form of *M. simplicifolia*, but I did not notice it was perennial. That is a curious point, but *M. simplicifolia* itself is sometimes polycarpic, or of limited perennial growth; it may be largely a question of vigour and suitable soil conditions, or climate. I doubt if Mr. Harley's plant has any *integrifolia* in its make-up. Yet, in so far as it has yellow, not white flowers it is a remarkable plant, because there is hardly another known example of a *Meconopsis* within the same species limit, varying from yellow to blue. I say 'hardly,' but there is a pale creamy-yellow, almost white, form of *M. Wallichii*, raised both by Mrs. Walter Jones, in Scotland, and by Mr. Armytage Moore in Ireland, with which it may be compared. It will be interesting to see whether the blue forms of these plants can be raised from seeds saved from the cream or yellow flowers. Perhaps Mr. Harley would say what are the colours of the filaments, style and stigma in his plant! *F. Kingdon Ward.*

MECONOPSIS BAILEYI (?)

ON p. 449 vol. lxxxi. of *Gard. Chron.*, Mr. Grant White, writing from Wisley, refers to this *Meconopsis* as perennial, and as sometimes confused with *M. betonicifolia*. On the same page, Mr. McCutcheon, writing from the Edinburgh Botanic Garden, refers to the plant as *M. betonicifolia*, and infers that it is biennial. In the *Annals of Botany* (No. CLIX, July, 1926), Capt. Kingdon Ward, who found the plant in 1924, in Major Bailey's original (1913) station for it (Lunang) and at the same time of year (July), makes it perennial, and would separate it from *M. betonicifolia* because of the longer style of the latter, the auricled base of the stem leaves and the almost glabrous capsule. Capt. Ward is for removing both *M. betonicifolia* and *M. Baileyi* from the section *Bellae* to *Polychaetia* on the ground that both species have barbellate hairs.

This *Meconopsis*, of which so admirable a photograph was published (Fig. 217) on p. 449, has been available to planters for two years, and though there is ample material in the country

for the fullest investigation into the synonymy of Capt. Ward's plant, the mist of uncertainty which settled on it at its first public appearance does not seem to lift as time goes on. Is it too much to hope that Sir David Prain, whose work on *Meconopsis* has already placed students of the genus under a lasting debt, may be induced to add the weight of his authority to a specific determination of the position of the Wardian plant?

The question of the perennial or monocarpic character of the plant will, no doubt, settle itself, and it is premature to assume that this Poppy is perennial in Great Britain because of its tufted habit of growth. It is already known from experience that the individual crown dies after flowering, and if the claim advanced for the plant that it is perennial, depends on its ability to throw out side-shoots, as it usually (but not always) does, it would be wiser to suspend judgment on the point, for other species of *Meconopsis* which are known to exhibit the same peculiarity, are monocarpic. Plants of *M. latifolia*, for instance, have been known to go on for two years in succession and occasionally for longer periods.

The fact that Capt. Ward's *Meconopsis* has flowers of different shades of blue, and even pink and blue, on the same plant, presents an interesting problem to physiologists and is hardly to be explained by soil conditions. *Amateur.*

ECHIUM SCILLONIENSIS.

It may interest your readers to see a photograph (Fig. 29) of *Echium scilloniensis* growing in this garden. Major Dorrien Smith, of Tresco sent me the seeds in 1925; the plants were put out in March, 1926, and passed safely through last winter unprotected. This *Echium* is probably a hybrid between *E. calythrsum* (perennial) and *E. pinnianum* (biennial), and appears to be a perennial. The plant illustrated is thirteen feet high, and the largest flower spike measures seven feet in length. My gardener, Mr. Buckman, who grew the plant, is standing by it. The seedlings show several shades of colour, from pink to dark blue. Our plants are growing in a calcareous loam. *F. C. Stern, Highdown, Goring-by-Sea, Sussex.*

THE TREATMENT OF BOG AND MARSH LAND.

It is not unusual to find a tract of bog or marsh land as a natural adjunct to a demesne, generally in vale gardens, where the water draining from the hills collects to form a swamp and wherever such conditions exist it is possible, by judicious treatment, to make a notable addition to the amenities of the garden.

The first essential to the materialisation of a pleasing result is to forego all formality; paths in the vicinity of the bog and those actually directed to it should partake rather of the nature of mere tracks, sufficiently spacious for comfortable use and rendered serviceable by the introduction at intervals of flat and irregular stones. Similarly, the passage of the bog itself may be rendered practicable by stones, tastefully displayed and submerged to half or rather more, of their depth.

The whole environment, indeed, should gradually and elusively emerge into the marsh; every effort should be made to devise a scheme of planting which will eventually result in a gradual and almost unnoticeable junction of garden and bog.

If the contour is flat, better and more picturesque results will accrue from the creation, preferably on the north or north-eastern side, of a hillock, gradually rising well away from the bog and finally "fading" into a planting of suitable trees, preferably of a Coniferous character. The tree plantation should be at an appreciable distance away, otherwise the ultimate effect will suffer; the ground between the Conifers and edge of the marsh may be advantageously planted with such subjects as

Bamboos in variety, various Willows, *Heracleum giganteum* (the Giant Cow Parsnip) and such giant *Polygonums* as *P. cuspidatum* (Sieboldii of gardens); and *P. sachalinense*.

In the rather moister ground adjoining the margin of the bog, an occasional *Gunnera*, with such Ferns as *Osmunda regalis*, *Struthiopteris germanica*, *S. pennsylvanica* and *Onoclea sensibilis* will create a noble effect; on the opposite margins, considerable colonies of *Astilbe*—the *Arendsii* hybrids are very beautiful—Iris sibirica, *Hemerocallis* and *Senecio clivorum* will create a pleasing colour display. Do not attempt fragmentary planting, rather adopt a policy of bold massing, finding relief in an occasional specimen of goodly proportions, such as a plant of *Phormium tenax*, *P. Cookianum* or *Gunnera*.

Stretches of the Sedges (*Carex*) will be in character and harmony, whilst spreading from the marsh edge through the Bamboos to the coppice, sheets of *Epilobium angustifolium*, *E. a. alba* and *Lythrum roseum* Lady Sackville, *L. virgatum* Rose Queen, *L. atropurpureum* and *L. Carmine Queen* will provide a fine colour setting.

I strongly advise the introduction of one or more good specimens, according to the extent of the treated ground, of the deciduous Cypress, *Taxodium distichum*; the green, Fern-like foliage is beautiful in summer and the resplendent autumnal colouring of this tree is ever a noteworthy feature.

As to the bog itself, the arrangement of a considerable collection of plants and the selection of these is indubitably a matter for individual taste. Primulas will naturally occupy a goodly share of attention and are never more pleasing than when intermingled with such graceful Ferns as *Lastrea Thelypteris*, *Adiantum pedatum*, *Asplenium thelypteroides* and *Woodwardia virginica*; the Primulas should be planted generously, of such species as *P. japonica*, *P. Beesiana*, *P. Bulleyana*, *P. involucrata*, *P. sikkimensis*, *P. helodoxa* and the exquisite *P. rosea*.

Iris Kaempferi should predominate largely; of a very wide selection of varieties, outstanding sorts are *Admiration*, *Fugimini*, *Pieter de Hooghe*, *Tokyo*, *Van Dyk*, *Yourishima*, *Osaka*, *Heinrich Witte* and *Giovanni*; of other Irises, excellent effect will result from massed *I. Pseud-acorus* (the native yellow Iris) and smaller drifts of *I. Monnieri* and *I. orientalis*.

A shady corner may form a home for some of the North American *Cypripediums* and other hardy Orchids, including the brilliant *Calopogon pulchellus*; it should not be a difficult matter to introduce a little peat for these interesting plants, and provision may likewise be made, with a few stones, some peaty soil and *Sphagnum* moss, for such insectivorous plants as *Darlingtonia californica*, *Pinguicula grandiflora*, *P. vulgaris* and the native *Drosera rotundifolia*.

Bare mention must suffice for a host of pretty plants that may be included in the bog. *Trollius* in variety, *Funkias* (of inestimable value), *Helonias bullata*, *Butomus umbellatus*, such *Gentians* as *G. Andrewsii*, *G. asclepiadea* and *G. Pneumonanthe*, the brilliant *Lobelia cardinalis*, *L. syphilitica* and varied hybrid forms; *Parnassia palustris*, *Pratia littoralis*, *Sarracenia purpurea*, *S. flava*, *S. rubra*, *Calthas* in variety, *Mimulus* in variety, *Uvularia grandiflora* and many *Spiraeas*.

The gradual passing of the bog into the garden proper may well afford scope for artistic work of high character and may, with advantage, tend towards creating "homes" for *Meconopsis*, a woodland and Lily garden and a Fern garden.

The small and irregular arboretum (before-mentioned) may constitute the confine of the treated space in the one direction, and in all other directions the passing of the bog garden should be gentle, almost illusory.

Early autumn planting is advisable for the stronger-growing subjects, those of more delicate character, such as Orchids and *Lobelias*, being planted in March and April. There is no better time to commence work upon the formation of such a garden than late summer.

Such a piece of work will of necessity be a slow process, and it is better so; additions may be made as experience dictates, and treasures added as they become available. *Ralph E. Arnold.*

ALPINE GARDEN.

PYROLA ROTUNDIFOLIA.

THIS beautiful, hardy, native perennial is well worthy of a position on the rockery; for preference, a moist, half shaded situation, and planted in a compost of a light, sandy nature. At this period of the year the plant produces numerous racemes of drooping, white flowers which are exquisitely fragrant, on erect stems from six inches to nine inches in height, rising above the undergrowth of dark green leathery foliage.

P. arenaria is a maritime variety of the type, one of the differential characters being that several scale-like bracts are produced below the inflorescence. This variety enjoys a somewhat sunny position, a compost mainly composed of sand, and abundant moisture at the roots. Once planted, attempt at root disturbance must be avoided, and to assist naturalisation, the grasses around the clump should be allowed to remain except, of course, for an occasional clearing to prevent the weeds from smothering the *Pyrola*.

In collecting plants for transportation from their natural habitat to the rockery, it is absolutely useless to select small portions; whole squares should be dug up bodily, so to speak, and transplanted in such a condition in a suitable position.

Perhaps the method advocated may prove rather laborious, but it is well to remember that in thoroughness lies the secret of success.

Propagation may be effected by division or the sowing of seeds. In seed-sowing it is advisable to sow on the site where the plants will be grown, in April, as loss of plants transplanted from pans is great. During the growing period throughout the summer, copious supplies of water will be necessary. *T. D. Boyd.*

DIANTHUS ENID.

I HAVE previously drawn attention to the merits of this charming little *Dianthus*, and it is with pleasure that I observe it is finding its way into the catalogues of nurserymen who make a special feature of good hardy plants. It was growing in my old garden for about four years, and in early May it was removed to my new garden, where it seems to be happy, and is flowering and giving great pleasure with its carpet of small, deep-green leaves and dark crimson flowers.

I have no knowledge of its parentage, but I always surmise that one of its progenitors must have been a good form of *Dianthus deltoides*, the Maiden Pink. It is quite hardy and may be increased from cuttings or by division. I have not sown seeds, which it produces, but it is probable that in course of time some equally charming varieties might be derived by means of sowing them and of selecting and re-selecting the progeny when in flower. *D. Enid* will succeed in ordinary light loam, and I have never tried it in any but a sunny position.

DRACOCEPHALUM ISABELLAE.

THIS *Dracocephalum* is at present in bloom in my garden, and I regard it as one of the most valuable plants of recent introduction. Its flowering period is stated to be July and August, but with me it bloomed in the first week of July, although this cannot be called an early season, and one in which plants have had many vicissitudes to contend with.

D. Isabellae is an ideal plant for the rock garden or the front of the hardy flower border, but the former is certainly the more appropriate place for such a charming plant.

It grows about nine inches high, and has narrow, graceful foliage on upright stems, and at the summit a raceme of large, deep purple-blue flowers. These are of the true "Dragon's Head" form and, taking it altogether it is a most distinct and exceedingly worthy plant. Its hardiness has been proved by others; it is planted in my garden near the base of the rock garden on a level terrace of moderately good loam. *S. Arnott.*

THE FLOWER GARDEN AT AMPHILL PARK.

THE history of the flower gardens and shrubberies of Ampthill Park dates back upward of three hundred years. Although not outstandingly extensive (ten acres), their historical associations and lay-out are worthy of more than passing interest. The enclosure of the grounds is made complete by a moat, while the situation is in one of the highest and most undulating parts of Bedfordshire.

King Henry VIII must have trodden the grounds of the present flower gardens when hunting deer in the park and surrounding woods—the present gardens being then a wood; and also that unfortunate lady, Queen Catherine of Aragon, King Henry's first wife, must have spent many unhappy hours here during her

FIG. 30.—THE IVORY POPPY.

(see p. 71.)

tenancy of the Royal Castle, pending the divorce proceedings. The royal castle has disappeared ages ago, but its site is marked by a monument erected and still standing to the noble Catherine, concerning whom Horace Walpole wrote:

"In days of old here Ampthill's towers were seen,

The mournful refuge of an injured Queen;
Here flowed her pure but unavailing tears,
Here blinded zeal sustained her sinking years.
Yet freedom hence her radiant banner waved,
And love avenged a realm by priests enslaved;
From Catherine's wrongs a nation's bliss was spread,
And Luther's light from Henry's lawless bed."

The celebrated third Lord Holland and Lady Holland lived here, the name of the latter, it will be remembered, being often associated with the introduction of the Dahlia to this country. Such famous political personages as

Pitt and Fox sojourned here on various occasions, after having made their journey from London by the old stage coach.

The famous Lime Avenue, upwards of a quarter-of-a-mile long, has been declared to be one of the finest of its kind in England, rivalling Addison's famous walk at Oxford. At the lower end of this avenue stands the house, Georgian in structure, with thirty-two flower beds immediately in front, and Rose beds and lawns beyond. These beds are, probably, as originally designed, formal in outline and surrounded by the once much-prized Box edging. Sixteen of these beds are arranged on each side of a spacious gravelled area, a circular fountain bed occupying the centre. On the south side of the mansion are the permanent features of a flower garden, flowering shrubs, clumps of Pampas Grass, Paeonies, Torch Lilies, Anemones and Rheums, all in beds. Here, also, is a large herbaceous border of irregular outline, and this, by the way, has a fine background of Yew trees, which provides a good setting for most flowers and a great deal of protection from inclement weather. This border and other improvements were largely the creation of the late Emily, Lady Ampthill, who resided at Ampthill Park for upwards of forty years. Her Ladyship was aunt to the present Duke of Bedford, owner of the Ampthill Park estate.

Further along are the blue and yellow borders and further on again the pink and white section of the garden. The latter comprises a pergola clothed with pink and white rambling Roses, while a narrow bordering of the Madonna Lily fronts the entire length of the structure. On the opposite side of the path is a huge bed filled with rose-pink Pentstemons, a group or so of white Pentstemons, or the white-flowering Tobacco with some pink-flowered plants of the same family. The blue and yellow beds are filled with blue and yellow Irises on one side of the walk, while a semi-circular bed on the other side is planted with hardy blue Geraniums, blue Veronica, Spiderwort, Nepeta, Anchusa, the blue annual Pimpernel and Ageratum, with golden Privet at the back, and a group of St. John's Wort at one end. The special charm of all these beds and others is that they have been carved out of the surrounding woodland, and a visitor is unaware of their position until suddenly confronted by the flowers.

To this brief reference of cultivated plants I would add another word concerning the Primrose, which thrives so perfectly in the woodland. The ground occupied by these "early nurslings of the year" is probably not less than two acres. Here a drift, there a large colony, their crimped leaves and pale yellow blossoms also spangle much of the rougher lawn and Ivy-covered woodland. No fairer sight can be imagined. As Wordsworth says:—

"Long as there's a sun that sets
Primroses will have their glory."

Primroses are among the most beautiful of our wild flowers, and no flower is better fitted for naturalising in the borderlands which come between the garden proper and the woodland or coppice. *C. T.*

CONTRACTS OVER THE VALUE OF £10.

IN the case of contracts for the sale of goods where the value of the goods transferred exceeds £10, the special rules set out in the Sale of Goods Act of 1893 must be complied with. Before referring to these rules, however, it is necessary to discover when they will have to be applied, for after a short consideration of the subject two questions arise (a) what is a sale of goods, and (b) must each article be over £10 in value, or does the Act refer to a number of articles together making a total of £10?

According to the Act, a contract of sale of goods is a contract "whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price." Thus, where one lot of goods is exchanged or "bartered" for some other goods,

this is not a sale, and the Act does not apply; there must be a transfer of goods by one person to another for a sum of money.

It has been stated that the Act only applies where the contract is over the value of £10. Does this £10 mean the price of each separate article, or does it refer to all the articles sold? If the purchase price of one transaction is £10, then the Act will have to be complied with; thus, if twenty-five Rose trees were bought and the total price amounted to £10, this would come under the provisions of the Act, but if on the other hand, trees costing £8 only were originally purchased, and then later it was thought wise to buy some more, and trees costing £2 were ordered, neither of these sales would appear to be within the Act. Thus it is not each article which must be considered, but rather each transaction, and if this amounts to £10, then the special rules must be complied with.

FORMALITIES OF THE CONTRACT.

In order that a contract for the sale of goods of the value of £10 may be enforced, one of the following alternatives must have happened:—

- (1) Acceptance and actual receipt of the goods;
- (2) A payment in earnest;
- (3) Part payment, or
- (4) There must have been some note or memorandum in writing signed by the delinquent party.

Dealing with these in the above order: if one party accepts the goods he has agreed to buy, he will have to pay either the price agreed or else a reasonable price for them.

A payment in earnest—a very rare occurrence—is the payment of a sum of money to bind the bargain; what more often happens, however, is the third example, that is, part payment of the price; and where this has taken place the contract is considered binding.

The last example is the most important: some note or memorandum signed by the delinquent party. It is most important that some memorandum signed by the other party should be obtained whenever a contract of £10 or upwards is made. It is not essential, however, that it should be signed on the making of the contract, for it is enough that it is in existence when it is desired to enforce the contract in a Court of Law. Even a letter which purports to repudiate the contract may be enough, if it recognises that a contract has been made. The note must, however, in the first place, be signed by the party to be charged, it must also show the names of the parties, the goods and the price. If no formal contract has been signed, sufficient evidence can often be gathered from a number of letters written in reference to the contract, these will be signed, they will be addressed to the other party (an envelope can be connected with a letter) and probably they will refer to the price and the goods in question. In view of this, it is always wise to save any letters and envelopes received in connection with transactions over £10, as these may well provide useful evidence for enforcing the contract. It is, however, wiser still to obtain a written note of the contract signed by the other party.

Harold Sharman.

KENSINGTON GARDENS.

KENSINGTON Gardens, nowadays, forms an appendage of Hyde Park, the two open spaces together constituting the largest area of its kind in the London district. The Palace at Kensington, together with some twenty-six acres of ground, originally belonged to the Earls of Nottingham and was known as Nottingham House. It was purchased from the Earl of Nottingham by William III, who laid out the grounds around it with the help of the famous Le Nôtre, but subsequently London and Wise were employed as garden architects, and when the additions to the gardens were made by Queen Anne, Wise alone was employed. The famous Orangery was erected by Wren in Queen Anne's time, and was originally used as a banqueting house; in the time when the frame

ground existed, this beautiful building was used for the housing of barrows, tools, etc., of the gardeners.

The greatest additions to the place were made by George III and Queen Caroline, who employed Bridgeman to lay out three hundred acres which were enclosed by them, and it is probable that in those times the gardens included the part on which Kensington Palace Gardens are now built, for the total area of Kensington Gardens nowadays is only 274½ acres. Kensington Palace itself is historical from the fact that Queen Victoria was born there in 1819; she was very partial to the place, for much of her childhood was spent there. It is to Queen Victoria the public owe the privilege of having access to this beautiful open area; at first only "respectably dressed persons" were allowed to enter the gardens from sunrise to sunset, but after the Palace ceased to be a Royal residence, the gardens passed under the control of the Office of Works, and it now constitutes one of our most famous public parks.

Those who knew Kensington Gardens some thirty years ago would scarcely recognise the part in the vicinity of the Palace as it now appears, for the old houses and pits, which were used for the propagation and growing of the various bedding subjects and the housing of Palms, etc., used out-of-doors in Hyde Park during the summer, were accommodated in what was known as the Frame Ground, the site of which is now occupied by a sunken garden, and the part in front of the old Orangery is laid out with wide lawns enclosed by an embattled Privet hedge, near which is a row of scarlet Thorns, while down the broad walk in the centre are some grand Bay trees, alternated with fine Hollies.

The Dutch garden occupies about half-an-acre of ground with a large rectangular pool in the centre. The pool is approached by flights of steps leading past three broad terraces in which numerous flower beds are planted with a variety of subjects, no fewer than twenty thousand bedding plants being utilised at the present time. The whole of this sunken garden is a blaze of bright colour, and we were informed that flowers are in bloom there for eleven months out of the twelve, for it is a very favoured spot. Most of the beds are massed with one kind of plant; the subjects employed include Delphiniums, Sidalceas, Frigerons, Aretotis grandis, Verbena venosa, Scabious, Balsams, Heliotropes, Violas, Dahlias, Gladioli, Chrysanthemum maximum laciniatum, Petunias, Pansies, Antirrhinums, Pentstemons, double Shirley Poppies, Viscaria cardinalis and Cheiranthus Allionii.

Along the margins of the pool are placed tubs containing dwarf Dahlias, and on the short columns by the stone steps are tubs of Agapanthus in bloom. Many beautiful Nymphaeas are planted in the water, and not the least interesting of the features are the old leaden cisterns in the water, some of which date from 1600. The whole of the sunken garden is enclosed by a pleached alley of red-twigged Limes, and at every few yards an opening has been made in the alley to permit of a view of the interior of the garden.

This year, Mr. Hay has added further to the amenities of this beautiful part of Kensington Gardens by planting a long border with Sweet Peas on the east side of the sunk garden, a supplementary illustration of which was given in *Gard. Chron.*, October 16, 1909, just after it was completed.

The sunk garden is a comparatively modern feature, but the flower walk in Kensington Gardens has existed for a long number of years, and here again the improvements have been so great in the past few years that those who have not visited it for a decade or two would be agreeably surprised at the change. The flower walk consists of a broad path with borders on either side extending to five hundred yards with a most beautiful setting of trees and shrubs in the background. The trees include fair specimens of *Cotoneaster frigida*, *Crataegus coccinea*, *Gymnocladus canadensis*, *Liriodendron tulipifera*, *Quercus Suber*, the Cork Oak; *Ailanthus glandulosus* and *Aesculus hybrida*.

Probably because the flower walk was so

beautifully natural, former superintendents did not attempt a great deal in the way of flowering plants; indeed, we remember the time when it received only the odds and ends of the bedding plants after Hyde Park and other places in association with it had been satisfied, but Mr. T. Hay, the present Superintendent, realised the great possibility of making this one of the most beautiful features in any of the London parks, and has transformed it into a fairy place, quite altering the original style and bringing into greater prominence some of the more notable trees by removing the undergrowth of commoner shrubs, laying down turf at appropriate spots and making numbers of flower beds at points of vantage. A fine old Weeping Ash, for instance, which was formerly half hidden by Privets and Laurels has been relieved of its undergrowth so as to be seen in its full beauty, and in front of it a border of Coltness Gem Dahlias has been planted.

All along the border are great masses of such plants as Shasta Daisies in several fine varieties; the beautiful scarlet Carnation King Arthur; *Lychnis* (*Agrostemma*) *Coronaria*, *Aconitum Napellus* (*pyramidale*) in association with *Marguerites*; *Coreopsis grandiflora*, *Veronica longifolia subsessilis*, Sweet Williams, *Heliotropes*, *Dianthus Crimson Bedder*, *Trachymene coerulea* in association with Marigold Legion of Honour, and a fine strain of *Primula pulverulenta*, which is just passing over.

A special feature of interest in this flower walk is a bed planted with a variety of plants, some of which have never flowered before in England. They were gathered together by Mr. Hay from various sources, and as each plant is labelled with the country of origin, the cosmopolitan character of the bed has earned for it the name "The League of Nations" by the public. We can only enumerate a few of the more interesting of the plants in this unique bed, which is not of a very large size. They are *Sabbatia campestris*, which was illustrated in *Gard. Chron.*, August 7, 1926, and received the R.H.S. Award of Merit on Tuesday last; *Meconopsis Wallichii*, M. Baileyi, *Lisianthus* (*Eustoma*) *Russellianus*, *Dahlia Merckii*, a species from Mexico, which is exceedingly beautiful when in flower; *Linaria triornithophora*, *Anthemis Sancti-Johannis* (figured in *Gard. Chron.*, October 2, 1926); *Hibiscus diversifolius*, *Primula effusa*, a dainty little species somewhat like *P. malacoides*; *P. florindae*, which seems to do remarkably well in the smoke-laden atmosphere of these gardens; *Lupinus rivularis* (*cytisoides*), *Cineraria Moorei*, *C. lobata*, a dwarf, yellow-flowered species; *Commelina coelestis* and *Rosa Roulettii*, the last not more than three inches high, and bearing several tiny pink blossoms.

Other rare and interesting plants included are of a garden nature, amongst them a very fine *Sphaeralcea* named Hascombe Bronze; a number of interesting varieties of *Mimulus*, including Giant Bronze, the large flowers of which are beautifully blotched with crimson on a yellow ground and with orange coloured upper petals; *Agrostemma Abbotswood Rose*, a glorious variety of this beautiful old plant; *Salvia Sclarea*, Vatican variety; a variegated leaved form of *Gazania splendens*, and *Calceolaria* L. B. Stewart, a most glorious *Calceolaria* with deep orange flowers marked with darker spots.

APPLE AND PEAR SCAB.

(*VENTURIA INAEQUALIS* AND *V. PIRINA*.)

APPLES and Pears are subject to many diseases, but in all probability Scab does more damage than that caused by all the rest put together. There is no doubt that the incidence of scab is, to a large extent, seasonable. In gardens where control measures are not carried out every year a certain number of Apples and Pears are mis-shapened, cracked, or badly marked in some other way; in other years, the majority of the crop is so marked.

When control measures are undertaken against Apple and Pear scab it is done with a view to reducing the fungus to such an extent

that the majority of the fruits are free from injury. If these control measures are properly carried out there is no doubt that this object can be attained, but to those who are attempting to fight Apple and Pear scab for the first time, it would be as well to point out that the two organisms concerned are extremely good fighters, and if the attacker is to be successful he must use all his weapons, at the right time and in the right way.

My object in writing this note is not to give the full control measures for fighting these diseases, but rather to remind those whose Apples and Pears are missing a crop this year that it is a good opportunity for adopting spraying operations to control Apple and Pear scab without any damage to the crop. With some spray fluids, a certain amount of fruit-dropping in June has been recorded, so that, especially with Apples, there is always a risk of some loss of crop following spraying. When the trees are carrying no crop it is at least a good spraying opportunity.

Two fungicides are in common use against Apple and Pear scab, namely Bordeaux mixture and lime-sulphur. It is claimed that the former is a much better control for scab than is lime-sulphur. It seems to me that if only a small quantity of spray fluid is required it is best to use lime sulphur, because it may be purchased in concentrated form, and only requires the addition of water to be ready for use; when large quantities of spray fluid are required it is cheaper and more efficient to use Bordeaux mixture.

Spraying carried out now will do much to reduce Apple and Pear scab infection on the leaves and young wood of these trees. I would remind those who are spraying Pears that the fungus concerned mainly attacks the underside of the foliage, so that it is necessary to try and coat the underside of the leaves with the spray fluid used. With wall Pears, however, this is not easily done. *Somerset.*

NOTICES OF BOOKS.

Pictures of English Gardens.

THE book published recently by Country Life* cannot fail to delight all who are interested in the creation and improvement of gardens. It is a beautiful picture book, and—which is not always the same thing—a book of beautiful pictures. Every illustration in the 192 quarto pages depicts some charming garden scene, and all are finely reproduced from first-rate photographs. But this book is not mainly a collection of garden pictures from all parts of England; it is an instructive book inasmuch as the pictures show how certain sites may be beautified by flowers, shrubs and trees, and will prove suggestive to those who have somewhat similar positions to beautify, but do not possess creative genius in a marked degree, nor the wisdom that comes from long experience of gardens and garden plants.

There is an introduction by Mr. E. H. M. Cox, in which he refers to the wide-spread love of gardening and its development in the British Isles; discusses various types and sizes of gardens from the "small plot to anything over two acres"; and has something to say about types of gardeners. Then follow a few hints in regard to lay-out, exposure, shelter, soil, rainfall and surroundings. In conclusion, the author states eight general rules in regard to the upkeep of a garden; of these we quote two: "Do not be too proud to learn from the successes and failures of others. The more experienced a gardener is, the more he realises how much he can learn from others." "Above all, be generous in your gardening. It is the most popular hobby in the world, and this popularity has arisen from the common bond, a love of plants, that all real gardeners have."

Plants and plant-grouping are not dealt with, but there is a useful index to the plants and scenes depicted, and the illustrations tell

their own story—and a very beautiful story it is. The Flower Borders (pp. 7, 61 and 66), Foxgloves (p. 141), Cedars (176), Polyanthuses (p. 136), Crocuses (p. 130), Topiary and Tulips (p. 117), Rose Garden (p. 108), Alpine Garden (p. 84), Wall Garden and Pergola (p. 57), Garden Gate and Steps (p. 46), Pergola and Lilies (p. 39), Water Garden (p. 30), Old-fashioned Garden (p. 9), Formal Garden (p. 28), and the Terrace Garden (p. 1), are among the most pleasing pictures in a very fine set.

VEGETABLE GARDEN.

LATE CARROTS.

To obtain supplies of young, tender roots for use in the autumn, seeds of Short Horn Carrots or of the intermediate varieties should be sown forthwith. It is not necessary to choose rich soil for Carrots; the ground should be dug deeply previous to sowing the seeds, and afterwards trodden fairly firmly.

So soon as the seedlings are large enough to handle, thin them sparingly, for young Carrots are much appreciated in autumn, and may be drawn out of the rows for use when small.

TURNIPS.

MAKE a sowing of the following varieties: Early Six Weeks, Green Top White and Red Globe. The roots will grow to a useful size by September and onwards. If other ground is not available, sow them where the early Potatos have been lifted. Make several sowings up to the second week in August, according to the amount of ground available. Thin the seedlings sparingly as advised for Carrots; the roots are most useful when grown to the size of tennis balls.

CABBAGES.

THERE are many varieties of Cabbage that turn in very quickly, such as Harbinger, Favourite, Little Gem and Sutton's Earliest.

Cabbages should be grown on fairly rich soil that has been manured and dug deeply. The plants will grow very quickly and make nice, tender heads by the autumn.

SALADS FOR LATE USE.

LETTUCE seed may be sown about every ten days or a fortnight, choosing such varieties as Nonsuch and Little Gem. The plants will form nice, compact heads in much less time than the white Cos sorts. A sowing may be made of the latter at the same time to extend the season. There are many sorts of Cabbage Lettuces, but I have not found any variety better than all the Year Round for a late supply; Stanstead Park does not form such good heads.

As shorter days approach, all Lettuces should be planted on borders or in cold frames, where they may be protected from early autumn frosts and very heavy rains.

The soil for this crop needs to be well enriched with short stable manure and dug deeply previous to planting the young Lettuces, which should be given plenty of water in hot, dry weather in their early stages.

Continue to sow seeds of the most favoured sorts of Radishes; these again should be grown quickly to be tender.

Continue to sow Endive; the round-leaf variety is better for late use than the curled sort, as the latter is subject to damping. Endive should be planted on borders where protection can be given from frost and damp; if available, place cold frames over the plants so that the light can be placed in position when the weather is unfavourable. These plants, like Lettuces, require to be grown quickly in suitable soil, to produce good hearts. A little Onion seed may be sown in the open to obtain salad material in the autumn. They may be grown in any ordinary ground. *E. Neal, Tilgate Gardens, Crawley.*

HOME CORRESPONDENCE.

Lime and Soot as a Deterrent to Birds.—In his notes on lime and soot in the garden (p. 450, Vol. LXXXI), Mr. Saunders advises a mixture of lime and soot as a dressing for small seedlings. I do not find it necessary to wait until the ammonia fumes go off before applying it, for I have always regarded the fumes as the principal deterrent to attacks of birds on small seeds. I apply it so soon as mixed and have never seen the least harm done to seedlings, although I have used it on almost everything for many years. It is the only thing that will prevent the Turnip flea from clearing off young seedlings in dry weather. I use old soot and air-slaked lime, but if both are absolutely dry, the ammonia fumes do not rise very readily; in that case I mix a handful of moist earth with the soot before adding the lime. Three handfuls of lime is sufficient to release the ammonia in a bucketful of soot. *Grigor Roy, Stoke D'Abernon Manor Gardens, Cobham, Surrey.*

Lorette System of Pruning.—Some time ago, a correspondent enquired in your paper if any one had tried the Lorette system of pruning. I have tried it for two seasons with Apples and Pears, and find it fulfils all that is claimed for it. The system of "snicking" the bark to produce growth in a dormant bud has answered invariably. I have not taken much trouble as yet about Plums so prefer to say nothing about them. I have not tried the system at all with Nectarines and Peaches. I find in this part of England the pruning should be carried out a fortnight to three weeks later than stated in Lorette's book. With old trees, the new pruning should be spread over a term of three years. Trees, three years' old, that have been directly pruned on the Lorette system have done best. There is a vast difference noticeable in a tree partially pruned on the old and partially on the new system. It would be interesting to hear the opinions of other correspondents. *H. Impey, Felsted, Essex.*

PUBLIC PARKS AND GARDENS.

THE Kesteven County Council has granted permission to the Metheringham Parish Council to borrow £200 for purchasing, fencing and improving a recreation ground.

KIDDERMINSTER Town Council has accepted the gift of the directors of Messrs. Brintons, Ltd., carpet manufacturers, of a park and recreation ground for the town.

THE Town Council of Dundee has agreed to purchase certain land at a cost of £475 for a recreation ground, and the Parks Committee has been requested to prepare plans and an estimate for laying out the land.

AN instance of the urgent need of playing fields in industrial areas comes from Salford, whose Town Council has applied to the Ministry of Health for a loan of £28,076 to acquire eighty-seven acres of land as playing fields at Lower Terrel. The Playing Fields Association has taken a keen interest in this scheme, and representatives of the Lancashire branch were present at the public enquiry held by the Ministry of Health.

A SCHEME is afoot at Newport, Monmouthshire, for the purchase of Lord Tredegar's deer park, which is 170 acres in extent, for use as a recreation ground.

ROMFORD Urban District Council has received the sanction of the Ministry of Health to borrow £4,782 for the acquisition of lands in the Collier Row Ward, for a recreation ground.

THE Town Council of Sheffield has been presented with about five-and-a-half acres of woodland for the extension of Endcliffe Park.

SOCIETIES.

NATIONAL ROSE.

JULY 15.—The special show of new Roses, which was arranged by the above Society, and held at the R.H.S. Hall, Westminster, on this date, fully achieved its purpose, for there were nearly one hundred new seedling Roses on view. The majority, which were shown for the first time, were entered in competition for the *Daily Mail* Gold Cup as well as for the Society's medal awards. It will be remembered that the Cup was first offered last year, and that the judges did not consider any variety then shown to be worthy of the award. The principal conditions of the competition were that the Cup was offered to the raiser of the "best, new scented, seedling Rose, which may be of any class but must have perfume." After a prolonged inspection of the many varieties, the judges awarded the cup to Messrs. W. E. B. ARCHER AND DAUGHTER for their dark, velvety crimson seedling, which was said to have been raised from Chateau de Clos Vougeot and K. of K. The judges awarded four Gold Medals and Certificates of Merit.

GOLD MEDALS.

Daily Mail Scented Rose (Fig. 25)—As stated above, the parents of this variety were said to be Chateau de Clos Vougeot and K. of K. In general appearance, the new seedling H.T. seemed to us very like *Etoile d'Hollande*, but not so fragrant as that variety. It is of medium size, globular in shape, and the broad, velvety-crimson petals are flushed with maroon. Shown by Messrs. W. E. B. ARCHER AND DAUGHTER.

Flamingo.—This is a glowing cerise H.T. variety, much the type of *Lady Inchiquin*. It is of beautiful shape and colouring in the bud stage, but when fully expanded the flowers are usually formless and of a dull rose colour. It is sweetly scented. Shown by Messrs. ALEX. DICKSON AND SONS.

Fortuna.—A hybrid Musk Rose of considerable fragrance. It appears to be a very free-flowering variety of dwarf habit and has good foliage. The buds are of deep cardinal red colour. The round, single flowers are about four inches across, and when first opened, are of bright rose-pink colour. It is an attractive garden Rose. Shown by Mr. J. H. PEMBERTON.

Margaret Anne Baxter.—This was the best new seedling in the hall. It is a fully double H.T. variety, the flowers are of perfect shape in all stages, and they are poised well on long, clean stems. It is pleasantly scented and the pure white of the outer petals is relieved by a suggestion of flesh-pink in the heart of the bloom. It is an all purposes variety, and the plant, which accompanied the flowers, indicated a sound constitution and a good habit. Shown by Messrs. T. SMITH AND SON.

CERTIFICATES OF MERIT.

Frank Reader.—This excellent, fully double H.T. Rose received the R.H.S. Award of Merit on July 13 last year. The large flowers are of creamy yellow colour, deeper at the base of the petals and flushed with apricot in the heart of the blooms. It has a pleasant fragrance. Shown by Messrs. D. PRIOR AND SONS.

George Howarth.—We admired this glowing scarlet H.T. Rose at the Society's autumn show last year. It is of medium size, free-flowering, and the substantial petals have a golden base and a suffusion of rose-pink. Shown by Messrs. BEES, LTD.

Lady Leslie.—A rosy-cerise H.T. variety, fully double and of good form, but the outer petals have a suggestion of magenta as the flowers mature. Usually there is a short vertical line of gold at the middle of the margin of each petal. Shown by Messrs. S. MCGREDY AND SON.

Portadown Crimson.—We were of the opinion that this was the best of the new Roses in competition for the Cup. It is a deliciously fragrant

H.T. variety of rich crimson colouring, heavily flushed with maroon. Shown by Messrs. S. MCGREDY AND SON.

OTHER NEW ROSES.

No. 25, shown by Messrs. B. R. CANT AND SONS, is a good H.T. variety of goblet shape. The broad petals are freely stippled with pink, and the flowers are fragrant. No. 37, shown by Mr. J. H. PEMBERTON, is a hybrid Musk Rose which bears plentiful clusters of double, flattish flowers, measuring three inches across, of medium pink colour and most refreshing fragrance; No. 38, a good, pale lemon coloured H.T. Rose, was shown by Messrs. ALEX. DICKSON AND SONS; No. 49 a brilliant H.T. variety, shown by Messrs. S. MCGREDY AND SON, is at its best in the bud stage, but would be a showy garden variety. No. 58 is a rounded H.T. variety of compact form and refreshing fragrance. It is of flesh pink colour, becoming deeper in the centre, and was shown by Messrs. G. LONGLEY AND SONS. There were several enormous H.T. varieties of solid, Cabbage-like appearance, which would only appeal to lovers of mere size.

Several varieties were entered in competition for the Clay Challenge Vase, offered for the best new scented, non-climbing Rose of the year. The final award will be made at the Autumn show.

COMPETITIVE CLASSES.

The trade groups of Roses arranged on separate tables in the middle of the hall made a most effective display. The first prize was won by Messrs. ALEX. DICKSON AND SONS, with a charming arrangement. They had baskets of Betty Uprichard, *Lady Inchiquin* and *Sunstar*, while the corner pillars were composed of good blooms of *Lady Worthington*, *Mrs. Henry Morse* and *Lady Helen Maglona*. In the centre there was a handsome stand of *Margaret Dickson Hamill*. The whole of the many blooms were of excellent quality, and the finish of the exhibit was admirable.

Messrs. B. R. CANT AND SONS were a good second in this attractive class. They had a generous centre of glowing blooms of Betty Uprichard and pillars of *Madame Butterfly*, *Los Angeles*, *Mrs. Henry Morse* and *Margaret Dickson Hamill*. Their other varieties included *Shot Silk*, *Lord Charlemont* and *Mrs. George Norwood*, of very good quality. Mr. ELISHA J. HICKS was third, and he had splendid blooms of *Lady Inchiquin*, *Mabel Morse*, *Mrs. Henry Stevens* and *Betty Uprichard*; Mr. J. H. PEMBERTON was fourth, and an attractive display was also arranged by Messrs. DOWTRY'S ROSERY.

There were no fewer than eleven groups of cut Roses arranged on tabling set against the walls of the hall, and these were all of considerable excellence. Messrs. CHAPLIN BROS. were first with generously filled baskets of *Emma Wright* and *Mrs. Henry Bowles*, pillars of *Lady Inchiquin* and *Mrs. Henry Bowles*, and a lovely centre of *Etoile d'Hollande*.

Mr. GEORGE PRINCE was a good second, and he staged *K. of K.*, *Hortulanus Budde*, *Angele Pernet*, *I. Zingari*, *Mrs. Henry Morse* and *Lady Roundway* in splendid condition. The third prize was awarded to Messrs. R. HARKNESS AND Co., who had arches of *K. of K.*, *Mabel Morse*, and *Mrs. Henry Morse*. Mr. ERNEST HICKS, who was fourth, staged good blooms of *Lady Inchiquin*, *Padre*, *Golden Emblem* and *Frau Karl Druschki*.

The twenty-four exhibition blooms which won the first prize for Messrs. FRANK CANT AND Co. was an excellent exhibit composed of fresh shapely blooms of good size and colour, and showing surprisingly few signs of the recent inclement weather. The principal varieties were *Mrs. G. Marriott*, *Mildred Grant*, *Mrs. G. Norwood*, *Courage*, *Gladys Holland* and *George Dickson*. Messrs. D. PRIOR AND SON were second, and they had good specimens of *J. G. Glassford*, *Marcia Stanhope*, *Augustus Hartmann* and *George Dickson*.

The amateurs also staged admirable Roses. Although there were only two exhibits of twelve exhibition varieties they were of great merit: *W. E. MOORE, Esq.*, *Ickenham*, was first with fresh and shapely examples of *George Dickson*, *Red Star*, *Mrs. Henry Bowles*, *Mrs. C. Lamp-*

lough and other good sorts. In his second prize collection, *H. ROBINS, Esq.*, *Margretting*, had fine blooms of *Mrs. Herbert Nash*, *Frau Karl Druschki* and *Lady Inchiquin*. *L. P. ROBERTS, Esq.*, was an easy first with six distinct exhibition varieties, and he included *George Dickson*, *Mr. George Lamplough* and *Madame Jules Gravereaux* of great merit. The Roses shown in vases also made a good display. *H. ROBINS, Esq.*, won a first prize with beautiful vases of *Arthur Cook*, *Lady Helen Maglona* and *Los Angeles*. *W. E. MOORE, Esq.*, was a good second and he showed *Betty Uprichard*, *Marcia Stanhope* and *Shot Silk* in his collection.

The artistic classes were well contested. In the open classes, Messrs. CHAPLIN BROS. were first, and Mr. GEORGE PRINCE was second with well arranged bowls of mixed Roses. In the amateurs' class there were six exhibits of bowls of mixed Roses, and the best was arranged by *Mrs. OAKLEY-FISHER, Sudbury, Middlesex*, while *Miss E. GRIFFITH, Finchley*, was a good second.

WOLVERHAMPTON FLORAL FETE.

(Concluded from p. 57.)

THE following awards were made to non-competitive and other displays at Wolverhampton on July 12:—

Challenge Cup, for the best non-competitive exhibit, to Messrs. JAMES CARTER AND Co., Raynes Park.

Silver Cup, for best display of hardy flowers, to Messrs. BEES, LTD., Liverpool.

Blackmore and Langdon Cup, for Begonias, to Major S. J. THOMPSON, Codsall.

Large Gold Medals—To Messrs. JAMES CARTER AND Co.; to Messrs. WEBB AND SONS, Stourbridge, for vegetables, fruits and flowers; to Messrs. BAKERS, LTD., Wolverhampton, for formal and hardy flower garden.

Gold Medals.—To Messrs. W. H. SIMPSON AND SON, Birmingham; to Messrs. ALEX. DICKSON AND SON, Newtownards, Co. Down; to the PARKS AND BATHS COMMITTEE OF WOLVERHAMPTON and to Messrs. BAKERS, LTD.,

Silver-Gilt Medal.—To Messrs. JOHN FORBES, LTD., Hawick.

Silver Medals.—To Messrs. HEWITT AND Co., Birmingham; to Messrs. MAXWELL AND BEALE, Broadstone; to Messrs. BOWELL AND SKARRATT, Cheltenham; to Mr. H. N. ELLISON, West Bromwich; to Messrs. ISAAC HOUSE AND SON, Bristol; to Mr. H. WOOLMAN, Shirley, Birmingham; to Messrs. JARMAN AND Co., Chard; and to Messrs. BAKERS, LTD., Codsall.

ROYAL SHOW, NEWPORT.

THE horticultural section of the Royal Agricultural Society's Show at Newport was again a great success. Owing to the unfavourable weather a few exhibitors were unable to compete, but two very large tents were well filled with exhibits of fine quality. The weather on the first day (July 5) could not have been worse, but even this did not deter a large number from visiting this popular show.

Groups of miscellaneous plants in and out of bloom were again excellent.

Messrs. JAS. CYPHER AND SONS, Cheltenham, won the first prize of £45 with an excellent and lightly arranged group. The second prize of £40 was won by Mr. W. A. HOLMES, Chesterfield.

The first prize in the class for twenty-four bunches of *Gladiolus primulinus* was won by Messrs. WM. ARTINDALE AND SON, Sheffield, the only exhibitors, with a good variety of well-grown flowers.

Messrs. BEES, LTD., excelled in the class for a collection of *Delphiniums* in a space of 150 square feet with a very fine exhibit.

Messrs. BLACKMORE AND LANGDON were the only exhibitors in Class 4 and were awarded the first prize.

The best group of aquatic plants was shown by Messrs. WATERER, SONS AND CRISP, and Messrs.

BOWELL AND SKARRATT, Cheltenham, were second.

Four collections of hardy perennial plants and cut flowers were staged; Messrs. BEES won the first prize of £30 with a well finished and superb group of brilliant colouring; Messrs. WM. ARTINDALE AND SON followed closely, and Messrs. M. PRICHARD AND SONS were third. The best representation of a border of hardy perennials, consisting entirely of growing plants staged on the ground was shown by Messrs. H. AND W. EVANS, Cardiff. Messrs. WM. ARTINDALE AND SON were placed second.

Messrs. C. ENGELMANN, LTD., excelled in the class for Carnations with fine quality flowers in great variety. The best border Carnations were exhibited by Mr. H. LAKEMAN, Thornton Heath.

Collections of cut Roses on a space twenty feet by five feet were fine, and included many good varieties of recent introduction. Messrs. WATERER, SONS AND CRISP were placed first and Mr. W. ROBINSON second.

Trade exhibits were again a fine feature of the show.

Large Gold Medals were awarded to Messrs. SUTTON AND SONS, for Sweet Peas; to The KING'S ACRE NURSERIES, for fruit trees in pots; to Messrs. ALEX. DICKSON AND SONS, for Roses; to Messrs. ALLWOOD BROS., for Carnations; to Messrs. EDWARD WEBB AND SONS for a miscellaneous group; to Messrs. BLACKMORE AND LANGDON, for Delphiniums; and to Mr. H. LAKEMAN, for border Carnations.

Gold Medals were awarded to STUDLEY CASTLE, for a collection of choice fruits; to Messrs. J. CARTER AND Co., for a collection of plants; to Mr. L. R. RUSSELL, for stove and greenhouse plants; to Messrs. J. PEED AND SON, for a collection of plants; to Messrs. R. AND H. CUTHBERT, for Hydrangeas; to Messrs. W. TRESEDER AND SONS, for plants and cut flowers; and to Messrs. JOHN BASHAM AND SONS, for Roses and Cherries in pots.

Awards of Silver-gilt and Silver Medals were made to other trade exhibits.

ELSTREE AND DISTRICT.

JULY 16.—The annual summer exhibition of this well-known Society was again held in the beautiful grounds of Aldenham House, Elstree, Herts., by the kind permission of Lord Aldenham and the Hon. Vicary Gibbs, when the high quality of the exhibits of previous years was not only well maintained, but even surpassed.

The display of vegetables set up by the Hon. VICARY GIBBS (gr. Mr. Edwin Beckett) was on very similar lines to that seen at the recent Chelsea show. In the present instance, however, the display was infinitely superior to that fine effort, and probably the finest ever made from this well-known garden. There were about two hundred dishes in the display. Some of the more noteworthy kinds and varieties were Red Elephant, Early Market, Short Horn and Golden Ball Carrots; Early Midlothian and King Edward VII Potatoes; All Heart Cabbage, Early Giant Pea, Round-leaved Lettuce, Fore-runner Cauliflower, Green Leviathan Broad Bean, Selected White and Ideal Cucumbers, All Seasons and Epicure Vegetable Marrow. It was a really wonderful display and well merited the award of a Large Gold Medal, a Silver Cup for the gardener, and congratulations of the judges.

The chief class for Roses was for a table group of cut blooms, arranged to occupy a space twelve feet by four feet. Of the four competitors, all of whom showed in splendid form, Messrs. W. CHAPLIN BROS., LTD., were awarded first prize, and well merited this distinction, winning outright the Challenge Cup, having won the first prize in this class for three years consecutively. It was one of the best exhibits ever staged by the well-known firm. All the best of the more recently introduced Roses were shown, and they were set up in a manner that left nothing to be desired. Messrs. R. HARKNESS AND Co. were placed second, and Messrs. FRANK CANT AND Co., third, all showing grandly.

In the class for six vases of garden or decorative Roses, in six distinct varieties, there were

five excellent exhibits. Leading honours were won by J. N. HART, Esq. (Mr. A. J. Smith), Lochinver, Little Heath, Potters Bar, who showed good bunches of Blush Rambler, Excelsa, Lady Gay, Penelope, Madame Leon Pain and Ophelia. A capital exhibit secured second prize for H. R. DARLINGTON, Esq. (gr. Mr. J. Coleman), Park House, Potters Bar, and with another good lot G. F. L. COOK, Esq. (gr. Mr. Elsworth), The Bell House, Hayes, Middlesex, was placed third.

For a dozen distinct Roses, there were four entrants. First prize was won by Mr. J. N. HART, who now wins the Challenge Cup outright. He had choice, even blooms, and well deserved premier honours. His best blooms were of Capt. Kilbee Stuart, Mrs. Elisha Hicks, Edel, George Dickson, Lord Allenby, Bessie Chaplin, St. Helena, Dr. Petyt, Mrs. C. Lampough and Mrs. R. D. McClure. Second prize was awarded to Mr. H. SPICER, Hitchin Hill, Hitchin, who had large, unfinished blooms, while an even lot of smaller flowers secured third prize for W. MARTINEAU, Esq., The Chestnuts, Boxmoor (gr. Mr. C. Ball).

Table decorations are always interesting at this show. In one class for a table decoration of Roses, first prize was won by Miss R. J. STEVENS, Cobden Hill, Radlett, who had a dainty arrangement of blush Roses, simply set up. Second prize was won by C. E. GABAIN, Esq. (gr. Mr. J. A. Paice), Mill Hill, with Lady Gay, and third prize was won by Miss E. HARDING, Round Bush, Aldenham, with Excelsa. In another class from which Roses were apparently excluded, first prize was awarded to a very pretty combination of pink Cornflowers, pale blue Scabious and Veronica spicata rosea, the winner being Mrs. G. ATTENBOROUGH, High Cross, Aldenham. Another charming decoration secured second prize for Mrs. T. E. EAMES, Elstree, who had a similar scheme of colours, using a pink Carnation, blue Scabious and a Heuchera. Third prize was awarded to Mrs. F. E. TUTTLE, Bushey.

Sweet Peas are always shown well at Elstree. In the class for twelve bunches, distinct, a grand series secured first prize for G. S. LEGGATT, Esq. (gr. Mr. E. J. Pratt), Harpenden, who staged Mammoth, Powerscourt, Charming, Orion, What Joy, Sybil Henshaw, Royal Mauve, Royal Sovereign, Jean Ireland, Olympia and Magnet, in splendid form. Second prize was secured by J. WALBROOK, Esq., The Croft, Stanmore (gr. Mr. W. H. Holloway). For six vases, distinct, Mr. G. L. F. COOK was first with grand flowers, and with another good exhibit, H. DUNHILL, Esq. (gr. Mr. B. Howard), Mount Lodge, Harpenden, was placed second.

There were large numbers of honorary exhibits which added materially to the beauty of the show. Gold Medals were awarded to J. WALBROOK, Esq., for a large group of Fancy Pelargoniums; Messrs. W. CUTBUSH AND SON, LTD., Barnet, for Roses, herbaceous flowers and alpine plants; Mr. J. C. ALLGROVE, Langley, Slough, for a large collection of Gooseberries; and to Messrs. WOOD AND INGRAM for Roses.

ROYAL SCOTTISH ARBORICULTURAL.

ABERDEEN BRANCH.

A DELIGHTFUL and instructive afternoon was spent on Saturday, the 18th ult., by the members of this Branch, among the woods on the beautiful estate of Pitfour, Aberdeenshire. It is one of the saddest sights to-day in driving through the countryside to see so many fine old mansion houses and estates broken up and sold. The Pitfour estate is one of the latest to come under this fate. Messrs. John Bisset and Sons, Ltd., timber merchants, Aberdeen, have purchased the mansion house and the matured timber. The latter occupies an area of some 500 acres, consisting of Scots Fir, Spruce, Beech and various other kinds of hardwood trees. The stipulation of the bargain is that the ground must be cleared by five-and-a-half years from now, when it will be taken over by the Forestry Commission for the planting of commercial timber.

The visit was made on the invitation of

Messrs. Bisset, and the party was met by Mr. John Bisset and his three sons, John, James and Reginald, who conducted the party. Much interest was evinced in the wonderful devices used for the expeditious clearance of the trees. Directly these are felled they are cut into lengths and conveyed by light railway to the saw-mills, where they are slabbed, edged and jointed. A visit was then made to the sawmills, the plant of which aroused considerable interest. The power fuel used is sawdust, and the ingenious manner in which this is drawn by suction from the saws to the boiler evoked much praise. At this point lunch was provided for the company. Then followed the quarterly meeting of the Branch. Mr. John Michie, M.V.O., the President of the Branch, occupied the chair. He made sympathetic reference to the loss sustained by Col. W. S. Fotheringham, Murthly Castle, Perthshire, a prominent member of the Society, in the death of his wife, and Mr. Charles S. France, Aberdeen, spoke of the recent death of Mr. James Ward, forester and land steward, Seafeld Estates, Keith, a member of the Branch. It was agreed to send a message of sympathy to Mr. Ward's relatives. The Chairman intimated that Colonel Ogston, of Kildrummy, had invited the members to visit Kildrummy on September 17. Six new members were elected.

A visit was paid to the stone circle on the estate, which is believed to be a relic of the ancient Druids. A return was made to the mansion house of Pitfour, now, alas, being demolished, where the visitors were entertained to tea by Messrs. Bisset.

GUILDFORD AND DISTRICT GARDENERS'.

THE fifth annual show of the Guildford and District Gardeners' Association took place in the beautiful and spacious grounds of Stoke Park on July 13, and was undoubtedly the best show that this young and virile Association has held. Not only was there a greatly increased number of entries, constituting a record of 1,440, but the general quality of the produce was highly satisfactory, Carnations, Roses, Sweet Peas, herbaceous perennials and vegetables of a high standard of excellence being staged. Table decorations were also a feature of the show and attracted a very large number of entries.

In the competitive classes, the Silver Cup for Carnations was won by Sir JOHN LEIGH with excellent flowers of Lady Inverforth, Winter Glow, Baroness de Brien, Lord Lambourne, White Pearl and Triumph. The Mayoress's Silver Cup and National Sweet Pea Society's Silver Medal for Sweet Peas, was awarded to F. W. FRANKS, Esq., for flowers of outstanding merit; and the Silver Cup for Roses was won by W. HARVEY, Esq., with a superb group of clean, well-grown flowers.

Exhibits in the non-competitive classes were extensive, and the Gold Medal of the Association was awarded to the GODALMING NURSERY Co., for a very fine and tastefully arranged collection of herbaceous perennials, foliage plants and Hydrangeas. A Gold Medal was also awarded to Messrs. FOGWILLS for a collection of vegetables comprising about 150 dishes of seasonable varieties shown in excellent condition. The Silver Medal of the Association was awarded to Messrs. SKELTON AND KIRBY for a collection of herbaceous perennials and rock plants; to Messrs. SPOONER AND SONS for a group of foliage plants, flowers and floral designs; and to Messrs. SCOTT AND WICKHAM for a group of Carnations.

The Silver-Gilt Medal presented by *The Gardeners' Chronicle* for the most meritorious exhibit entered not for competition, was won by Mrs. FARNHAM, The Heights, Witley, with an exceptionally fine and well-grown collection of Sweet Peas.

Other meritorious non-competitive exhibits included Caladiums, Gloxinias and Streptocarpus, from Messrs. J. PEED AND SON; herbaceous perennials and Roses from Messrs. JACKMAN AND SON; Sweet Peas from Messrs. BIDE AND SON; Hydrangeas and Roses from Messrs. WILLIAM CUTBUSH AND SON; Carnations from Messrs.

ALLWOOD BROS.; water garden and herbaceous plants from Mr. HOWARD; herbaceous perennials and Roses from THE CHALK HILL NURSERIES; herbaceous perennials, Roses and Dahlias from Messrs. J. CHEAL AND SON; Roses and Carnations from Mr. DENYER; and a group of foliage and flowering plants, including well flowered examples of *Vanda coerulea* and *Phalaenopsis Rimestadiana* from J. J. JOICEY, Esq.

ROYAL HORTICULTURAL.

JULY 19.—Although there were several distinct shows held at the R.H.S. Hall, Westminster, on this date, there were still empty spaces. The R.H.S. had a special competitive show of Cherries and soft fruits. Gooseberries were the principal feature, and Mr. J. C. ALLGROVE was awarded a Gold Medal for a splendid collection of this fruit, which he showed as fruiting bushes in pots and as gathered fruits. The National Carnation and Picotee Society held its annual show in conjunction with the meeting and the London and South of England Viola and Pansy Society held their first annual show. Orchids were fewer than usual, but seasonable hardy flowers were freely shown. Section B. of the Floral Committee made a large number of awards, chiefly to old flowering shrubs.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Sec.), Mr. Stuart Low, Mr. T. Armstrong, Mr. J. Cowan, Mr. A. McBean, Mr. Charles H. Curtis, Mr. H. G. Alexander, Mr. A. Dye, Mr. E. A. Ashton, Mr. J. Wilson Potter, Mr. Fred. J. Hanbury and Mr. C. J. Lucas.

The Orchid Committee had little work to do as few individual plants and only one group were exhibited.

AWARD OF MERIT.

Disa Italia var. *Pink Domino*.—A beautiful *Disa* derived from *D. Blackii* crossed with *D. grandiflora*. It was described in our issue of July 2, when it was the best new garden plant exhibited at the Amateur Show. The plant is of fine, sturdy habit, having spikes a yard high and carrying four or five large pink and rose-pink flowers. On June 8, 1918, Messrs. Black and Flory exhibited *Disa Italia* derived from the same parents but, apparently, the reverse cross, therefore *Pink Domino* becomes a variety of *Italia*. The hybrid is interesting seeing that *D. Blackii* is derived from *D. grandiflora* and *D. Luna*, and *D. Luna* is the result of crossing of *D. racemosa* and *D. Veitchii*. *Pink Domino* is figured on p. 67, and was shown on Tuesday last by Col. STEPHENSON CLARKE (gr. Mr. Conn), Borde Hill, Sussex.

OTHER EXHIBITS.

The only group of Orchids on this occasion was a bright and pleasing exhibit from Messrs. CHARLESWORTH AND CO., Haywards Heath. This firm displayed fine examples of *Miltonia Lycaena*, *M. Greta* (*Charlesworthii* × *William Pitt*), *M. Blushing Bride*, *M. Princess Mary*, *Odontoglossum Ascania* var. *leucoglossa*, *O. Sterlina*, *O. eximium xanthotes*, *Cattleya Warscewiczii* var. *Mrs. Ashworth*, with white flowers; *Cypripedium Massianum*, *C. Alma Gavaert* (*Lawrencianum Hyeum* × *Maudiae*), the bright-flowered *Odontodia Mauveen*, and the rich purple *Sophro-Laelio-Cattleya Adonis*; the last-named derived from *S.-L.-C. Anzac* and *Cattleya Warneri Ardenholme* var. Messrs. H. G. ALEXANDER showed fine plants and flowers of *Laelio-Cattleya Lustrissima superba* and *Cattleya Hesperus*, the latter having a handsome purple and gold lip.

Floral Committee.

Present: Section A.—Mr. J. F. McLeod (in the chair), Mr. Arthur Turner, Lady Beatrix Stanley, Mrs. Helen Lindsay Smith, Mr. Wm. Howe, Mr. D. Ingamells, Mr. M. C. Allwood, Mr. A. E. Vasey, Mr. E. R. Janes, Mr. James B. Riding, Mr. R. Findlay, Mr. W. B. Gingell, Mr. D. B. Crane, Mr. Charles E. Pearson,

Mr. G. W. Leak and Mr. W. D. Cartwright, Secretary.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. W. G. Baker, Mr. W. J. Bean, Mr. Charles T. Musgrave, Mr. James Hudson, Mr. G. Reuthe, Mr. E. H. Wilding, Mr. Reginald Cory, Mr. E. A. Bowles, Mr. A. Bedford, Mr. L. R. Russell, Mr. T. Hay, Mr. C. Williams, Mr. F. G. Preston, Sir William Lawrence, Bt., Mr. R. C. Notcutt, Mr. C. J. Lucas, Mr. Amos Perry, Mr. G. Yeld, the Hon. Henry McLaren and Mr. N. K. Gould, Secretary.

FIRST CLASS CERTIFICATE.

Clethra Delavayi.—This is an exceedingly handsome species of robust habit. The stems of the young shoots and the flower stalks are red. The broadly lanceolate leaves are undulated on their upper surfaces, dark green above and glaucous beneath. The round, white flowers, which are large for the genus, are densely set on terminal racemes, which are fully six inches in length. Shown by GERALD W. E. LODER, Esq., Wakehurst Place, Ardingley, Sussex.

AWARDS OF MERIT.

Carmichaelia Australis.—A half-hardy shrub which was introduced from New Zealand over a hundred years ago. Exceedingly well-flowered branches were shown, and these bore quantities of the small lilac-coloured flowers in simple racemes. Shown by GERALD W. E. LODER, Esq.

Feijoa Sellowiana.—A well fruited branch of this Brazilian shrub was shown. The illustration in *The Gardeners' Chronicle* of December 24, 1898, depicts the flowers and fruit. It is a Myrtaceous shrub, with thick, leathery leaves, and the fleshy petals are fawn-coloured without and purplish-crimson within. As the flowers expand, the petals fold back, disclosing their bright colour and handsome clusters of stamens. Shown by INGRAM WHITAKER, Esq., Pylewell Park, Lymington.

Gaultheria ? Farrer 1,191.—There appears to be some doubt as to the genus of this uncommon little evergreen shrub. It is of spreading habit, and the wiry shoots are furnished with small, ovate, alternate leaves which are lightly toothed, shining green above and sage-green below. The solitary flowers, which are produced in the axils of the leaves, have the superficial appearance of blue berries, not unlike the fruits of a *Pernettya*. The fleshy, blue calyx encloses the relatively small, green calyx and organs. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Southampton.

Hymenocallis speciosa.—This very old stove liliaceous plant was introduced from the West Indies in 1759, and formerly was largely grown in our glasshouses. It is illustrated in tab. 1,453 of the *Bot. Mag.* as *Pancratium speciosum*. Two large scapes of pure white fragrant flowers were shown by Sir WILLIAM LAWRENCE, Bt., Burford, Dorking.

Lobelia Tupa.—This vigorous, half-hardy perennial was introduced from Chili in 1824. A good illustration of a flower spike and leaf appears in *Bot. Mag.*, tab. 2,550, and its habit is well portrayed in the illustration which appeared in *The Gardeners' Chronicle* of September 28, 1912. Under generous treatment, the plant becomes seven or eight or even more feet in height, and bears large, ovate, downy leaves and robust spikes of reddish flowers. Shown by GERALD W. E. LODER, Esq.

Lomatia ferruginea.—Plants of this Chilean evergreen shrub are frequently shown in collections at the R.H.S. meetings. It was introduced in 1851. *The Gardeners' Chronicle* of September 28, 1907, contains illustrations which include interesting drawings of the details of the flowers. On the present specimens the flowers are less hidden by the foliage than usual. The short racemes have curiously formed flowers which are buff-coloured on the outsides and bright scarlet within. Shown by H. ARMYTAGE MOORE, Esq., Knowallane, Saintfield, Co. Down.

Maranta Porteana variegata.—The chief beauty of this tropical, herbaceous perennial lies in the rich purplish colouring on the undersides of

the variegated leaves. It is a sport from *M. Porteana*. Shown by Messrs. L. R. RUSSELL, LTD.

Mitraria coccinea.—This is quite a common shrub in the gardens of the warmer parts of the country. In one Cornish garden we have seen it grown as a hedge, and it was exceedingly beautiful when in flower. So long ago as 1849, Messrs. ROBERT VEITCH AND SON, of Exeter, caused a mild sensation by exhibiting a plant before the Chiswick Horticultural Society. The leaves are small, of delicate green colour, and the bright scarlet, tubular flowers have long stalks. It is illustrated in *Bot. Mag.*, tab. 4,462. Shown by GERALD W. E. LODER, Esq.

Sabbatia campestris.—This hardy annual was introduced from North America in 1855. The illustration in *Bot. Mag.*, tab. 5,015, gives a good impression of the flowers and habits of the plant, but Mr. HAY's flowers are of a distinctly brighter shade of pink, and the yellow zone is clearer. It appears to be a comparatively rare plant even in its native Arkansas, and the Red River, where it inhabits the open prairies, spangling them with its star-shaped flowers. It was illustrated in *Gard. Chron.*, August 7, 1926. Shown by Mr. T. HAY.

Tecoma jasminoides ?—The award is subject to verification of name. The plant shown does not agree with Bailey's description of *Tecoma jasminoides* in the *Queensland Flora*, where he states that the flowers are white, streaked with red in the throat, whereas those shown were stippled with pink and had hairy crimson throats. It had more the appearance of a *Thunbergia* than a *Tecoma*. Shown by Lt.-Col. MESSEL, Nymans, Haywards Heath.

GROUPS.

On a considerable floor space, Mr. H. J. JONES set out an admirable collection of herbaceous Phlox. His chief varieties were *Mrs. Scholton*, bright salmon; *Mrs. Askew*, deep salmon; *Asia*, lilac, with a carmine eye; *F. A. Buckner*, white; *E. Campbell*, pink with a paler centre; *Imperator*, crimson, and *Royal Purple*. Messrs. B. LADHAMS, LTD., included Phloxes with *Coreopsis*, *Gaillardias*, *Hydrangeas* and *Lavateras* in a large exhibit of hardy flowers.

An interesting exhibit of Poppies was made by Messrs. SUTTON AND SONS. Amongst the vigorous double-flowered varieties they showed *Cardinal*, *Pink Gem* and *Salmon Pink*. The Shirley Poppies were represented by good colours, and there were also several showy varieties of *Eschscholtzias*. Messrs. BAKERS, LTD. staged *Delphiniums*, *Lychnis viscaria* fl. pl., and *Lupins*.

In the corner of the Orchid Annexe, Mr. H. HEMSLEY had a good collection of his hybrid *Sidalceas*. Mr. RICH showed Phloxes *Le Mahdi*, *Madame Scholer* and *H. T. Leiter*, with *Gaillardias* and other border flowers. Mr. F. G. WOOD had a well-arranged exhibit in which he displayed *Primulas*, *Funkias*, *Astilbes*, and shrubby *Veronicas*.

An extensive collection set up by Messrs. WATERER, SONS AND CRISP included several *Liliums*, herbaceous Phlox, *Monardas*, *Primula Florindae* and many alpine. A goodly batch of *Linaria Canon J. Went*, a graceful blush pink variety, was shown by Messrs. BOWELL AND SKARRATT. Mr. G. REUTHE had his customary exhibit of uncommon shrubs and alpine and included *Lonicera Hildebrandtii*, *Lilium dalmaticum* and various alpine.

Messrs. ROBERT VEITCH AND SON contributed many interesting shrubs, such as *Romneya tricocalyx*, *R. hybrida*, *Lonicera Hildebrandtii*, the woolly-leaved form of *Plagianthus Lyallii* and *Escallonia Iveyi*. Messrs. M. PRICHARD AND SON staged *Mesembryanthemums*, *Sedums*, dwarf *Campanulas* and *Astilbes*.

A graceful and interesting group of *Dracaenas* of various kinds was made by Messrs. L. R. RUSSELL, LTD. They included *D. Victoria*, *D. Sanderiana*, *D. Goldiana*, *D. Lord Wolseley*, with brilliantly coloured leaves, and *Cordyline indivisa Albertii* and *C. i. Doucettii*.

Greenhouse Carnations were shown by Messrs. C. ENGELMANN, LTD., Messrs. ALLWOOD BROS., and Messrs. STUART LOW AND CO. The last-named also had a small collection of greenhouse

plants including Oleanders and Tremandra verticillata. Mr. CHARLES WALL had several new Carnations of which Glorious, rosy-cerise, and Dixie, a yellow fancy, were very attractive. Border Carnations were shown by Messrs. LOWE AND GIBSON and by Messrs. SEYMOUR AND ANDERSON. A good collection of Roses was staged by Mr. J. H. PEMBERTON, while the BURBAGE NURSERIES had several novelties.

Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (in the chair), Mr. H. S. Rivers, Mr. J. Cheal, Mr. P. C. N. Veitch, Mr. A. H. Pearson, Mr. A. Bullock, Mr. J. Wilson, Mr. P. D. Tuckett, Mr. H. Prince, Mr. W. Giles, Mr. F. Jordan, Mr. J. C. Allgrove, Mr. H. Markham, Mr. George F. Tinley, Mr. W. H. Divers and Mr. A. N. Rawes (Secretary).

Several new fruits were submitted for award. The best was a Raspberry named Exeter Yellow, shown by Messrs. R. VEITCH AND SON, Exeter; it originated as a chance seedling in the firm's nursery. The fruits are exceptionally large and good-flavoured. It was recommended that the variety be included in the trial of Raspberries at Wisley.

Mr. J. J. KETTLE also exhibited his new apricot-coloured Raspberry named Lord Lambourne.

Sir JOSEPH TICHBOURNE, Bt., Tichbourne Park, Alresford, Hampshire (gr. Mr. C. Goodchild), showed some exceptionally fine fruits of Aubergine Goodchild's Selected. They are of the New York Purple type, but said to be a little firmer in the centre. They were exceptionally fine specimens, and a Cultural Commendation was awarded to Mr. GOODCHILD.

Messrs. SUTTON AND SONS showed some interesting Peas and Beans, including purple-fruited Broad Beans of the Windsor and Long-podded type; golden-podded Beans with white beans, yellow-podded Peas; purple-podded Peas; the Mummy Pea crossed with a variety having no tendrils, in which the progeny had pods at the top of the shoots in clusters, but with Acacia-like foliage without tendrils; Sugar Peas of the large-podded type, and the wild Pisum humile, with pods about one-and-a-half inch long.

Mr. J. C. ALLGROVE showed a grand exhibit of Gooseberries and Currants very attractively arranged in baskets of various sizes, and with cordon and bush trees in pots at the back, the latter having exceptionally heavy crops. The Gooseberries included about sixty varieties, of which the largest berried were Broom Girl, Speedwell, Leveller, of which a magnificent bush was also shown; Pilot, Conquering Hero, Succeed, and Surprise. Early Sulphur, which is the earliest Gooseberry to ripen, was included in the collection, also Green London, Yellow Warrington, Pitmaston Gage, Dan's Mistake and the almost black Ironmonger, with fruits as round as a black Grape and about the same size. A selection of half-a-dozen of the finest flavoured varieties is Langley Gage, Ironmonger, Langley Beauty, Whitesmith, Keen's Seedling and Warrington.

Messrs. LAXTON BROS. exhibited several soft fruits, including many new Black Currants, Red Currants, Raspberries and Gooseberries raised by them. Laxton's No. 1 Red Currant is one of the best sorts in cultivation and said to be superior even to Perfection. They showed new Black Currants in Black Grape and Tinker, and a new Gooseberry named Bedford Red, like Whinham's Industry, but of more upright growth and a freer cropper.

Mr. H. HEMSLEY showed a representative collection of Currants, Gooseberries, Raspberries and Loganberries. The Gooseberries were exceptionally good and included excellent fruits of Careless, Lancashire Lad, White Campaign, Whinham's Industry, Keepsake, Whitesmith, Howard's Lancer and White Lion. They also had fine dishes of White Versailles White Currants.

Messrs. RIVERS AND SON exhibited some exceptionally fine Cherries in small boxes, of the varieties Monstreuse de Mezel, White Bigarreau, Turkey Black Heart, Ursula Rivers, Emperor Francis, Napoleon Bigarreau, Noir de Schmidt, Late Black Bigarreau, Bohemian Black Bigarreau, Bigarreau Noir de Guben, May Duke and Géant d'Hedelfingen.

CHERRY AND SOFT FRUITS COMPETITION.

A competition, open only to amateurs, for Cherries and soft fruits, attracted a fair amount of interest. The schedule comprised twenty classes for Cherries, Gooseberries, Black Currants, Red Currants, White Currants, Raspberries, Figs, Loganberries and other Rubi.

Only one exhibit was staged in the class for a collection of Cherries in not fewer than six varieties. The exhibitor was Sir CHARLES NALL-CAIN (gr. Mr. T. Pateman), Brocket Hall, Hatfield, and he was awarded the first prize for finefruits of Frogmore Early, Black Tartarian, Bedford Prolific, Bigarreau de Schrecken, Black Knight, Florence, May Duke, White Heart and Elton. In the class for three varieties of Cherries, F. C. STOOPE, Esq. (gr. Mr. G. Carpenter), West Hall, Byfleet, was awarded the first prize for White Heart, Morello and Archduke. This exhibitor was also first in the class for a collection of Gooseberries in not fewer than nine varieties. His finest sorts were Trumpeter, Matchless, Colossal, Fearless, London City, Leveller, Speedwell, Lancer and Broom Girl; second, Sir CHARLES NALL-CAIN with especially good fruits of Langley Beauty, Leveller and Keepsake.

The best dish of a red Gooseberry was Lancashire Lad, shown by Mr. W. J. ABREY, Tonbridge, and the best of a yellow variety, Leveller, shown by Mr. H. COLEMAN, Watford; second, Careless, shown by Mr. A. G. ROBshaw, Golders Green. The best dish of a green or white variety of Gooseberry was Lancer, shown by Mr. W. J. ABREY; second, Mr. COLEMAN, with Shiner.

The finest Black Currants were shown by Mr. R. STAWARD, Ware Park Gardens, Ware, who had good bunches of Blacksmith, The Tinker and Raven; second, F. C. STOOPE, Esq., with Bladwin, Boskoop Giant and Seabrook's Black. The best single dish of Black Currants was Boskoop Giant, shown by Mr. C. PERCIVAL MAW, Merstham; second, Mrs. PRIESTLEY, Orpington, with the same variety.

Mr. STOOPE excelled in the class for three varieties of Red Currants with Laxton's Perfection, Southwell Red and Cherry Currant, and much the finest Red Currant in the single dish class was Littlecroft Beauty, shown by Mrs. PRIESTLEY; second, Perfection, shown by Mr. STAWARD.

Mr. STOOPE, with White Versailles, excelled in the class for White Currants. This exhibitor had the best three varieties of Raspberries in Red Cross, Pyne's Royal, and Laxton's Bountiful. Mr. STAWARD was easily first in the class for one dish of Raspberries with a seedling; second, Pyne's Royal, shown by Mr. R. COLLARD, Shenfield. The best Loganberries were shown by Mr. J. E. ANSTEE, Sutton.

Two competed in the class for a collection of fruits, in which Sir CHARLES NALL-CAIN was first with Brown Turkey Figs, Florence Black Currants, Bigarreau Napoleon Cherries, Laxton's A.1. Red Currants, Gooseberries, Pyne's Royal Raspberries and others; second, Mr. STOOPE.

Awards to Bearded Irises.

THE collection of bearded Irises which have been under trial at Wisley for several years have been judged, and the following awards made, by the Royal Horticultural Society on the report of the Joint Committee of the Royal Horticultural Society and the Iris Society.

Many varieties in the trial are still awaiting judgment, and the following is to be regarded as a preliminary list.

AWARDS OF MERIT.

White, or nearly White Varieties.—*Istria*, a collected form from Mr. W. R. Dykes, sent by THE ORPINGTON NURSERIES, Kent. *White Knight*, raised by Mr. Saunders, and sent by THE ORPINGTON NURSERIES, Kent. *Mystic*, sent by THE ORPINGTON NURSERIES, Kent.

White Standards, Coloured Falls.—*Rhein Nixe*, raised by Messrs. Goos and Koenemann, sent by Messrs. BARR AND SONS, Mr. AMOS PERRY, and Messrs. WATERER, SONS AND CRISP.

Purple Bicolors.—*Lord of June*, raised by Mr. G. Yeld, sent by Messrs. LOWE AND GIBSON. *Leonato*, raised by Sir Arthur Hort, sent by Messrs. R. WALLACE AND CO. *Souvenir de Madame Gaudichau*, raised by Messrs. Millet, sent by Messrs. R. WALLACE AND CO. *Titan*, raised by Mr. A. J. Bliss, sent by P. L. PILKINGTON, Esq. *Imperator*, raised and sent by Messrs. CAYEUX AND LE CLERC. *Kharput*, sent by Messrs. BARR AND SONS and Mr. AMOS PERRY.

Purple Sells.—*Corrida*, raised by M. Millet, sent by Messrs. R. WALLACE AND CO. *Mars*, sent by Messrs. BARR AND SONS. *Kochii*, sent by Messrs. R. VEITCH AND SON, and Messrs. BARR AND SONS. *Kurdistan*, raised by Mr. W. R. Dykes, sent by Messrs. R. WALLACE AND CO.

Standards of Shot Shades.—*Mary Gibson*, raised and sent by Mr. AMOS PERRY. *Alcazar*, raised by Messrs. Andrieux-Vilmorin et Cie., sent by Messrs. WATERER, SONS AND CRISP. *Tenebrae*, sent by THE ORPINGTON NURSERIES. *Troades*, raised and sent by Mr. AMOS PERRY. *Billia*, raised and sent by Mr. AMOS PERRY. *Cardinal*, raised by Mr. A. J. Bliss and sent by Messrs. R. WALLACE AND CO. *Prosper Laugier*, raised by M. Vardier, sent by Messrs. BARR AND SONS. *Ambassadeur*, raised and sent by Messrs. VILMORIN-ANDRIEUX ET CIE.

Varieties with Yellow Standards and Coloured Falls.—*Marsh Marigold*, raised by Mr. A. J. Bliss, sent by Messrs. LOWE AND GIBSON. *Fro*, raised by Messrs. GOOS AND KOENEMANN, sent by Messrs. WATERER, SONS AND CRISP.

Yellow Varieties.—*Amber*, raised and sent by the late Mr. W. R. DYKES.

PAISLEY FLORISTS'.

ON the occasion of the annual outing of this ancient Society, the members and friends visited Dupplin Castle, Perth, the residence of Lord Forteviot, and spent an interesting day in the extensive gardens.

The flower and vegetable gardens were visited in turn, and the fruit houses were also inspected. Tea was served in the gymnasium where Lord Forteviot extended a hearty welcome to the visitors. On behalf of the company Mr. A. MacGregor thanked His Lordship for his kindness, and a similar compliment was passed to Mr. Beatty and Mr. Feeny.

ANSWERS TO CORRESPONDENTS.

CLUB ROOT IN CABBAGES.—*E. H. W.* To correct the tendency of your Cabbages to develop "Club root" any form of lime is suitable, although quick lime is the most rapid in action. Any form that may be obtained should therefore be used for the purpose. Thorough cultivation of the soil is essential to rid it of insect grubs, soot being a good deterrent. Many grubs that are found in the soil are innocuous and some are even helpful.

MAGGOTS IN SOIL.—*B. B.* The maggots are fly larvae, living principally on the great amount of organic matter in the soil. They may have been breeding in the soil used for potting various plants. If the plants are potted, it will be difficult to kill the maggots without injuring their roots, therefore, wherever possible, use soil free from maggots. To clear infected soil the most effective method is to use heat. Where this is impossible, one of the advertised soil fumigants should give good results. If a chemical soil disinfectant is used, some time must be allowed to elapse before the soil is used for potting purposes.

NAMES OF PLANT.—*E. K.* Probably *Zephyranthes carinata*. The specimen was badly damaged in transit. *J. D.* Rose Cheshunt hybrid. *J. C.* *Sparmannia africana*.

Communications Received.—*H. W.*—*S. J. T.*—*J. D. C.*—*A. B. C.*—*A. H. B.*—*Newent*—*M. L.*—*A. E. C.*—*H. T.*—*W. G.*

MARKETS.

COVENT GARDEN, Tuesday, July 19th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

Plants in Pots, etc.: Average Wholesale Prices.

REMARKS.—Practically all outdoor blooms have been rather poor in quality during the past week, including Cornflowers, Scabiosa and Gypsophila elegans. Delphiniums have also suffered owing to the heavy rains. More Gypsophila paniculata has been on sale and supplies are increasing almost daily. Carnations continue to arrive in large quantities, but Roses have been somewhat shorter in supply, especially white blooms. More Asters have been available. White and coloured Stocks have been spoiled by the heavy rains, and sound flowers have realised good prices. Good Achillea The Pearl is also rather inferior. Lilium longiflorum was a trifle firmer in price this morning. White and pink L. lancifolium are much finer in quality, and prices are the lowest so far this season. Chrysanthemum have made their first appearance this season, disbudbed blooms of white and bronze sorts have been on sale, but they are rather poor in quality and cannot be recommended. Of Gladioli, the primulinus varieties are the most plentiful, and they are very good in quality. Halley is the most plentiful of the Giant varieties, and good scarlet and white spikes are in demand. Sweet Peas have been generally poor in quality for sometime past.

REMARKS.—Business has not been good during the past week. The volume of produce handled has been heavy, but the weather has militated against freedom in buying.

At the time of writing there is a distinct improvement. Hothouse fruits, such as Grapes, Peaches, Melons, Nectarines and Figs, are selling moderately well. A few Strawberries are still available. Raspberries have been a poor market for some time now, owing to the excessive rains making the berries unsaleable, even after a few hours in the market. Black Currants are selling well, although quantities on the market are the heaviest that have been handled for some years past. It is very noticeable how popular the 4 lb. and 6 lb. chip baskets of Black Currants are; even large jam buyers on the market preferring that package to any other and paying more accordingly. Red Currants are selling well. Some very good Leveller Gooseberries are now arriving, the crop being comparatively heavy this year. A few English Apples are available, most of them probably thinnings. New Zealand Apples are still arriving and selling fairly well in spite of competition with other fruits. Abundant supplies of English Tomatoes are selling at rather low prices, but a spell of warm weather would improve the trade for both those and Cucumbers. Dutch Tomatoes are cheap and plentiful. For the time of year, forced French Beans are selling remarkably well, the outdoor crop being on the late side. Peas are variable in condition and quality. Salads are not a brisk trade and leave much room for improvement. Green vegetables are a moderate business. The Potato trade is fairly steady, with little variation in prices.

GLASGOW.

The cut flower market was quiet and featureless in the past week. Carnations continued to be plentiful and cheap at 1/4 to 1/9 per dozen, and Roses also were cheap at prices ranging from 1/- to 2/6 per dozen. Sweet Peas were worth 1/6 per large bunch. English-grown, 10d. to 1/- for 12's; Scotch-grown, 4d. to 8d. Marguerites realised 3d. to 4d. per bunch; Anemones, 10d.; Lilium longiflorum (Harrissii) 2/- to 2/3 per dozen; Gypsophila, 6d.; Gladioli, 1/4 to 1/9 (6's); and 2/- to 2/3 (12's).

As usual in the Fair holiday week, business in the fruit section was rather slow. Home-grown soft fruits were more or less affected by the weather, and the quality of Strawberries was irregular, a large proportion of the daily supplies being soft. English berries made 6d. to 9d., and Scotch, 6d. to 7d., but 1/- per lb. was paid for first-grade fruits. Prices of English Black Currants averaged 7d. to 9d. per lb. Peaches sold for 6/- per dozen; Gages, 18/- per sieve; Gooseberries, 4/- to 4/6; Red Currants, 5d. to 6d. per lb.; Royal Plums, 10/- per package; English Apples (Keswick Codlin), 3d. per lb.; Muscat Grapes, 3/6 per lb.; black Grapes, 1/6 to 2/- per lb., and Cherries, 5/- to 18/-, according to variety and quality. Scotch Tomatoes were cheaper at 5d. to 7d. per lb.; Sunkist Oranges realised 30/-, and South African seedless Oranges, 24/-; New Zealand Apples fetched 21/- per case; Naples Lemons, 21/- to 24/-; and Palermo Lemons, 16/- to 17/-.

In the vegetable section, Cucumbers realised 7/- per dozen; Lettuces, 1/6 to 2/-; Cauliflowers, 3/- to 5/-; Radishes, 3/- dozen bunches; Syboes, 8/-; Peas, 12/- per pot, and Rhubarb, 12/- per cwt.

TRADE NOTES.

MESSRS. G. H. RICHARDS, LTD., 234, Borough High Street, London, S.E.1, have purchased the goodwill and sole right to manufacture Kamforite and Compound Horticultural Manures formerly carried on by Messrs. Hensman Brothers of Horncastle. Henceforth the Kamforite preparations will be manufactured and distributed by Messrs. Richards from London.

WEEDS grow apace at all times, and especially so during such a wet, sunless period as gardeners are experiencing. The old method of hand-weeding the garden paths has, fortunately, given place to the modern method of using a weed killer. An effective weed killer, such as Eureka, manufactured by Messrs. Tomlinson and Hayward, saves much time and labour, as application is quite easy. Moreover, its use does not discolour the gravel.

ANY of our readers requiring information and advice respecting Patents, Trade Marks, or Designs, should apply to Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

GARDENING APPOINTMENT.

Mr. G. R. Pierce, for the past twelve years general foreman at Wadhurst Hall Gardens, Wadhurst, Sussex, as gardener to Sir JOHN BLUNT, Bart., Huntleigh, Tunbridge Wells, Kent. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 63°4'.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, July 27, 10 a.m. Bar. 29.7. Temp. 63°. Weather, Showery.

The Control of Glasshouse Pests. GROWERS of plants under glass, no matter how much care they take in cultivation, find, upon occasion, that their plants are attacked by White Fly, Aphis, or other insect pests. Hitherto the only thoroughly efficient method of ridding glasshouses of these unwelcome visitors has been that of cyaniding by means of sodium cyanide. Given intelligent use, this method is both effective and free from risk; but there is naturally an objection to the employment of an insecticide which requires meticulous care if all risks to the operator are to be avoided. It is therefore of importance for growers of plants under glass to know that calcium cyanide provides a simpler method of cyaniding than does sodium cyanide. This substance, as specially manufactured in the United States of America, contains forty per cent. to fifty per cent. of $\text{Ca}(\text{CN})_2$. When exposed to moist air it undergoes chemical change and

gives off hydrocyanic acid gas, the insect-killing agent. The mode of employment of calcium cyanide is simple. The right quantity of the material is placed in a covered funnel provided with a tap, and the operator as he walks through the glass-houses, allows the calcium cyanide to run out from the funnel on to the ground. He then makes a prompt exit, and locks the door behind him. Mr. H. W. Miles, entomologist to the American Cyanamid Company, has carried out a series of experiments* with calcium cyanide in this country with convincing results. He finds that White Fly is easily controlled by its use. Among plants fumigated in this way were Chrysanthemums, Azaleas, Runner Beans, Cucumbers, Freesias, Tomatos and Arums (Richardias). For young plants the strength of the application is naturally much smaller than that which is used for mature plants. So small an amount as one-twelfth of an ounce per 1,000 cubic feet was found to suffice to keep White Fly (*Trialeurodes vaporariorum*) in check. Fumigation by means of a dosage three times that strength, i.e., one quarter-ounce per 1,000 feet, may be used with impunity and with satisfactory results for Tomatos, and a rather larger dose—one-third of an ounce per 1,000 cubic feet—suffices to rid Chrysanthemums of White Fly. To ensure good results, the houses must be neither too dry nor too wet. If dry, the paths should be damped an hour or two before fumigation; if very wet, the calcium cyanide should be sprinkled on dry boards laid down on the paths of the house. Open water tanks in the house should be covered over. Needless to say, if the house is leaky, larger quantities of the insecticide must be employed, and it is also important for those who use calcium cyanide to remember that the glasshouses should be thoroughly ventilated after fumigation. Aphides of all kinds, including the common Aphis, *Myzus persicae*, appear to be easily controlled by this insecticide, and Thrips are kept within bounds. So also is Mealy Bug. Experiments made in Guernsey in houses containing vines infested with this pest proved very satisfactory. The cost of fumigation is low. To fumigate a glasshouse of 40,000 cubic feet, at a dosage of one quarter-ounce per 1,000 cubic feet, costs less than two shillings, apart from the cost of labour.

Young Gardeners and the John Innes Horticultural Institute.—We desire to draw the special attention of young and enthusiastic gardeners to an advertisement in our columns wherein the John Innes Horticultural Institution announces five vacancies for Exhibitioner Gardeners on January 2, 1928. In these days when the value of a training on scientific lines is so widely recognised and special qualifications are necessary for nearly all responsible posts, we feel sure that this opportunity will appeal to the more intelligent type of young man who wishes to take up horticultural work as a profession. The John Innes Institute gives a thorough training in the practice of horticulture, including the management of public gardens and parks, fruit cultivation, and the growth of flowers under glass for market. Lecture courses are given in the scientific principles underlying horticulture, and in addition there are opportunities for exhibitioners to become acquainted with the very important scientific investigations going on at the Institution. The Exhibitions are tenable for two years, and carry a subsistence allowance of £2 sing to £2 7s. in the second year.

On the Control of Glasshouse Insects with Calcium Cyanide." By H. W. Miles. *Annals of Applied Biology*, Vol. xiv., No. 2, May, 1927.

Scottish Sweet Pea Trials.—The Committee of the Scottish National Sweet Pea, Rose and Carnation Society has decided to continue the trial of Sweet Peas, not in commerce, in 1928. The plants will be grown on the cordon system, by the Secretary, at Westwood Cottage, Helensburgh. Twenty-five seeds of each variety should be sent, to reach the Hon. Secretary, Mr. John Smellie, Westwood Cottage, Helensburgh, Dumbartonshire, not later than September 20, as the last week of that month is the best time to sow in Scotland. A charge of five shillings will be made for each variety, and raisers are requested not to send any but those varieties which they consider are properly fixed.

Swanley Horticultural College Scholarships.—As a result of the entrance scholarship examination at Swanley Horticultural College, Miss Stella Lee, has been awarded a scholarship of £40, and Miss Marjorie Harris, an exhibition of £30.

Scholarships at Wisley.—The Council of the Royal Horticultural Society will shortly consider applications for two scholarships for young gardeners, tenable in their Gardens at Wisley. Young men between the ages of seventeen and twenty-two with at least three years' experience in private or nursery gardens, whose means preclude them from otherwise taking a course at Wisley, are eligible for consideration. The scholarships carry remission of fees and a maintenance allowance (the exact amount of which is in the discretion of the Council after considering all the circumstances) of about £85 a year. Full particulars may be obtained from the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, to whom completed applications must be sent by August 20, 1927.

Clay Cup for a Scented Rose.—The Secretary of the Royal Horticultural Society asks us to state that the Clay Cup was awarded to Mr. Frederick Evans, 89, Shaftesbury Road, Reading, Berks., for his Rose named Abol, instead of to the Chalk Hill Nurseries, who only exhibited the Rose on his behalf.

Royal Gardeners' Orphan Fund.—Small efforts, when multiplied, produce big results, therefore we commend to the notice of our readers the action of Mr. Albert O. Marshall, gardener to the Lady Elinor Denison, Ossington Hall, Newark-on-Trent, who showed his interest in the Royal Gardeners' Orphan Fund by making a collection on behalf of the charity when members of the Newark Horticultural Society visited the gardens at Ossington Hall. The amount realised—which we have placed in our Orphan Fund Box—was £1 11s. 11d., but Mr. Marshall hopes to "forward a further sum later in the year."

Roadside Trees.—By a curious anomaly it was not until the passing of the "Roads Improvement Act" of 1925 that County Council and other Highway Authorities were permitted to plant and maintain trees by their roadsides. Urban District Councils have long been empowered to spend public money in this direction, to the great benefit of their districts. Following the passing of the Act the Kent County Council appointed a sub-committee, under the Chairmanship of Sir William Geary, Bt., to consider the subject in relation to the county roads and, more especially, the new by-pass roads. Sir William N. M. Geary, of Oxon Hoath, Tonbridge, one of the largest landowners in the county, is well-known for his love of hardy trees and his endeavours to further the planting of trees in all possible places. On his own estate he has planted widely and, in the hope of adding to the enjoyment of the public, he has planted rows of flowering trees on his boundaries where the roads are too narrow for any planting to be done by the authorities. The report of the Kent Sub-Committee has now been completed, printed and submitted to the Council. With such a Chairman as Sir William Geary the report possesses especial value, and it is to be hoped that not only the Kent County Council but other bodies will seriously consider the many

useful and practical recommendations that have been made. This committee immediately realised that "Many of the existing county main roads have not sufficient width of margin to permit of tree planting," but suggests that landowners and others might well be invited to co-operate to improve the amenities of their districts. The report deals with the various circumstances that have to be considered and includes a thoughtful selection of suitable trees which would provide a pleasant variety. The committee has considered the question of planting fruit trees by the roadsides and evidently has arrived at the conclusion that the time is not yet, though they state that "it is a question of general policy whereon we refrain from offering an opinion." The list of recommended trees includes Ginkgo biloba, Fraxinus Ornus, Ailanthus glandulosus, Liquidamber styraciflua, various Maples, Pyruses and Prunuses.

International Horticultural Congress in Vienna.

—The programme for the forthcoming Vienna Horticultural Congress is now to hand, and gives a full list of the subjects to be discussed. These include international regulations for the nomenclature of plant novelties; international agreement as to the granting of Certificates of Merit and on colour-description; state and municipal horticulture; the exchange of young nurserymen for training abroad; the position of "horticultural architects"; and the laws of inheritance in flower and vegetable raising. Detailed instructions for Congress members have been sent out from the offices of the Austrian Horticultural Society (12, Parkring, Wien 1), including a time-table of trains on the various Austrian lines, and the prices prevailing in Vienna hotels, with useful information as to exchange rates, according to which the Austrian schilling now equals 7d. in English coinage. The Congress will be formally opened in the Festival Hall of the University of Vienna on September 20, at 9 a.m., and discussions will continue until 1.30, when lunch will be taken at the Rathauskeller. At 2.30 p.m. the gardens of Schoenbrunn (now owned by the State) will be visited. The further programme includes several evening receptions, visits to a number of interesting gardens and horticultural establishments, and, on Sunday, September 25, an excursion to the Schneeberg mountain, from whence a magnificent view should be obtained of the Alps of Lower Austria and Styria.

R.H.S. Examinations in 1928.—The Examinations of the Royal Horticultural Society will be held in 1928 as follows:—*Written Examinations.*—General Examination (Seniors and Juniors), Wednesday, March 21; Teachers' Examination (Preliminary and Advanced), Saturday, March 24; National Diploma (Preliminary and Final), Saturday, May 5. *Practical Examinations.*—Teachers' Examination (Advanced), Friday, June 15; National Diploma (Preliminary), Tuesday and Wednesday, June 19 and 20; National Diploma (Final), Thursday and Friday, June 21 and 22. All entries, except those for the National Diploma, should be made on the form in the syllabus obtainable from the Secretary of the Royal Horticultural Society, Vincent Square, Westminster.

Danish Jubilee Exhibition.—To celebrate the fortieth anniversary of the establishment of the Danish Gardeners' Association, an exhibition is being arranged to take place between September 17 and 26 in Copenhagen. The exhibits are to represent every branch of gardening, horticulture and nursery work, and will give a good general idea of the high standard attained in Denmark. Excursions of various kinds are also being arranged in connection with the exhibition, which will give foreign visitors an opportunity of seeing something of a country which is very well worth a visit.

Flower Show at Harrogate.—The North of England Horticultural Society will hold an exhibition at Harrogate on August 5 and 6, in conjunction with the Harrogate Agricultural Society, and there will be no separate charge for admission to the flower-show tent. No prize schedule has been issued, so all the exhibits, private and trade, will be non-competitive.

A fine display is anticipated and hopes are entertained that next year a schedule may be issued. The Rev. J. Bernard Hall is manager of the Horticultural Section at Harrogate. H.R.H. Princess Mary, Viscountess Lascelles, hopes to visit the show.

M. John Vachoux.—It is with much pleasure we publish the portrait of M. John Vachoux of Geneva, president of L'Association des Horticulteurs de la Suisse Romande, who presided so genially and successfully over the deliberations of the annual Conference of the Federation Horticole Professionnelle Internationale held at Geneva in June. M. Vachoux is a nurseryman who has devoted special attention to the gardening features of cemeteries and churchyards and is held in high esteem by the professional horticulturists of the Canton of Geneva. L'Association des Horticulteurs de la Suisse Romande was created in June, 1920, on the initiation of the horticulturists of the town of Lausanne, the capital of the Canton of Vaud.

M. JOHN VACHOUX.

This Association has for its object the defence of the interests of nurserymen who have businesses in French and Italian Switzerland, and in accordance with the idea of its creators and especially those of its first President, the late M. Frederic Pittet, it was made absolutely autonomous, not collaborating closely with the mother society, the Association of Horticulturists. To M. Vachoux this appeared to be a fundamental error, as without the collaboration of the main or parent Society, which was ten times the size of his own, it was not possible to effect a solution of any problem of a national character, consequently when he was chosen President, in January, 1923, he already realised the importance of co-operation and worked successfully to secure that end, so that now the most cordial understanding exists between the two Associations and only the difficulties of language make it necessary to keep the two separate. For this work alone M. Vachoux has won the gratitude of nurserymen, seedsmen and florists in the southern parts of Switzerland.

London Gardens Exhibition.—The London Gardens Guild, in conjunction with the *Daily Express*, is again organising an exhibition of flowers at the Temple Gardens, Victoria Embankment—lent by kind permission of the Honourable Society of Benchers of the Inner Temple—on September 3, 4 and 5. This will afford an opportunity for Londoners to see some of the beautiful flowers grown in the gardens entered for the recent All-London Gardens Championships (in which there were over 12,000 entries), as there is a special section devoted to the prize-winners in that Competition. The Exhibition

will be on a much larger scale this year, and a very comprehensive schedule has been compiled, which includes sections for individual, as well as corporate displays by local garden societies of London-grown flowers. This is one of the rare occasions when other than professional gardeners are afforded the chance to exhibit at a great public show. It will enable them to prove to their fellow-citizens that London gardeners can provide excellent exhibits. In addition to these exhibits there will be displays from municipal authorities, and firms famous in the gardening industry will also be showing, including trade growers who specialise in plants which thrive particularly well in the London area. There will also be replicas of the prize-winning gardens. Large Gold, Silver and Bronze Medals will be awarded for the best exhibits in each of the sections, and for each of the championship classes. Schedules and entry forms are now available, and can be had on application to the Organising Secretary, London Gardens Guild, 124, Walworth Road, London, S.E. 17.

Window Box Competition in Brussels.—The Royal Horticultural Society of Brussels is organising, for the period of the forthcoming International Horticultural Exhibition in September next, a competition for flower-decorated windows, house-fronts and balconies. There will be no entrance fee, and all householders will be cordially invited to compete for the numerous diplomas, prizes and medals which are to be awarded. The idea is an excellent one, as the result will be seen in the brighter appearance of the town, with almost every window gay with seasonable flowers.

Rhododendron Association.—At the first Council meeting of the new Rhododendron Association the following were elected Honorary Life Members of the Association:—Mr. J. C. Williams, Professor W. Wright Smith, Mr. W. J. Bean, V.M.H., Mr. E. H. Wilson, V.M.H., Mr. George Forrest, V.M.H., and Captain F. Kingdon Ward. It was decided that any persons joining the Association prior to December 31, 1927, should be known as Founder Members.

Vegetable Show at Westminster.—Arrangements are now well forward for the Royal Horticultural Society's Vegetable Show which will be held at Vincent Square, on Tuesday, September 13. A schedule of thirty-seven classes is available and copies may be had on application to the Secretary of the Society; entries close on September 6. The R.H.S. Challenge Cup will be awarded to the competitor who secures the greatest number of first-prize points; the winner of the first prize in Class 1 (for a collection of a dozen kinds of vegetables) is, however, excluded from the "points" competition, as he will receive the Sutton Cup and £10. In the four classes for collections of vegetables the value of the third class single fare from the competitor's nearest station to London will be added to first, second and third prizes, but in the event of a competitor winning more than one of these prizes, only one railway fare will be paid. This sounds rather parsimonious and we think the Society should pay the return railway fare in the event of a competitor winning two or more prizes in these classes.

Standard Collection of Daffodils at Wisley.—In pursuance of their policy of giving Awards to plants intended for garden decoration only after trial in their Gardens, the Council of the Royal Horticultural Society is this year planting a standard collection of Daffodils at Wisley representative of all the recognised sections and of known value in the garden. Growers of seedlings are invited to send six (or three) bulbs of their varieties for trial against this standard collection. These bulbs should reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, so soon as possible and not later than September 15, 1927.

Royal Compliments at Liverpool.—At a meeting of the Liverpool Parks and Gardens Committee, the Deputy Chairman, Mr. Holme, moved a special vote of thanks to Mr. J. J. Guttridge,

the Park Superintendent, and his staff, for the masterly way in which the floral decorations were carried out at the Town Hall, St. George's Hall and elsewhere in the city on the occasion of the recent Royal visit. Both the King and the Queen expressed their admiration of Mr. Guttridge's artistic efforts and complimented the City upon the beauty and arrangement of the flowers provided by its Parks Department, and these gracious compliments gave rise to the special vote of thanks referred to.

Appointments for the Ensuing Week.—**MONDAY, AUGUST 1:** Wadhurst Gardening Association's Show; King's Lynn Horticultural

Killearn Flower Show. **SATURDAY, AUGUST 6:** Stonehaven Flower show; Kircudbright Flower Show; Leven and District Flower Show; Lockerbie Flower Show; Blackburn and District Horticultural Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Fortune's Yellow or Salmon-coloured Rose.*—In a "Sketch of a Visit to China in search of New Plants," published in the first volume of the Journal of the Horticultural Society, I noticed the discovery and introduction of a very beautiful yellow or salmon-coloured Rose. I had been much struck with the effects produced by it in the gardens of Northern China, where it was

to have been as successful with it as the Chinese about Ningpo and Shanghai. With him it is "a Rose nearly as rampant as the old Ayrshire, quite hardy, and covered from the middle of May with hundreds of large loose flowers, of every shade, between a rich reddish buff and a full coppery pink." Messrs. Standish and Noble of Bagshot, have been equally successful. In a letter lately received, they say: "We have had your salmon-coloured Rose in great beauty this year; the old plants in the open ground (standards) were one mass of blooms, the heads of each being more than four feet through." Such are the results in two places this year, and I dare say your correspondent "J. R." and

FIG. 31.—CLETHRA DELAVAYI.

R.H.S. First-Class Certificate, July 19. Flowers white. Shown by Mr. Gerald W. E. Loder. (see p. 78).

tural Society's show; Pershore Flower Show; Chippenham Horticultural and Horse Society's show. **TUESDAY, AUGUST 2:** Abbey Park (Leicester) Flower Show (two days); Turiff Flower Show; Royal Caledonian Horticultural Society's meeting. **WEDNESDAY, AUGUST 3:** Royal Horticultural Society's Committees meet; Northampton Horticultural Society's show (two days); Royal Horticultural Society of Ireland show (three days); Scottish National Sweet Pea, Rose and Carnation Society's show (two days); Kings Walden Flower Show; Dublin Flower Show (three days); Nottingham and Notts. Chrysanthemum Society's meeting. **FRIDAY, AUGUST 5:** Harrogate Agricultural and Horticultural show (two days); Accrington and District Chrysanthemum Society's meeting;

greatly prized; and I had no doubt it would succeed equally well in this country. But from some cause—probably ignorance as to its habits or to the treatment required—my favourite Wang-jan-Ve, as the Chinese call it, was "cried down." It had been planted in situations where it was either starved or burned up, and in return for such unkind treatment the pretty exotic obstinately refused to produce any but poor miserable flowers. Then the learned in such matters pronounced it quite unworthy of a place in our gardens amongst English Roses; and I believe, in many instances, it was either allowed to die, or was dug up and thrown away. Thus five or six years have elapsed since the introduction of this fine climber, and it has never been in its proper garb until this summer. Your correspondent "J. R., Sevenoaks," seems

Messrs. Standish and Noble, would inform you that no great amount of skill was necessary in order to bring the Rose into this state. It is perfectly hardy, scrambling over old walls like an Ayrshire, but it requires a rich soil and plenty of room to grow. The Chinese say that night-soil is one of the best manures to give it. Only fancy a wall completely covered with many hundred flowers, of various hues—yellowish, salmon, and bronze-like, and then say what Rose we have in the gardens of this country so striking, and how great would have been the pity if an introduction of this kind had been lost through the blighting influence of such ignorance and prejudice as have been shown by the person to whose care it was first entrusted. *R. F., Gard. Chron., July 13, 1852.*

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Epidendrums.—Although these Orchids are not grown to the same extent as formerly, there are a few which are well worthy of cultivation. One of the most useful and decorative species which flowers at this season is *E. prismatocarpum*, and few Orchids last in bloom over a longer period. So soon as the plants have finished flowering, any necessary repotting should be attended to. Specimens that have become pot-bound and overgrown their pots, causing them to become bare in the centres should be taken out of their receptacles, and have the back, leafless pseudo-bulbs removed, leaving only two or three behind each leading growth. Several of the portions may be placed together in moderate-sized pots or pans. Healthy plants, well furnished with leaves and sound roots may be transferred to larger receptacles to be grown on to make large specimens. This Orchid succeeds in clean *Osmunda* fibre from which all the fine particles have been removed, with a little live *Sphagnum*-moss placed on the top of the material to serve to show when the compost becomes dry. The compost should be placed firmly around the rhizomes, and pieces of the plant so arranged that the leading growths point in all directions, with sufficient pointing towards the centre to make a well-balanced specimen. Plants that do not require re-potting, but with compost ragged and untidy may be top dressed with a little new material and made presentable. I do not favour top-dressing, simply for the reason that if the material which is exposed to the air has become decomposed that which is in the bottom of the receptacles will be in a much worse state, and top-dressing also adds to the difficulty of knowing when to apply water to the plants. Newly-potted plants should be kept on the dry side for some little time until roots have entered the compost; on bright days an occasional spraying overhead will be beneficial. Whenever water is applied during the plants' active season of growth, a thorough soaking should be given but not again until they have become dry once more. This Orchid needs to be grown in a light position, where the air circulates freely and in an intermediate temperature.

Epidendrum vitellinum.—There are very useful summer and winter flowering varieties of this Orchid and both last a considerable time in perfection. The flowers are always attractive, and brighten up the cool house in their season. The plants enjoy the atmosphere of the cool house at all seasons; they should be re-potted when new growth commences. The shallow pans, in which they are best grown, should be placed in a position where the plants will be exposed to light and air. When well established and root action is vigorous, this Orchid requires liberal supplies of water until the new pseudo-bulbs are completed, but during their season of rest only sufficient moisture is needed to keep the pseudo-bulbs plump and firm.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Spring Cabbage.—A seed-bed should be prepared in an open position for the sowing of spring Cabbage. Make the soil firm before sowing the seeds for the production of the earliest supplies. Sow the seeds thinly in drills made about ten inches apart. If birds are troublesome, place a net over the beds. So soon as the young plants appear, keep them well dusted with old soot to ward off the Cabbage butterfly, which is often very destructive to seedling Cabbages. Make successional sowings until about the third week in August, according to the district, as sometimes the early sowings are apt to prove too forward, especially

when the weather remains very open. Harbinger is an excellent variety for very early supplies, and it may be grown in a very small space, the heads being very compact. A distance of fourteen inches by twelve inches apart is suitable for this variety. It is also very hardy and does not readily run to seed.

Garden Swedes.—This crop will be found useful for late use if sown now in drills drawn about eighteen inches apart, in ground which has recently been cleared of early Potatoes, Peas, etc., and is in good heart. Fork the ground over, give a light dressing of superphosphate and burnt garden refuse and rake the dressing into the soil. So soon as the plants are growing freely, afford them a dressing of old soot; keep the ground well hoed, and thin the seedlings early. Only garden varieties should be sown, and of these Crimson Top Table Swede and Bronze Top Swede are suitable for this purpose.

Onions.—Keep a sharp look-out for mildew as the recent heavy rains and cold nights have been favourable to this trouble. So soon as an attack is noticed, the foliage should either be dusted with flowers of sulphur while wet with dew, or sprayed with sulphide of potassium (liver of sulphur) at a strength of one ounce to three gallons of water. Use a very fine spray, and see that every part is wetted. This operation is best done during a dry time and in the evening.

Herbs.—At this season, many herbs will be ready for gathering. They should be cut, tied in bunches, and hung heads downwards in a dry, open shed, or against a wall in a sunny position. Keep the bunches turned occasionally until quite dry.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brockett Hall, Hertfordshire.

Chrysanthemums.—These plants have well filled their receptacles with roots and where large blooms are required it will be found necessary to supply the latter with a stimulant to keep the plants healthy. Several good proprietary manures are to be had and if these are used the maker's direction should be strictly observed. Weak soot water is a safe stimulant for Chrysanthemums and may be used freely, especially for those plants that dry out very quickly. Start feeding with the soot water, and then use weak liquid manure from the stables or cowsheds alternately with a concentrated manure. Liquid manure, may be made by placing horse or cow dung in a bag and soaking it in water for a few days before using the clear liquid. Chrysanthemums delight in a change of food and where those recommended are used good results should be forthcoming. At this period of growth strict attention must be given to disbudding and rubbing out all side shoots. It is also essential to keep all growths tied neatly to stakes or they may easily be broken off by strong winds. Single and bush plants of Chrysanthemums will also need some manual aid. Soot water and weak liquid manure will be all that is necessary until such time as the buds are taken, when a concentrated fertiliser is necessary to assist them to develop good flowers.

Richardia africana.—Arum Lilies will now require re-potting, where early spathes are required. If the plants have been rested as previously advised they should have the old soil shaken from the roots before they are potted. Select the strongest crowns for the early batch, while those of the next size may be planted out in a rich compost with a view to placing them in pots, or for lifting and planting them out in borders. The latter method is gaining favour and is practised by market growers and in establishments where large quantities of flowers are required. A suitable compost for those that are to be grown in pots consists of three parts turfy loam and one part well-decomposed cow or horse manure with broken charcoal and sand added to ensure a free passage of water. The Arum Lily when in full growth requires almost

an unlimited supply of water, therefore it is essential that good drainage should be provided. Immediately after re-potting extra care is necessary in watering until such time as the young roots are active in the new compost. In view of this it is advisable to stand the newly-potted plants where they may receive protection from heavy rains. Later, they should be placed in a sunny situation and grown on quite hardily until frost threatens, when they should be housed for the winter.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Strawberry Beds.—All plants that have been cleared of their fruits should, with the exception of those intended to supply runners for stock, be divested of the old, exhausted leaves and runners. Weeds and the straw litter should then be cleared away and the soil between the plants lightly pricked up with the fork. This is very necessary where the land is heavy and retentive to prevent it from cracking after much trampling on in wet weather followed by bright sunshine. After the beds have been cleaned and put in order dress the rows with soot and decayed manure, more or less, according to the nature and condition of the soil. Beds older than three years, unless there are special reasons for retaining them, should be grubbed up and the land utilised for some other crop. In deep and fertile soils, with reasonable attention, Strawberry plants will crop well for a number of years, but in the majority of cases three years is quite long enough to retain them.

Hautbois Strawberry.—The peculiar flavour of this Strawberry is greatly appreciated by many and it was at one time planted extensively in private gardens. It should be grown on a partially-shaded border. Set the runners about eighteen by twelve inches apart in soil of moderate richness.

Autumn-fruiting Raspberries.—In favourable seasons very good crops of Raspberries may be obtained from the autumn-fruiting varieties, the canes of which should not be too crowded. Young, weak canes and any that are not likely to bear freely should be pulled out so that those fruiting may be exposed to light and air. Keep down weeds and apply a mulch of decayed manure, especially where the soil is light. Protect the beds early from birds where these are troublesome to the crop.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Late Vineries.—The temperature of late vineries should be 70° at night and 80° to 85° by day, rising to 90° after closing the house, with sun-heat, provided there is plenty of moisture in the atmosphere. The general thinning of the bunches having been finished, examine the bunches again carefully and remove any stoneless berries that may have been overlooked to give more room where there is a possibility of the berries "binding." The roots may be given plenty of warm, diluted liquid manure and an occasional sprinkling of vine manure, guano or soot, as Muscat vines in good health are gross feeders. Keep a sharp watch for scalding at the stoning stage. If the weather is favourable for ventilating freely, scalding may not occur, but it is always wise to keep the house warm and airy at night and ventilated freely in the daytime; as a rule, this steady, warm treatment for a fortnight will prevent scalding.

Late Houses.—Very late Grapes, the bunches of which have been extra well thinned to enable them to hang long on the vines in the winter, will now derive great benefit by being kept extra warm at night, and the vinery ventilated freely through the day until the berries have finished stoning, especially Lady Downes,

which is a most troublesome variety. Grapes always scald most under sudden alternation of the temperature through changes in the weather, but rarely when the external temperature is steady. High night temperatures may be maintained as for Muscats, and if sun-heat be insufficient, fire-heat should be used through the night to prevent condensation of moisture and help to increase the size and colour of the berries, which double the amount of warmth will not give later in the autumn.

Late Figs.—Fig trees in late houses with fruits swelling or ripening should be kept moderately moist at the roots, and the stems, walls and floors damped freely on bright mornings. Water, however, should not be allowed to touch the fruits or foliage, as an excess of moisture, especially when the lights are closed would result in the fruits splitting. Late trees which produce only one good crop, and that only by the aid of sun heat, should not be pinched as second growths rarely ripen. The shoots should be trained thinly on the extension principle and when they reach the limit of the house may be cut out to make room for others. The secret of success with late Figs consists in keeping the young growths short jointed, by no means gross, and trained well apart. Many trees that are making extra strong growths should be root-pruned by the end of September.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Lavender.—Where the flower spikes are required for drying, they should be cut in their prime. In common with other flowers and leaves used for making pot-pourri, they should not be dried in the sun, but under cover in a cool, airy building; if dried in the sun they become hard and brittle and quickly crumble to pieces. When properly dried, the Lavender flowers should be stripped off and placed in small bags or pillows.

Colchicum autumnale.—There are several varieties of this plant, and they are ideal subjects for planting in grassy places in the wild garden, where they look much better than in formal beds or borders, for, unless they are carpeted with some dwarf evergreen subject, their flowers become splashed and spoiled with soil during heavy rains. Some of the choicer species and varieties of Colchicum are suitable for planting in the rock garden, where they may be associated with dwarf, evergreen, carpeting plants. Although the individual flowers do not last long, they are, as a rule, produced in succession over a long period. Colchicums, especially the autumn-flowering species, should be planted so soon as they are received from the bulb merchant. In addition to *C. autumnale* and its varieties, other good kinds are *C. Parkinsonii*, *C. Bornmulleri*, *C. cilicicum*, *C. giganteum*, *C. montanum*, *C. variegatum* and *C. speciosum*.

Lilium candidum.—Where it is intended to plant or replant this beautiful Lily it is important that the work should be done during August or at the latest early in September, for this Lily commences to make its growth at that time. This species succeeds in a good medium loam and being a lime lover, a dressing of old mortar rubble, or failing this, lime should be added to the soil. A dressing of basic slag applied at the rate of 6 ozs. to 8 ozs. per square yard may be used instead of lime. A sunny open situation with some shelter from cold winds during early spring, is best suited to the successful cultivation of this Lily. Shallow planting is also essential; the top of the bulbs should not be covered with more than two inches of soil, they will then gradually raise themselves to the surface. In most cases when this Lily is really doing well the bulbs are exposed on the surface of the soil. The plants suffer much from attacks of *Botrytis cinerea*, which ruins the foliage and in bad cases may affect the bulbs. As a preventive it is a good plan, when lifting the bulbs, to dry them for a few days, and then dust them thoroughly with flowers of sulphur before replanting them. During the growing season

they should be sprayed several times with liver of sulphur at the rate of one oz. of the specific to three gallons of water. A little soft soap added to the mixture will render it more adhesive.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Clearing Strawberries.—Where the older plantations of Strawberries have passed their useful stage, the plants may now be dug up and the ground utilised for other crops, such as late Broccoli. The soil for this crop will not require much preparation; the surface should be stirred deeply with the Dutch hoe or other

sections for replanting. If a new site can be found for these Irises, so much the better, but if from force of circumstances they must be replanted on the old site, the ground should be deeply dug, cleaned and manured, and made firm by treading before replanting. It is a mistake to plant the creeping rhizomes deeply; lay them along the ground, cover lightly with soil and peg them down to prevent movement until new roots have formed. In many gardens these Irises do not flower so freely as they might because, from some mistaken idea, they are often planted in shaded places, where they grow freely enough but give very few flowers. They are best planted in the open where they will receive their full share of sunlight.

Hydrangea Hortensis.—The many charming varieties of this old plant which have been raised

FIG. 32.—ROSE MARGARET ANNE BAXTER.
N.R.S. Gold Medal, July 15. Flowers white. Shown by Messrs. T. Smith and Son.
(see p. 76).

cultivator, thus leaving a surface loose with a firm root-run beneath, under which conditions late Broccoli may be expected to make short-jointed growth and be able to withstand the winter. If layers of the Strawberries are plentiful, sufficient young plants should be secured early to provide plants for forcing next season, either by layering them direct in small pots or into pieces of turf. See that the runners are regularly supplied with water in dry weather.

Bearded Irises.—The present is a most suitable time to divide and replant all the members of this popular section of Iris. Where the plants have been growing on the same site for several years they tend to become infested with some of our worst perennial weeds, such as "Goutweed" (*Agopodium podagraria*), and the opportunity should be taken, when dividing them, to get rid of this pest. In the case of very old clumps, the rhizomes spread outwards leaving the centre of the clump almost bare; these central parts are thoroughly exhausted and should be removed, reserving only the outer

during late years are all readily propagated by cuttings of half-ripened shoots inserted in sandy soil and shaded for a time. These, if placed singly in small pots and given a slight bottom heat, soon become established, and may then be grown on, either as single-stemmed specimens, or made to carry three or four smaller heads as desired. The colouring seen at exhibitions is most attractive, but I am afraid many purchasers must have been disappointed with their own results when growing them in the ordinary way, without the assistance of one or other of the powders which are used to produce or rather, intensify, these colours. Many varieties of Hydrangeas are quite hardy out-of-doors in the West and form large bushes several yards in diameter, which carry hundreds of flower-heads each autumn, and if these newer varieties could be grown in the same manner and come true to colour, the effect would be wonderful. Imagine, for instance, a large lawn group of well developed specimens of the comparatively new and brilliantly coloured variety Parsifal, in full bloom!

ALPINE GARDEN.

SILENE HOOKERI.

THIS beautiful species comes from California, and is a first-rate rock-garden plant. It has a fleshy, Carrot-like underground root, from the crown of which radiate a number of straggling, prostrate stems carrying large, handsome blossoms of a clear, soft pink. Each of the five petals is deeply slashed into four narrow segments, and each flower is about an inch-and-a-half in diameter, so that a well-flowered specimen is uncommonly showy and beautiful. Grown in the open rock garden, *Silene Hookeri* should be given a deep root-run in a light, rich,

FIG. 33.—SILENE HOOKERI.

gritty loam or moraine and a warm, sunny position. The best means of propagation is by seeds.

Silene Hookeri is especially good as an alpine-house specimen. Here it may be grown either in a pan or a pot, or planted out. Late last June, I visited Mrs. Walter Jones' interesting garden at Aberuchill Castle, in Perthshire. Here, under Mr. Brooker's skilful care, is one of the most successful alpine houses I have yet seen. It is a span-roof house specially built for the purpose. On one side of the central path is staging, with alpines grown in pans and pots, whilst the other side of the house is treated as a permanent rock bank. Here many choice and otherwise difficult alpines were growing to perfection, and *Silene Hookeri* was so astonishingly fine that I took the accompanying photograph (Fig. 33) of it. The large blossoms, fringed, and of a peculiarly lovely rose-pink, sitting close upon the ground, were a most beautiful sight. *Clarence Elliott, Stevenage.*

VERBENA RADICANS.

THIS distinct species is a useful plant for clothing hot, dry banks or for planting at the base of shrubs on the rock garden. Of prostrate habit, it forms a close, leafy carpet of long growths which produce roots at practically every node.

It was introduced from Chile, according to Paxton, in 1832, and is included in the list of South American Verbenas in Hooker's *Botanical Miscellany*, Vol. 1, though it is seldom referred to in the standard horticultural works, and then only as a greenhouse plant. Yet it flourishes and winters well in the open garden, provided it has a warm, dry position and rather light soil, for if planted in soil of heavy texture, it becomes rampant, producing an excessive amount of growth but very few flowers, and invariably dying out during the winter.

The leaves are divided into very narrow segments and are produced in pairs, while the flowers are borne in short spikes on stems

about four inches long arising from the axils of the leaves or terminating the growths. They are lilac in colour and sweetly scented, the corolla tubes being about twice the length of the hairy calyces, at the base of which are small, lanceolate bracts.

ACANTHOLIMON VENUSTUM.

THIS lovely Prickly Thrift is infinitely more attractive than the well-known *A. glumaceum*, which is to be found in practically every rock garden. It forms close cushions of rosettes of stiff, lime-encrusted, greyish-green leaves, which are about one inch in length, very narrow and sharply pointed.

The flowers are larger than those of *A. glum-*

aceum, and are of a rich rose colour, borne on wiry stems in loose sprays about three inches in length, the corollas protruding from yellowish-brown, funnel-shaped calyces of paper-like texture.

The species is a native of Asia Minor and should be planted in a hot, dry position, preferably in a sunny crevice containing light, loamy soil, to which an abundance of limestone chips and small pieces of rock have been added. It is advisable to cover the plant with a sheet of glass during the winter in an endeavour to keep it as dry as possible. *A. G. F.*

FLORISTS' FLOWERS.

BORDER CARNATIONS.

THE best method of increasing border Carnations is by layering, and now is the best time to do this. Although in some favoured districts certain strong-growing varieties will bloom for several years and make large clumps, it is best to raise new stock annually. The operation is quite simple and well understood, although success depends very largely on the skill of the operator, especially when dealing with varieties with thin or short "grass," as the shoots are commonly called.

One common mistake in layering Carnations is the placing of fine compost in the form of a mound on the top of the ground; the best way is to draw away a portion of the soil from around the plant and to place the prepared compost in the depression.

The tongue of the layered shoot should be carefully pushed straight down into the fine compost, and the shoot pegged into position with the foliar end of the layer upright; the soil drawn from the plant should then be put over the fine compost, and this should not be much, if any, above the ground level. Any necessary watering is then more easily done, and the covering of soil over the fine compost prevents, to a large extent, birds from scratching in it. *C.*

INDOOR PLANTS.

ERANTHEMUM PULCHELLUM.

THE subject of this note is undoubtedly one of the very best winter-flowering stove plants. It was first introduced to this country from the East Indies in the year 1796, and has been known by several different names, such as *E. nervosum* and *Daedalacanthus nervosus*, while it is figured in *Bot. Mag.*, t. 1358, under the name of *Justicia nervosa*.

E. pulchellum is of bushy habit and produces its intensely blue flowers during the winter and early spring. The flowers, which are borne in terminal and axillary spikes, open in gradual succession from below upwards, thus the plants remain in beauty for several weeks.

Cultural requirements are not exacting. Cuttings should be inserted in a sandy compost in March, and placed in a propagating case, with a fairly brisk bottom-heat. When rooted, remove them from the case, and in due course pot them on as requirements necessitate. Pots having a diameter of six inches or seven inches will be large enough for the final potting. The potting compost should consist of equal parts of peat and good fibrous loam with a liberal quantity of sharp silver sand. When the larger pots are well filled with roots frequent applications of weak liquid manure or soot-water will be found highly beneficial.

From the time the rooted cuttings are removed from the propagating case until July the plants should be grown in a stove temperature and as near the glass as possible. They may then be gradually hardened off and removed to a warm pit and remain there for the summer months.

During the early stages of growth the shoots should be pinched several times to promote a bushy habit; at all times they require shade from bright sunshine. Syringe the foliage freely during the growing season and guard against attacks of green fly, thrips and red spider. A shelf or side-stage near the roof-glass, in the stove, affords the best position for plants that are to flower.

After flowering, cut back the stems and place the plants in a position where they will be encouraged to produce strong growths suitable for cuttings. Old plants may be grown on a second year, but they are never so fine as young stock. *H. T.*

CHIRONIA IXIFERA.

THIS desirable South African plant is very useful for furnishing the stages of the cool conservatory or plant house. That it may be grown to considerable size is indicated by the specimens exhibited at leading flower shows in pre-war days.

Chironia ixifera thrives in a compost of peat and loam rendered porous by the free addition of sharp sand. Over-potting is a frequent cause of failure with *Chironias*; perfect drainage is of the utmost importance. Cuttings obtained in spring offer a ready means of increase, and the plants commence to flower when in a small state. Watering needs most careful attention at all periods, and especially during winter.

The rose-pink flowers are terminal, the corolla salver-shaped, with a narrow tube and a spreading limb, which is longer than the tube; the leaves are sessile, opposite; the stem is thin, somewhat wiry, simple or branched. A group of well-flowered plants is a noteworthy feature in a cool plant house. *Ralph E. Arnold.*

SARMIENTA REPENS.

THIS decidedly pretty and somewhat uncommon little Gesneriad is not always tractable, but should succeed if grown in a shallow, well-drained pan containing a compost of chopped fibre or peat and Sphagnum-moss, with a little sharp sand and charcoal; abundance of water and a moist atmosphere are essentials as also is shade from strong sunshine. A cool Orchid house generally proves a suitable place for this attractive little plant.

The wiry, creeping stems are clothed with

opposite, small and somewhat succulent leaves, very slightly indented or toothed; the flowers, produced in summer, are solitary in the axils, and of bright scarlet colouring.

Alternative cultural methods which have proved successful are those of wiring the plant to the stem of a tree Fern, or growing it in an Orchid basket suspended from the roof of a cool greenhouse.

It is a little plant well worth the perseverance of cultivators. Introduced from Chili in 1862, the generic name commemorates Mart. Sarmiento, a Spanish botanist. *Sarmienta* is a monotypic genus. *Ralph E. Arnold.*

ORCHID NOTES AND GLEANINGS.

TRICHOPILIAS.

This genus includes some fifteen species, and two of them—*T. laxa* and *T. fragrans*—were formerly known as *Pilumnas*.

Trichopilias may be grown in pots, in teak baskets or in shallow pans; many cultivators prefer the latter on account of the facility with which they may be suspended near the glass, where the plants will receive so much light as possible during the short, dull days of our changeable climate. The various species of this interesting genus produce their flowers at different seasons of the year, but it will be quite safe, no matter which species it is, to do any necessary repotting when the new growth is about half made and about to emit new roots. They succeed in a similar material to that used for *Sophranitis*.

Trichopilias usually have flattish or elongated pseudo-bulbs, which bear a single, leathery leaf. The short scapes, produced from the base of the pseudo-bulbs, are usually pendulous, though sometimes erect. At all times water must be carefully given, and after growth is completed but little is required.

T. brevis, *T. coccinea* and its varieties, *T. laxa*, *T. Galeottiana*, *T. punctata*, *T. rostrata*, *T. suavis*, *T. suavis alba* and *T. tortilis* all succeed in an intermediate-house temperature.

T. fragrans and its varieties, *T. sanguinolenta* (also known as *Helcia sanguinolenta*), and *T. Backhousiana* succeed at the warm end of the cool *Odontoglossum* house.

Most of the better known species have large, showy, interesting flowers, and are well worth cultivating. There is one hybrid *Trichopilia*, *T. Gouldii*, raised by Messrs. Charlesworth and Co. in 1911, by crossing *T. suavis* with *T. fragrans*.

PLATYCLINIS FILIFORMIS.

This pretty plant is known as the Golden Chain Orchid, because it has drooping spikes of small, golden-yellow flowers. It should be repotted soon after it has passed out of flower, and so soon as new roots appear at the bases of the partly developed growths. This Orchid is best grown in pans suspended from the roof in a shady position in a house where a warm, humid atmosphere is maintained, as the whole family are natives of a moist region lying within the equatorial zone. The usual precaution as regards the application of water to newly potted plants is most necessary as the young growths of *Platyclinis* may damp off if water is applied too freely.

Frequent spraying of the foliage—especially the undersides of the leaves, through the growing season is beneficial—and is a means of preventing attacks of red spider, which occur if a dry atmosphere is maintained.

The usual open, fibrous material, cut up into rather small portions, answers the requirements of this Orchid in regard to potting material. *J. T. B.*

STANHOPEA WARDII.

STANHOPEAS are seen so rarely nowadays that a flowering specimen is worthy of note. A few days ago I saw *S. Wardii* flowering in Messrs. J. Cypher and Son's nurseries at Cheltenham, where the large, pendant flowers attracted at great deal of attention by reason of their fragrance and their brilliant colouring—a combination of golden-yellow, orange, red-purple and maroon. *C.*

IRIS GARDEN.

SOME IRISES IN SCOTLAND.

It is one of the drawbacks of spending the months of May and June in Essex that I generally miss the "full bloom" of the small collection of bearded Iris which I grow at Duddingston. Mr. Logan's notes on outstanding varieties in *The Gardeners' Chronicle*, of July 9, sent me back to mine to make a few notes of what remained in flower here on July 10.

The outstanding feature was a thirty-foot line of large clumps of *Ambassadeur*. It is admired by everyone and had been cut largely for friends and for house decoration, but between fifty and sixty spikes remained, and these were all over four-and-a-half feet tall, mostly with three glorious flowers (see Fig. 34). Adjoining, is a similar line of *Lord of June*, but on it only a

FIG. 34.—IRIS AMBASSADEUR.

dozen very large flowers remained. Next is a line of *Souvenir de Madame Gaudichau*; it had even fewer blooms that *Lord of June*—only a very few left to remind one how wise I was three years ago to plant so many of it. *Dominion* I had to move late in the season, and it did not bloom so well as the others, but I was glad to see some of its wonderful flowers, so rich in colour and so thick in substance—or "cloth" as the old Scotch florists called substance.

The outside line of this bed consists of *Benbow*, still largely in flower on July 10, a much admired Iris; *Duke of Bedford*, *Swazi*, *Lord Lambourne*, *Bruno* and *Mrs. Cuthbertson* had only a few flowers left here and there to welcome me—their glory had departed for the season.

Three years ago I discarded many old sorts, but of the older varieties that I like I put a clump in a mixed border, and the following were still in bloom on the date mentioned:—*Richard II*, which I like on account of its distinct white edging to its deep violet falls; *Opera*, *Ringdove*, *Shelford*, *Chieftain*, *Corida*, *Afterglow*, *Trojana*, *Eldorado*, *Asia*, *Magnifica* and the quaint *ochracea-coerulea*. All others had passed out of flower. *Wm. Cuthbertson, Duddingston, Midlothian.*

IRIS DELAVAYI.

This beautiful Iris is a member of the *sibirica* sub-section, but it is a larger and bolder plant than any of the so-called *Siberian Irises*.

It is especially useful, inasmuch as it comes into bloom just as the latter passes, but I do not find it free-flowering. In the bog, for which it is so frequently recommended, it grows vigorously but flowers sparingly. Given a wet season, such as the present, it affords a much better show in the ordinary border. I feel, therefore, that, with me, at any rate, *I. Delavayi* is best grown as a border Iris, giving the roots a liberal top-dressing of some retentive material in spring, and following this up with waterings as required.

The foliage of *I. Delavayi* is taller, broader and stiffer than that of *I. sibirica*, attaining to three or four feet. The flowers, which are carried erect, well above the leaves, are a rich plum purple with a white blotch on the falls.

IRIS JAPONICA, LEDGER'S VARIETY.

This form of *Iris japonica* is said to be very much hardier than the type. In my comparatively mild climate and well-drained soil neither of them ever suffered to any extent from frost, but up to a few years ago they flowered unsatisfactorily or not at all. *Ledger's* variety in particular made enormous growth, quickly covering such wide patches that it was dug up and thrown away by the barrowful. One autumn I took up some roots, put them in a large pot and stood the pot against a north wall where the soil became very dry and the plants exposed to a considerable amount of frost. The following April or May these pot plants, having been sunk to the rim and well watered, at once broke into bloom and continued flowering until July. It is evident that not only was winter rest desirable, but root-restriction, for having provided these two I am never without an abundance of blossom.

The leaves of *I. japonica* are broad, dark green and glossy. They rise in fan-like tufts from narrow, greenish rhizomes, and are about one foot long. Except for their much deeper green, they are very like those of *I. tectorum*. The flowers, borne on elegant sprays, are about one inch across. They open flatly after the manner of those of *I. gracilipes*, and are a very pale lavender, often almost white, fretted with small flecks of blue, or blue-purple. Instead of a beard there is a white crest, tipped with orange. The falls are beautifully waved and jagged at the margins, and this, in combination with the soft and delicate colouring, gives the blossoms a likeness to a piece of old chintz. I grew *I. japonica* in poor, stony soil in full sun. *A. T. J., North Wales.*

HARDY FLOWER BORDER.

OENOTHERA FRUTICOSA.

Of the numerous yellow flowered *Oenotheras*, this is one of the most attractive. It is a hardy herbaceous perennial, producing erect, branching red-tinted stems, two or more feet high, clothed with ovate and lanceolate, denticulate leaves.

The flowers, which are produced in leafy racemes during July, are deep yellow and about an inch-and-a-half in diameter; they open during the evening and remain attractive throughout the day.

The variety *O. Youngii* is, perhaps, more desirable than the type, being very free in growth and of a more compact, bushy habit, with bright, pale yellow flowers and large, glossy leaves. *A. G. F.*

LOBELIA TUPA.

Also known as *Tupa Feuillei*, this is a noble herbaceous plant which may be strongly recommended for a sunny position where a bold subject is desired for flowering from July to September. Though a native of Chili and possessing a reputation for tenderness, I have found *L. Tupa* absolutely hardy. One plant is growing in a free, deep loam, and is frequently subjected to 10° to 15° of frost, but it has never suffered

the slightest injury. In colder soil and bleaker localities it is said to be reliable only when covered with a mound of ashes during the winter, but my plants are never given any protection.

L. Tupa was introduced to this country over one hundred years ago. It is a robust and vigorous plant, soon making a big mass six feet in height and nearly as much across. The Foxglove-like leaves are tinted with red along the mid-rib, as are the stems, and the latter terminate in showy spikes of reddish-crimson flowers which, as I have stated, extend over several months.

Increase is easily effected by division. This *Lobelia* is said to be a good sea-side plant. *A. T. J., North Wales.*

CHELONE BARBATA.

THIS old-fashioned, hardy perennial, listed in many books and catalogues as *Pentstemon barbatus*, is a member of the *Scrophulariaceae*, and was introduced so long ago as 1752.

Considering the comparative ease with which it may be raised, and the splendid show it is capable of producing, it is surprising that it is not found more frequently in our English gardens.

The plants themselves are of a neat, tufted habit, having somewhat leathery leaves, lanceolate or linear-lanceolate in shape, and three to five inches in length, the cauline leaves being sessile. Towards the end of June the imbricated spikes are produced on stout stalks, sometimes five feet in length, along which a succession of dainty, bright coral-red to carmine flowers is borne on twiggy panicles. The lower lip of the corolla is deflexed and bears a bright yellow beard at the throat, whilst the inside is striped with dark red.

Chelone barbata is very easy to cultivate in any ordinary garden soil, and like most herbaceous plants amply repays any manurial additions to the soil. Seeds may be sown under glass in March to produce plants to flower the following autumn; or they may be sown outside or in a cold frame in a prepared bed from April to August. Plants may also be increased by division in autumn. *R. K.*

SPIRAEA UMBROSA FLORE PLENO.

THE double-flowered form of our common Meadowsweet is one of those plants which has to be known before one realises its merits. It is as superior in its own way to the type as the double-flowered *S. Filipendula* is to the single. The flowers, borne in very large inflorescences, are much whiter than those of ordinary Meadowsweet, the foliage is rather broader and denser, and while the plant does not grow too tall and lanky it will, when well-established, throw up an armful of sturdy stems.

Another point in its favour is that it does not seed and become the nuisance which the wild plant is liable to be. I find *Spiraea umbrosa flore pleno* a first-rate subject for grouping along with plants of its allies—*Astilbe Davidii* for example—which are the better for a companion of a milder hue on account of the ferocity of their colours. It is easily grown almost anywhere, even in shade, but naturally prefers a moist, rich soil with full exposure. *A. T. J.*

GENTIANA LUTEA.

THIS species is of bold and distinctive character, handsome in foliage or in flower, although not possessing the pure loveliness of its more beautiful congeners. The radical leaves are ovate-oblong, the cauline ones sessile, ovate, acute. The flowers are verticillate, the corolla yellow, veined and spotted, and the average height of the stems is round about three feet; occasionally, however, a plant will attain to even greater proportions in a favoured border where leaf-mould is present. The flowers appear in summer.

Gentiana lutea thrives in a woodland soil, in sun or half shade, and is an ideal subject for the wild garden or where woodland meets garden, and even when not in flower the large leaves will invite and merit considerable attention; frequent disturbance is inimical to the plant's welfare.

A very old plant in gardens, *G. lutea* was introduced so long ago as 1596; it provides the Gentian Root of commerce. *Ralph E. Arnold.*

FLOWER GARDEN.

KOCHIA TRICHOPHYLLA.

THIS handsome-foliaged plant has been well named the Summer Cypress, as it has the general appearance of a diminutive *Cupressus*. It is a half-hardy annual about 2½ feet high and as a "dot" plant in large beds has much to commend it. It also associates well with such dwarf subjects as *Begonias* and *Nemesias*. The delicate light-green foliage assumes a beautiful crimson tint in autumn, gradually changing to brown as it dies. To obtain good specimens seed should be sown in brisk heat, during February and the seedlings transferred to a cooler house at an early stage and placed in small pots in fairly light soil so soon as large enough. After potting afford these a position near the roof glass of the greenhouse.

Planting out should take place in June, allowing ample room for development and, where possible, selecting a site away from trees, walls, etc., in order to ensure that perfect symmetry this subject attains in the open.

Kochia trichophylla is useful as a pot plant for the conservatory or as single specimens on terraces, whilst sprays of its foliage may be utilised with pleasing effect in vases, in association with suitable flowers. *E. J. Bryant.*

SALVIA PITTIERI.

THIS, certainly one of the best of the Sages, is, unfortunately, not hardy; it is, however, exceedingly beautiful when planted in a cold greenhouse, or the plants used for the embellishment of the summer garden. A supply of plants for the ensuing season may be obtained by rooting cuttings in the late summer and early autumn. As a permanent subject, this delightful plant may be tried at the base of a south or south-west wall and afforded protection during the winter months; it is much less tender than *S. splendens* and should certainly be afforded every facility for permanently gracing the garden with its vivid, blood-red flowers, which are produced in great profusion throughout the summer and are of velvet-like texture. The flower spikes are several inches in length and the foliage is of a lovely and refreshing green colour.

A position in full sunshine and plenty of moisture at the roots are essentials required by this brilliantly-coloured Sage from Costa Rica. *Ralph E. Arnold.*

BULB GARDEN.

FRITILLARIA ARMENA.

A LEARNED pundit tells us that the little Snake's Head Lily generally known as *Fritillaria armena*, should be termed *F. Sibthorpiana*, but it is usually offered in catalogues as *F. armena*. It is a delightful plant with cone-shaped bells of yellow. It is only a few inches high and the flowers droop elegantly. It is hardy, although, like some of the other *Fritillarias*, it has ways of its own, difficult to find out, and may die off if not happy. It is not expensive to purchase, and those who wish to try it may do so without a big strain on their finances.

The writer referred to above who casts doubt upon the name, states that the true *F. armena* has dull purplish flowers. All that I venture to state is that I have had collected bulbs sent me from a reliable source in Asia Minor and from these I had specimens identical in everything except the colour of the flowers, some being yellow, others greenish and others dull purple. The yellow was the most attractive.

Rockwork would appear to be the most suitable abode for this *Fritillaria*, which is so dwarf that it has little effect elsewhere unless it can be planted by the hundred in grass. *S. Arnott.*

TREES AND SHRUBS.

LILACS.

LILACS, with their free-flowering propensities, wide range of fine colours and delicious fragrance, are amongst the glories of British gardening in the spring; the noble proportions to which specimens will attain, and their compact, yet free, growth, render these shrubs ideal subjects for park planting, and they are rarely seen to better advantage than when boldly massed and allowed ample room for the full development of each individual specimen. As isolated lawn plants they are difficult to surpass, and a shrubbery or shrub border cannot be considered representative unless it includes some examples of choice Lilacs.

Any ordinary good soil meets the requirements of these accommodating subjects, but like so many other "easy" plants, their health and vigour may be considerably enhanced by a little attention; an annual mulching of well-rotted manure, and the regular removal of all suckers are two simple operations exercising great influence over development and future success.

It is wise to remove the faded inflorescences, at any rate from choice varieties, as these, if allowed to remain, tend to retard the progress of new growth.

Lilacs may be increased by suckers, and for the propagation of choice varieties shield budding may be practised, using a pushing bud in April or a dormant bud in summer; crown grafting or cleft grafting in March is practicable on dwarf or standard stocks. Seedling plants are the best stocks, as they do not produce suckers so freely, but, personally, I think that cuttings offer, perhaps, the best method of propagation, eliminating, as they do, the sucker evil.

When forming a collection, species, of which there are a considerable number, should not be ignored, as many display great beauty allied to distinctive character.

Syringa japonica (syn. *Ligustrina amurensis* var. *japonica*) has creamy-white flowers and is a handsome shrub from Japan; *S. Josikaea*, rosy-lilac, and odourless, is also fine. *S. Emodi*, with large foliage and purple flowers, came from the Himalayas in 1840, while *S. E. elegantissima* (syn. *variegata*) is a most distinctive shrub with soft yellow and green leaves and creamy flowers.

S. persica produces a profusion of small, erect, pale-lilac inflorescences, its massed effect being quite pretty; there is a white form, *S. p. alba*. This very old plant was introduced from Persia in 1640. *S. villosa* has rose-pink flowers and came from North China in 1880.

Of the newer species mention must be accorded *S. Sargentiana*, with large leaves and salmon-rose flowers freely produced; *S. Wilsoni*, pale pink or mauve-pink; and *S. Sweginzowii* superba from Central China, with narrow, dull green leaves and long racemes of soft pink or flesh coloured flowers, a very fine species and deliciously fragrant.

S. vulgaris, the common Lilac, has been cultivated in gardens since 1597; it is widely distributed from Central Europe to Persia and displays many varietal forms.

Of the wide range of magnificent garden varieties, the following is a carefully compiled selection of the best forms:—Excellent varieties with single flowers are Congo, red; Gloire de Lorraine, light blue; Marie Legraye, a well-known white; Souvenir de L. Späth, dark red; Mont Blanc, white; Saturnale, bluish-mauve; Hugo Koster, mauve, and Charles X, rosy-purple.

Of varieties with double flowers, a representative collection should include Alphonse Lavallée, blue, shaded violet; Charles Joly, dark red; President Carnot, pale lilac with white centre; President Grevy, blue; Doyen Keteleer, pale pink; Emile Lemoine, pink; Leon Simon, blue, suffused rose; Madame Casimir Perier, pure white, very free; Michael Buchner, rosy-lilac; Edith Cavell, creamy-white; Miss Ellen Willmott, a grand white; President Loubet, carmine-purple; President Viger, mauve; Victor Lemoine, mauve of a clear tint;

Le Gaulois, deep pink; Mathieu De Dombasle, reddish-mauve; and the old favourite white, Madame Lemoine.

There is no need to stress the value of the Lilac as a forcing plant, for it is well-known, an important matter in this connection being the selection of suitable varieties, of which Marie Legraye and Hugo Koster are good types, as are also Charles X and Souvenir de Louis Späth. In conclusion, I may add that of several firms to whom we are indebted for the advancement of the Lilac, the house of Lemoine occupies a high position. *Ralph E. Arnold.*

FORSYTHIA INTERMEDIA.

SAID to be a hybrid between *Forsythia suspensa* and *F. viridissima*, the subject of this note has acquired the good points of both those species. Here it is semi-evergreen, and while the branches are quite stiff enough to stand erect, they lack none of the grace of the upright form of *F. suspensa*. Generally speaking, it flowers immediately after the latter, and the golden-yellow bells are yielded in the greatest profusion along the entire length of the wand-like branches.

This year *F. intermedia* was in full bloom before the beginning of March, a month earlier its usual date. I grow the shrub in a group entirely in the open, and no pruning back has yet been done, the plants not having attained their full stature, which appears to be about six feet. There are some forms of *F. intermedia*, var. *vitellina* and var. *spectabilis*, for example, in which the colour of the flowers is of a much richer yellow than those of the typical plant, or of *F. suspensa*. This is a notable distinction in the genus, for the yellow of *Forsythias* is inclined generally to be weak in tone.

SOME SHRUBBY POTENTILLAS.

ALWAYS the earliest to come into bloom, *Potentilla fruticosa* var. *Veitchii* is, perhaps, the best of those with white flowers. It is evergreen, the leaves being a pale grey-green above and glaucous beneath, and the habit of the shrub is shapely and compact. Of slow growth, it does not look like growing to much above two feet in this garden, but it is said to attain double that stature. The flowering season extends for many weeks from mid-April and the almost pure white blossoms are about an inch across. This attractive form was introduced from Western China.

P. f. var. *Vilmoriniana* is an even more striking shrub than the above, if, indeed, it is not the finest of the whole of the shrubby *Potentillas*. Its great charms consist of the very silvery leaves, in which there is scarcely a trace of green, the unusually large flowers, which are a soft shade of creamy-ivory, and the profusion with which they are yielded nearly all the summer. This excellent variety grows about four feet tall and is perfectly hardy and easy in any good, light loam in a sunny place.

P. Farreri (of most lists) is a cheerful little shrub, its deeply-cut, fresh-green leafage making a good background for the very bright yellow flowers. But there are many forms of Farrer's *Potentilla*, at least one being introduced by other collectors. These include a white one that I have not yet seen. *P. davurica* (glabra) is a dwarf, semi-deciduous species, eighteen inches high, true specimens of which are not common in our gardens. The leaves are distinctly glabrous, the flowers, about one inch across, white, and the habit dense and bushy. This must not be confused with the more prostrate *P. mandchurica* with grey-green foliage, rather large for the size of the plant, and creamy-white flowers, an excellent rock-garden shrub.

Also hailing from Manchuria is *P. arbuscula*, apparently another form of *P. fruticosa*. This has the largest flowers of any of the yellow sorts known to me, and their colour is exceedingly rich and golden. The stems are clothed in a thick brown tomentum; the plant is quite dwarf and often has a tendency towards a trailing habit.

Yet another of very slow growth and which has not exceeded nine inches after many years in this garden, came here named *P. f. argentea*

nana. This is one of the most comely of its race; the semi-deciduous foliage is silvered with silky hairs, the leaf lobes narrow and pointed and the flowers, which first open in April are of a good size and a clear golden-yellow. *A. T. Johnson, Ro Wen, Conway, North Wales.*

PLANTS NEW OR NOTEWORTHY.

MONARDELLA LANCEOLATA.

SOME ten species of *Monardella* are found in the warmer States of America. They are the *Madronella* of some authors, and all are but small, diminutive forms of *Monarda*.

the species have strongly odorous foliage, some quite fragrant, others not at all pleasing, and *M. lanceolata* will, in the estimation of some people belong to the latter class.

PENTSTEMON EATONI.

THIS is one of the most desirable and beautiful members of the genus, and being rarely seen in cultivation it was with great pleasure I received seeds of it from an American friend who is keenly interested in *Pentstemon* species. In his letter accompanying the seeds he writes, "You will like *P. Eatoni*. I plant it thickly in long rows, and in full sun the effect is wonderful."

While still a long way from having it planted thickly in long rows, this fine plant is doing well

FIG. 35.—MONARDELLA LANCEOLATA.

The genus includes both annual and perennial species, but when considered as perennials they are unsatisfactory here, none being really hardy enough to survive our winters.

One of the most showy is *M. macrantha*, a very neat little plant with showy scarlet flowers; it is figured in the *Bot. Mag.*, tab. 6,270. Treated as annuals the plants are more satisfactory and have considerable attractions, adding an uncommon note to the annual border.

Seeds of the plant under notice, *M. lanceolata* (Fig. 35), were sown in early February, and the plants are now in flower. It reaches a height of about a foot and is a very neat, sturdy, erect-growing plant, branching freely, every shoot bearing flowers. The colour is a purplish pink and very effective in a thick group. Most of

in the border, is again in cultivation at Kew, and has been a great attraction in Mr. C. T. Musgrave's garden at Hascombe Place.

It is quite an easy species to grow. The plants were wintered in pots in a cold frame and planted out in April; the central spikes come into flower in early June, and grow to a height of four feet, with many tiers of flowers of the richest vermilion-scarlet; later on many growths start from the base of the plant, all of which will flower later in the season. Good plump pods on the central stem are already giving promise of a good crop of seeds.

It looks as though *P. Eatoni* will now remain in our gardens where, either in a bed all to itself or planted in groups in the herbaceous border, it will prove a very noteworthy and attractive addition. *T. Hay, Hyde Park.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand." or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA*

XIII.—RHODODENDRONS.

I WAS discussing 'Cherry Brandy,'; I mean, of course, the Rhododendron; and though it is still only June, perhaps I had better make a leap forward, and clear it out of the way.

Specification:—A medium-sized bush, bearing numerous six- or seven-flowered trusses of dangling, bell-shaped corollas, cherry-red with a wider or narrower white rim; occasionally the flowers are cherry-red all through. The effect when the whole bush is beaded with rain drops, and a shaft of sunshine, momentarily released from the cloudy turmoil, smites through the translucent corollas, is particularly beautiful. 'Cherry Brandy' continues in bloom till the end of July, though it is necessarily getting a little draggled by then. As a medium-sized, bush Rhododendron, I have no hesitation in giving it full marks.

On June 18, the snow had melted sufficiently to make it worth while to go up the main valley towards the pass. After the first abrupt climb, the valley, though quite narrow, was fairly level, and one could cross the torrent almost anywhere by the snow bridge.

The grass slopes, where the snow had just melted, were flooded with the violet Omphalogramma Souliei, which grew here in countless thousands. Unlike any other species I know, it bursts out of the ground in consolidated clumps, and no sooner does the first spear point perforate the soil than it unfurls out of its interior an enormous gaping flower, whose protruding chin almost sweeps the ground. At this time the plant is three or four inches high. The leaves follow, and stem and leaves continue to grow for weeks, the fruit being eventually hoisted up to a height of about eighteen inches. As a rule, the Omphalogrammas occur scattered and not very abundant, though O. Franchetii

is fairly numerous in one particular locality on the Mekong-Salween divide, as is O. Delavayi on Imaw Bum; but for sheer reckless Daisies-on-a-lawn profusion, O. Souliei would be hard to beat. Curiously enough, it does not seem to grow in the branch valley, and is extremely rare on the other side of the snow range. So far as our present knowledge of it goes, therefore, it may be written down: 'rare; locally abundant.' It is a near relation of O. Delavayi.

On the right flank of the valley was an almost

FIG. 36.—PRIMULA MULIENSIS (§ NIVALIS),
AT 10,000 FT. ALT.

continuous steep, stony slope, here broadly striped with Rhododendron scrub, there divided by a narrow band of bald gravel, rasped daily by

dendron with nodding flowers of a delicious shell pink, perched on very long, slender pedicels. It grew in clumps and colonies on the steep slopes, peeping up between its larger brethren, and doing its best to carpet the barer patches with its witching web. (K.W. 6,961). I consider it the jolliest imp in its class, "just the thing for the home; no rock garden complete without one. Quotations on application!"

Here, too, was the Field of the Cloth of Gold. The common, white-flowered, hairy-leafed, bearded, senile Anemone (one of the Narcissifloras) had suddenly become golden yellow. The 'Golden Anemone' had, in fact, staked a claim a couple of acres in extent on the limestone gravel slope, and well nigh smothered it. There must have been thousands and thousands of plants, all glowing buttercup-golden on this incline, but I never saw the plant again anywhere, another example of the queer localisation of species in the Seingku valley; Golden Anemone, K.W. 6,956; rare, locally abundant.

Higher up the gravel slope—which turned out to be of crystalline limestone, part of a band of that rock which strikes right across the country, the second of the 'Saluenense' Rhododendrons was found, a charming new species which did not flower till almost the end of June. It forms flat, tense mats, studded with large flowers of a bright rosy pink, which instead of standing well up, almost cuddle the tiny, brittle leaves. 'Limestone Rose' (R. calciphila, K.W. 6,984, 7,069) is a sheer delight, and outcrops of its vivid flowers painting the grey-white cliffs, or lining the scree, added a touch of unusual colour. I give it first-class honours. It is to be noted that it flowers much later than R. rivulare (K.W. 6,903), hardly opening, in fact, until that species is far spent; indeed, 'Limestone Rose' is not at its zenith till about the second week of July. Carboniferous limestone gardeners, please note 'Limestone Rose' as a favourite on the flat.

I seem to be deviating widely from June 18, however, so I had better return to the species

FIG. 37.—A HILLSIDE COVERED WITH RHODODENDRON SCRUB.

falling stones. On the left flank, however, which was sheltered, precipitous broken cliffs rose to a higher level, and it was only up certain selected chimneys that that side of the valley could be climbed at all.

Where gravel prevailed, I found 'Pink Baby' (R. pumilum of Sikkim and Tibet—K.W. 5,856), a dainty, dwarf Campylogynum Rhodo-

then in flower, before running completely amok.

There was the big 'Lacteam' in the dips and hollows of the gravel slope, where it formed substantial thickets. It had long narrow leaves, something like those of R. Bessianum, and large, spherical trusses of white or bluish flowers. The copper-red trunk swept off the

*The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, and June 4, 18, 1927.

ground in a gracious curve, and the branches twisted and interlaced so that the shrub attained no great height—twelve feet perhaps; but this device brought all the straying trusses together, and the effect of that frothing flood of flower breaking over the dark sage-green foliage was fine (K.W. 6,953).

Related to the last, but more gnarled and lowly, rising less than three feet above the boulders which it clasped, with smaller leaves bronzed beneath, and paler flowers, was the small 'Lacteam' (K.W. 6,954). It furnished a generous coating of green over the rough ground, streaked with snaky designs in ochre, and dazzle-painted with blobs of white foam. It was while trying to walk on this treacherous surface that I caught sight of 'Scarlet Letter,' which, at first sight, I mistook for a volcano in eruption; though a moment's reflection convinced me that it was quite noiseless enough to be a *Rhododendron*. 'Scarlet Letter' sprawls over considerable areas on the steep, slope, the stems rising a foot above the rocks and each bearing a close rosette of leaves, dark green above, silver-washed below, upon which bob the seven-flowered trusses. When these open, towards the end of June, the mass takes on the appearance of a lake of molten lava, for the flowers are the most lurid scarlet, and as one by one the buds break into incandescence, more and more of the hillside seems to be involved in this surging conflagration. Certainly I do not know a more aggressive 'Sanguineum' than 'Scarlet Letter' (K.W. 6,955).

About the same time that 'Scarlet Letter' began setting the hillside on fire, the first of three 'Lapponicum' opened its buds. I saw the flowers in the distance, a film of bright purple spread over the usual small-leaved, twiggy brooms. Nothing very remarkable in that, I thought, as I scrambled amongst the dips and crests of the fell towards the new prize. But therein I was wrong. True, the appearance of the plant—foot-high tanglements and tussocks of virgate branches beset with crisp leaves and crowned with purplish flowers—suggested nothing out of the common, and it was not until I had selected a few samples that I discovered the secret. The flowers possessed one property which is unique in my experience of the 'Lapponicum' section, and I have found quite a number; namely, fragrance. The flowers were deliciously, though not powerfully scented. Some specimens, enclosed in a tin box, scented my hut when the box was opened, and ever afterwards the fragrant 'Lapponicum' was watched and guarded with jealous care; luckily it was abundant.

At the beginning of July, the second 'Lapponicum' awoke from its long sleep and put on fine raiment. It was a large, bushy plant, like *R. hippophaeoides*, sometimes as much as three feet high, and I had watched it anxiously for weeks. There was one plant near my hut, an outlier of the main body; up the valley, below 12,000 feet, there were several thickets; but like all 'Lapponicum' bushlets, it was most at home at about 13,000 feet, where the three of them had the windy fells to themselves. This second 'Lapponicum' then flowered in due course, and created another surprise, for the flowers were of such a deep plum-juice-purple as to look almost black on a dull day, though when the sunlight played on them they twinkled and shone with a metallic glitter. They were very free-flowering, too, and in a mass made a fine display.

The third and last 'Lapponicum' was of the midget type with tiny, golden-scaled leaves, clothing intricate, wiry stems which rambled over the rocks. The flowers were large in proportion, and of a shade intermediate between lavender and violet; superficially, at any rate, this species has less claim to regard than either of the others. Early in July, the rather restricted alpine moorland on the exposed flank of the valley was a rippling lake of purple and violet, where the wind ruffled the broom tops.

At about the same altitude on the sheltered flank were small *Rhododendrons* of other species—'Scarlet Letter' and the smaller 'Lacteam' yellow or milk-white 'Souliei,' the bushy 'Sanguineum' and the purple

'Saluenense,' which is probably *R. humicola*, or practically *R. saluenense* itself. Here and there in favoured localities were mats of the dwarf pink 'R. calciphila' ('Limestone Rose') or clumps of the pretty pale pink *R. pumilum* ('Pink Baby'). These have been already dealt with.

Two late-flowering species may be mentioned here—the ordinary plum-flowered *R. campylogynum*, and a pink-flowered 'Souliei.' The former was fairly abundant at 13,000 to 14,000 feet, but much commoner on the other side of the range, where it grew thick and tall, and was in full bloom in the middle of July.

THE ART OF OBSERVATION.

THE gardener and florist, the botanist and nature student enjoy one advantage over many of their fellows. Each has learned to keep an open eye. For the successful pursuit of his calling he must needs be observant, and this habit of noting things which many pass by with indifference stands him in good stead when he is permitted to enjoy the luxury of travel. I am not now writing of experts, such as Captain Kingdon Ward, whose delightful descriptions in *The Gardeners' Chronicle* must

FIG. 38.—SEINGHKU VALLEY; CAMP No. 2, AT 11,000 FT. ALT.

Of the latter, one patch containing perhaps a dozen plants, appeared like a strange comet in the midst of the yellow 'Souliei' and scarlet 'Sanguineum.' It was a beautiful thing, the flowers of a delicious fresh pink, otherwise not unlike the sulphur 'Souliei'—though blooming much later. It was curious how these strange plants outcropped here and there amongst their abundant relatives, and I came to the conclusion that the art of finding new good plants was largely a matter of luck; it depended on whether one had the good fortune to come upon any of these departures from the normal, mutations or hybrids, no doubt, of which there were a fair number scattered about in the choppy sea of 'Souliei,' while in flower; out of flower, many of them were alike as two Peas. *F. Kingdon Ward.*

fascinate all lovers of nature and of the East. The explorer and scientific investigator have usually had a special course of training and instruction, and therefore stand in a class apart. Until quite recent years, however, the naturalist was self-taught. He was in the true sense of the word an amateur, and was always demonstrating the truth that love begets the open vision. Thus, love for his subject did for him that which the University course is supposed to do for other students.

Down the golden haze which envelops my memories of the past half-century, thought carries me back to a notable morning in 1877. I had gone on board the river steamer plying between Hongkong and Canton, and was standing on deck admiring the scene as it lay bathed in the sunshine, when I was accosted by a fellow-traveller. He was a Hungarian,

a *privat-docent* in Budapest, and was taking a year's leave of absence in order to study life and nature in the Far East. Drawing my attention to some Pines growing on the left or northern bank of the Pearly River, he began to talk of the flora of China, the charm of the tropics, and the things he had seen in the Malay Archipelago. I then discovered how much it was possible for a traveller to observe and learn even while passing through a strange country, and was the more interested because it was very rarely that any of my fellow travellers shared in or reciprocated my appreciation of these things.

At that time I happened to be somewhat intimately associated with two missionaries then resident in Canton, the one an American the other English. The former was a keen naturalist, the latter had not a spark of the artistic instinct. I once travelled with him for a fortnight in a district where the kingfisher reminded one of a casket of priceless gems, the flowers were gorgeous and the Ferns profuse; yet I never heard, during the whole time, one single word which showed an appreciation of the charms and attractions of Southern China. The American, however, has left us more than one volume packed with description, illustration and first-hand information respecting the plants and insects, animals and races of the mainland and adjacent islands, teeming with interest; the Englishman lived to a ripe old age and passed away without bequeathing a solitary reflection or word-picture to posterity. All his long years of residence in a land which has unbounded attractions made no impression so deep that he felt impelled to place it on record.

Another experience akin to the foregoing comes to mind by the law of association. I applied, on one occasion, to a friend who was then residing in Nanking for a collection of plants typical of the district. He was a philosopher, indeed, but no botanist, and great was my disappointment to find, when the parcel arrived, that it contained a set of "Weeds of Civilisation," such as one finds everywhere. There was only one native plant, but that of such interest and beauty that it served merely to intensify the feeling of disappointment which the weeds produced. Yet when I applied to another correspondent in a more southerly district he at once "spotted" the plants which he knew would be of special interest, and sent me a parcel of well-pressed specimens which gave me great delight. The one had never learned to observe, the other was keen-eyed in regard to everything calculated to develop one's knowledge of nature. How great the loss of the former, how intense the enjoyment of the latter!

In all probability the artist and the nature lover profit beyond all others as they pass from place to place. Theirs is the trained eye, and theirs the gift of swift discernment. As they are mentally near of kin, I will regard them for the purposes of our present study as being bracketed, so that what is true of the one may largely apply to the other also. And by nature-lover I mean the amateur with wide tastes rather than the professor and specialist, since a danger often lurks in specialising, and the tendency of the specialist is to become narrow and hypercritical.

The naturalist will know enough of geology to be able to tell, as he passes through a district by train or motor, the nature of the soil and the character of the rocks. The railway cuttings are carefully scanned, since they are like the open pages of a great book many of whose leaves are incapable of being inspected. The plants, as well as the strata and colour of the rocks, have their distinctive message. On the limestone, for example, grow certain species which are looked for in vain on the dead lavas, the seas of pumice-stone, the schists or the granites. By the watercourses and in the morasses are plants which cannot find foothold elsewhere. Thus it is largely by the twofold testimony of the rocks and the plants, the soil and the flora, that the swiftly-moving traveller forms his conclusions. He notes in passing the zones within which given trees are found to flourish, where the Olive and vine, Mulberry and Fig, Pine and Birch first come into prominence, and compares what he observes as he passes from

south to north with what he sees as he climbs from the sea-level to the snow line on the Alps.

It would be difficult for a traveller of limited means and leisure, even in these days of speedy transit, to visit all the places he desires to explore, and bring back exact impressions and detailed descriptions of the same, if he had not a good-working knowledge of botany and geology. If to these he adds physical geography, zoology and meteorology, so much the better. For there is always the danger when relying on passing observations as distinguished from systematic study, of drawing wrong conclusions. Two plants dominate the scrub of the Mediterranean in April, and as they are swiftly passed they give the impression to the English traveller of Wild Roses and Hibiscus. It is only when one halts and plucks them that their true character becomes apparent, but ever afterwards they will be recognised as two different species of *Cistus*. The same applies to the different species of Heath and Broom, as well as to the many Composites and Umbellifers. Yet, who that has once seen the Mediterranean Heath or *bruyère*—from which the *briar* pipes are made—in all the glory of its Easter garb, is ever likely to confuse it with any other plant?

It is when the naturalist comes down to details however, that the value of his studies becomes most apparent. During a recent tour in Corsica and the Maritime Alps, meeting daily with a miscellaneous company of Englishmen, Americans and foreign folk, it was interesting to observe the great advantage the naturalists had over the rest of the travellers. Not only were they the first to divine when we had passed from granite to marble or mica schist; they were also the readiest, by reason of their training in the art of observation, to note other peculiarities, such as local customs and usages, changes in styles of architecture and costumes, physiognomy and language. Others might be quicker to observe the type of motor and the name of the cycle manufacturer, but the artist and naturalist excelled in almost every other department.

Observations show that, as a rule, women take a keener interest in botany than in other branches of natural history, at least, in their earlier years. One sees this continually in University examinations. A wider range of subjects, however, not only adds zest and interest to travel, but also tends to greater accuracy in deduction and generalisation, and the widest knowledge possible should be imparted to our youths, that when they go abroad they may be fully equipped both for observation and for study. During recent years, it is pleasing to note that women undergraduates and graduates have been extending their field, but even now the proportion is too small, and the number of students of natural science, outside botany, is far too limited. *Hilderic Friend, Solihull.*

MESEMBRYANTHEMUM.

(Continued from p. 430, Vol. LXXXI.)

RHINEPHYLLUM, N. E. Br.

STEMLESS, perennial, succulents; night-flowering. Leaves opposite, in 1-2 pairs to a growth under natural conditions, but in several pairs to a growth under cultivation, thickened upwards or clavate, obtuse, flat on the face, rounded or keeled on the back, rough from being covered at the upper part with small, hard, white pimples. Flowers solitary, terminal, pedicellate, bractless. Calyx subequally 5-lobed nearly down to its union with the ovary, with the basal part hemispherical. Corolla closed during the day, expanding in the evening or at night, fragrant; petals in one series, free, scarcely longer than the calyx-lobes. Stamens numerous, erect from an incurved base, and the inner densely bearded there. Stigmas 5, ascending-spreading, subulate, somewhat plumose. Ovary inferior, shallow, slightly elevated at the central part on the top, and with the margin (disk) also raised, 5-celled, with the placentas on the floor of the shallow cells. Capsule small, shortly obconical, flat on the top, with the sutures slightly raised and gaping, with 5 valves and cells; valves deltoid, reflexed

when expanded; expanding-keels as long as the valves, contiguous into a central keel throughout, with broad membranous marginal wings that, are not united in pairs between the valves; cells open, without cell-wings or tubercles. Seeds numerous in each cell, globose-ovoid, slightly compressed, with a nipple at one end, smooth.

Species 2, *R. Muiri* being the type of the genus; natives of the Karoo region of South Africa.

The name is derived from the Greek, *rhine*, a file and *phyllon*, a leaf, in allusion to the rough surface of the leaves.

In habit this genus somewhat resembles that of *Titanopsis*, Schwant., and *Psammophora*, Schwant., but the structure of the flower and fruit is quite different, and more closely related to that of *Delosperma*, N. E. Br., from

FIG. 39.—RHINEPHYLLUM MUIRI.

A, section of flower, enlarged; B, a stigma, enlarged; C, leaf, natural size.

which it differs in habit, in flowering at night, in its firm and rough (not soft and papulose) leaves, absence of staminodes and shallower cells of the ovary.

My diagram of the floral structure (Fig. 39) is made partly from a living flower of *R. Muiri* that never fully expanded, and partly from dried flowers sent to me with the living plants by Dr. Muir.

1. *R. Muiri*, N. E. Br. (Fig. 39).—Plant varying from $\frac{1}{2}$ –1½ inch in height. Root-stock stout, fleshy, producing several tufts of

FIG. 40.—RHINEPHYLLUM PILLANSII.

leaves at the top, forming a small clump. Leaves ascending or ascending-spreading, 5–14 lines long, 2–5 lines broad and $1\frac{1}{2}$ –3 lines thick at the apical part, tapering downwards to a much smaller base, trigonously clavate, obtuse or bluntly pointed, flat on the face, with sharp edges, very rounded and scarcely keeled on the back on South African plants, becoming slightly keeled (especially at the apex) under cultivation; surface glabrous, smooth on the lower half and the upper half covered with very small and slightly raised, hard, white pimples, and the edges sharply defined by a continuous, hard or cartilaginous line, the ground colour of the leaf being green or purplish. Pedicel terminal, bractless, about 6 lines long, about 1 line thick, glabrous. Calyx glabrous, dull green, tinged with purple, basal part somewhat hemispheric, but narrowing into the pedicel and about 4 lines in diameter; lobes 3–3½ lines long, $1\frac{1}{2}$ –2 lines

broad at the base, thence gradually tapering to an obtuse and slightly hooded apex. Corolla about 8-9 lines in diameter (but not seen fully open), expanding (according to Dr. Muir) after 6 p.m., and seen to be open until 1.15 a.m., but closed when inspected at 3.30 a.m., during the same night, closed during the day, fragrant; petals about 35, in one series, 2½-3 lines long and ¼-line broad, linear, obtuse, pale lemon yellow or white. Stamens numerous, erect from an incurved base, about 2½ lines long, the filaments of the inner series densely bearded at the base, white, anthers pale yellow. Disk apparently entire, but could not be properly examined without destruction of the only living flower seen, yellowish-green at the margin. Stigmas 5, ascending, shorter than the stamens and about 1½ line long, subulate and somewhat plumose, yellowish-green. Top of the ovary green. Capsule, when closed, 2½ lines in diameter, brown outside; when expanded, 4 lines in diameter and entirely ochraceous inside, otherwise as described under the genus. Seeds about ¼-line long, globose-ovoid, slightly compressed, smooth, very pale brownish, with a darker point.

Ladismith and Swellendam Divisions: In various parts of the Klein Karoo, growing on the quartz-fields and on the Bokkeveld shales, at an altitude of 1,500-2,000 feet, flowering in March and October to December, not common, Muir, 3,790! 3,884! 4,023!

This very distinct little plant is another of Dr. Muir's discoveries, and he informs me that it "closely resembles the Bokkeveld shales on which it grows" so that it is probably not easily discoverable.

2.—R. Pillansii, N. E. Br. (Fig. 40).—Habit exactly as in R. Muiri. Leaves in 2-3 pairs to a growth, ascending-spreading, 6-9 lines long, 3-5 lines broad and 2-3 lines thick at the apical part, where the leaf is dilated and much thicker than at the base, somewhat spatulately clavate, obtuse, flat on the face, with the edges not very sharp and without well defined or cartilaginous edges or edges formed of contiguous white dots, rounded on the back; surface glabrous, thickly covered nearly all over with slightly prominent hard, whitish dots on a livid, slaty-green ground. Flowers and fruit not seen.

Laingsburgh Division: Near Matjesfontein, growing upon slate-coloured shales, Pillans!

This species differs from R. Muiri by its leaves being more abruptly dilated at the apical part, rather more obtuse, without well marked, cartilaginous edges, and by their peculiar and rather livid slaty-green colour. Mr. Pillans informed me that it so well simulated in colour the shales it grew upon as to be difficult to detect.

Fig. 40 is from a photograph of the plant sent to me by Mr. Pillans, taken by my daughter about four months after it was received. N. E. Brown.

A MENACE TO TOADS.

It is an unquestionable fact that Toads (*Bufo vulgaris*) are useful animals, and their presence in gardens and greenhouses is to be desired by reason of their insectivorous habits. During the month of July, we are likely to come across injured toads, both in town and country gardens, and the reasons for this note are to consider the question from two aspects, firstly, the humanitarian and, secondly, the economic. It is desired to draw attention to the increasing number of toads suffering from myiasis in the southern districts of this country. Myiasis signifies the presence of dipterous (two-winged flies) larvae in the living body of animals, and in this case it is due to the larvae of a species of "greenbottle," *Lucilia bufonivora*, Moniez.

All normally minded people are affected when they see an animal suffer pain, and it is for this reason so much as from the economic aspect that it is suggested that all who find injured toads should immediately take steps to destroy the doomed animal. This may be done humanely by dropping the animal into boiling water or placing it in a box with a few drops of ether or chloroform. By so doing, they will

not only save the affected toad an unnecessary amount of suffering, but will lessen the number of "greenbottles" responsible for the increasing mortality of this beneficial animal.

A correspondent writing to *The Gardeners' Chronicle** remarks that after introducing toads into Peach houses, the numbers of ants, earwigs and woodlice were considerably lessened, and added that he never knew that there were so many damaged toads about.

A considerable amount of work has been done by English and Continental workers on the subject of primary myiasis in the nasal and orbital cavities of toads. Breeding-cage experiments were carried out at Wisley during July and August, 1920, and it will make for clarity if I briefly summarise our knowledge so that the danger may be lessened.

The species responsible for myiasis in toads are *Lucilia bufonivora*, Moniez, and *L. silvarum*, Meig.† The gravid female lays from twenty to forty eggs, either on the skin of the head and back or in the nasal cavities. The larvae, on emergence, make their way into the nostrils and work upwards into the brain and eyes. So soon as the larvae have penetrated into the forehead, the toad shows sign of pain, and may be seen stroking and poking at the affected spot, and constantly sneezing as if to dislodge the

jack (*B. calamita*), although it has a more local distribution, is also liable to fall a victim to myiasis.‡

It is found that in some years the occurrence of this pest is more prevalent than in others. Myiasis in toads was particularly common at Wisley in 1920 and 1926. G. Fox Wilson, R.H.S. Laboratory, Wisley.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION.

As a result of the examination held on March 23, 1927, 147 candidates (Seniors) were examined and of these nine were placed in the First Class, thirty-three in the Second, and fifty-one in the Third Class, leaving fifty-four who failed to satisfy the examiners.

Miss D. B. Watson of Aldersey Hall, near Chester, will receive a Silver-Gilt Medal, as being First.

The examiners report that on the whole the examination was satisfactory and the successful candidates showed a good knowledge of the elementary principles underlying horticulture.

FIG. 41.—TOAD SUFFERING FROM MYIASIS.

Two larvae of *Lucilia silvarum* are shown in the enlarged nasal cavity.

larvae. As the larvae approach the brain, the toad is found during the daytime walking in a stilted manner in circles, inclining its head to one side. Eventually, as the brain is destroyed, the toad quickly dies. When full fed, the larvae leave their host and pupate in the soil beneath the body, the flies emerging in from ten to fourteen days. Occasionally, it is found that the larvae lose their way and come to grief in the eye, which becomes inflamed, the iris being partially or completely destroyed. It is not uncommon to find half-blinded toads which recover their health and behave like normal specimens.

Stubbs,‡ in a paper entitled "The Reptiles and Amphibians of Essex," mentions myiasis in toads, and records that numerous eyeless animals are met with in town gardens and in confinement, and even in places far removed from towns and villages. This condition he rightly attributes to the larvae of *L. bufonivora*. He also mentions that when captive toads are fed on gravid "Bluebottles," it is only too common to find that the eggs hatch out in the stomach and destroy the animal.

Young toads are just as liable to attack as adult specimens, but it is found that when a young animal is "struck," many of the larvae die through shortage of food. Figure 41 shows such an animal, out of which thirty-one larvae were taken on July 9, 1927; the anal segments of two larvae are seen protruding from the enlarged nasal cavity.

The larger toad, commonly called the Natter-

The answers on the cultivation of Melons, Figs and Cucumbers were very good and also those dealing with herbaceous plants. The weaknesses of the candidates were shown in the lack of appreciation of the functions relating to transpiration and the life-history of the damping-off fungus. The knowledge shown of greenhouse cultivation of annuals was disappointing.

Of the thirty-three candidates (Juniors) examined, seventeen were placed in the First Class, fifteen in the Second Class and one in the Third Class. Only one candidate failed.

Mr. Eric C. Wray, of the Midland Agricultural College, Sutton Bonington, will receive a Silver Medal as being First.

The examiners report that the examination was highly satisfactory and the actual instruction had been thorough; a certain weakness of knowledge was displayed in the answers to the questions on manures and the kinds of annuals and their cultivation.

SENIORS.

CLASS I.

1, Miss D. B. Watson, Aldersey Horticultural College, nr. Chester. 2, Miss A. M. Kelly, Aldersey Horticultural College, nr. Chester. 3, Mr. Frank W. Thorns, 51, Defoe Avenue, Kew Gardens. 4, Miss Margaret Brown, 63, Eastern Avenue, Reading and Mr. K. A. Thirkeldsen, R.H.S. Gardens, Wisley, Ripley, Surrey. 6, Miss Mary L. Heap, Studley College, Warwickshire. 7, Miss H. M. Colley, Studley College, Warwickshire, and Miss R. B. Taylor, The Lawns, Thorpe Road, Peterborough. 9, Miss R. E. Bunker, Clavering, Baker St., Potters Bar.

† Richards, *Trans. Ent. Soc.*, London, Vol. LXXIV. Pt. ii., pp. 256-257.

‡ *Essex Naturalist*, Vol. XIX., Pt. iii., pp. 150-151.

CLASS II.

1, Mr. William M. Campbell, 42, Hallam St., Balsall Heath, Birmingham, and Miss H. M. Radcliffe, Studley College, Warwickshire. 3, Miss Barbara Crosland, St. Andrew's Hall, Reading. 4, Mr. Christopher R. Fry, Benson Terrace, Penclawdd, Swansea; Mr. Robert Cherry, St. John's School, Tiffeld, Towcester; and Miss K. H. Thornhill, Studley College, Warwickshire. 7, Miss M. Eddleston, Studley College, Warwickshire. 8, Mr. John L. Hooper, Duck's Hill, Northwood; Miss E. M. Howard, Lythe Hill Farm, Haslemere, Surrey; Miss F. C. L. Farrar, Studley College, Warwickshire; and Miss Mary Finch, Studley College, Warwickshire. 12, Miss G. Morgan Jones, Penwern, Cilcenerise, Ciliau-Aeron; Miss Mary Howe, Studley College, Warwickshire; Mr. E. R. Brown, 25, West Ashton Road, Trowbridge and Mr. Percy Bond, Petwood Gardens, Woodhall Spa. 16, Mr. Reginald B. Hands, 7, Arley Rd., Selly Oak, Birmingham and Miss A. C. Crookenden, Aldersey Horticultural College, nr. Chester. 18, Miss R. M. Beale, Studley College; Mr. B. O. Mulligan, R.H.S. Gardens, Wisley; and Mr. R. A. Engledew, R.H.S. Gardens, Wisley. 21, Miss Margaret Brown, Ashleigh, Harrow Rd., Linthorpe, Middlesboro; Miss Eileen Howells, Somerset Farm Institute, Cannington, Bridgwater; and Mr. Cyril Dyson, Granny Hall, Brighouse, Yorks. 24, Mr. R. L. Rogers, 2, Pitville Pl., Cotham Hill, Redland, Bristol; Mr. A. A. Culham, 79, Gladstone Rd., Wimbledon; Mr. Geoffrey Rhodes, The Heights, Thurstonland, nr. Huddersfield; and Mr. J. N. B. Holm, R.H.S. Gardens, Wisley. 28, Mr. Leonard Atkins, Botanic Garden, Cambridge; Miss Betty Chater, Studley College, and Mr. John Ivison, Gaia Fields Nursery, Lichfield. 31, Mr. William Dove, Cogenhoe, Northampton and Miss Eileen, Senior, Studley College. 33, Mr. William H. Cook, Botanic Garden, Cambridge.

CLASS III.

1, Mr. Ernest Hewitson, 79, Gladstone Rd., Wimbledon; Miss E. M. Irvine, Studley College; and Mr. J. D. Rowden, R.H.S. Gardens, Wisley. 4, Mr. Sidney G. T. Grice, 4, New Cottages, Watford Rd., St. Stephens; Miss M. C. Johnston, Studley College, St. Albans; Miss D. M. Jones, Studley College; Mr. J. L. Beddall, R.H.S. Gardens, Wisley; Mr. J. D. Stewart, R.H.S. Gardens, Wisley, and Mr. Alfred Northmore, The Gardens, The High Beech, Hollington, St. Leonards-on-Sea. 10, Mr. Thomas D. Boyd, 7, Willow Cottages, Kew and Mr. R. Williams, R.H.S. Gardens, Wisley. 12, Mr. John W. Worrall, 154, Nottingham Rd., Eastwood, Notts, and Mr. John A. Wright, Nottingham Rd., Keyworth, Notts. 14, Mr. R. J. Gutsell, 6, Church Rd., Leatherhead; Miss Alida van der Goot, St. Paul's Girls' School, Brook Green, W.; Mr. L. F. J. Paterson, Banbury, Canada, nr. Battle, Sussex, and Mr. F. W. Staddon, R.H.S. Gardens, Wisley. 18, Mr. William Turner, St. John's School, Tiffeld, Towcester. 19, Mr. Harry Roscoe, 21, Wheatfield St., Haulgh, Bolton; Mr. Ernest Maleham, 11, Northbourne Av., Morpeth; Miss G. Hibbert, Wharnccliffe, Greenclough, Whitechurch, Cardiff, and Mr. Harry H. Martin, Lynton, Brace St., Walsall. 23, Mr. John C. Irvine, Chester Gardens, Humshaugh-on-Tyne; Mr. Thomas C. Gunning, Station Rd., Wrigton, Bristol, and Mr. John W. Breed, A.V.T.C., Catterick Camp, Yorks. 26, Mr. Robert Erskine, Houston Head, Houston Ry., Johnstone, N.B.; Miss D. M. Sanders, Duffryn Newydd, Llanished, Cardiff; and Mr. A. S. Green, R.H.S. Gardens, Wisley. 29, Mr. N. E. Flitters, 18, St. Mary's Rd., Wimbledon; Mr. S. A. Powell, R.H.S. Gardens, Wisley; and Mr. W. J. Blakeway, R.H.S. Gardens, Wisley. 32, Mr. V. N. Medhurst, 63, Bourne Rd., Bexley, Kent; Mr. M. J. Peters, Beaulieu, St. Michael's Rd., Llandaff; Mr. Norman Heap, Abberley Hall Gardens, Gt. Witley, Worcester; Mr. John D. Gordon, 2, Rosebank Terr., Lillmalcolm, Renfrewshire; Mr. Robert Wadsworth, The Heys, Thongsbridge, nr. Huddersfield; Mr. A. E. Harper, Queens Park, Manchester; and Mr. V. H. Balmer, 12, Hawthorn Av., Wigan. 39, Mr. Charles Robinson, John Innes Horticultural Institute, Merton; Mr. D. Win-

chester, 79, Gladstone Road, Wimbledon; Mr. Arthur J. Brown, Cenoyre Gardens, nr. Brecon, S. Wales; and Mr. S. G. Smith, R.H.S. Gardens, Wisley. 43, Mr. Alfred Mould, Nasington, Peterborough; Mr. W. H. Sambourne, Heywood Terr., Pill, nr. Bristol; and Mr. William Lee, South Gate Street, Redruth, Cornwall. 46, Mr. William Colenso, 5 Union, St., Guernsey and Mr. W. Porter, Botanic Gardens, Cambridge. 48, Mr. Sam Champion, St. David's Hall, Reading; Mr. A. E. Large, 251, Boxley Rd., Maidstone; Miss E. M. Bennett, Rhodyate Cottage, Congresbury, nr. Bristol; and Mr. D. P. Ferens, R.H.S. Gardens, Wisley, Ripley, Surrey.

JUNIORS.

CLASS I.

1, Mr. Eric C. Wray, Midland Agricultural College, Sutton Bonington. 2, Mr. Albert E. Cartwright, Lord Wandsworth Agricultural College, Long Sutton, Basingstoke. 3, Mr. George J. Searle, Somerset Farm Institute, Cannington, Bridgwater. 4, Mr. Frederick A. Roach, Midland Agricultural College, Sutton Bonington. 5, Mr. Andrew G. Brown, The Gardens, Craigo House, by Montrose. 6, Mr. Geoffrey Eaton, Midland Agricultural College, Sutton Bonington. 7, Mr. Charles W. Wilkins, Lord Wandsworth Agricultural College, Long Sutton, Basingstoke. 8, Mr. F. W. Hambly, Seale-Hayne Agricultural College, Newton Abbot. 9, Mr. Arthur R. Boughton, 3, Bere Lane, Glastonbury and Mr. Frank Hancock, Cannington Court, nr. Bridgwater. 11, Mr. Leslie S. G. Burbidge, Lord Wandsworth Agricultural College, Long Sutton, Basingstoke and Miss K. G. Hallett, 24, Westward Rise, Barry, Cardiff. 13, Miss Mariquita Langton, The Poplars, Boxmoor, Herts. 14, Mr. Dennis Duffill, Midland Agricultural College, Sutton, Bonington. 15, Miss G. M. Baines, Stixwold, Lincoln. 16, Mr. Cyril K. Bell, Queen St., Bardney, Lincoln. 17, Miss D. I. Hopewell, Wragby Rd., Bardney, Lincoln.

CLASS II.

1, Miss Kathleen Barr, Routh Rd., Wragby, Lincoln, and Mr. R. E. Dean, R.H.S. Gardens, Wisley. 3, Miss Kathleen Brewster, The Station, Bardney, Lincoln, and Miss Kathleen Clift, Station Rd., Bardney, Lincoln. 5, Mr. John R. Quayle, John Innes Horticultural Institute, Merton, and Miss Eileen M. Kent, Station Rd., Bardney, Lincoln. 7, Mr. William Abbott, Fylde Farm School, Poulton-le-Fylde, Blackpool. 8, Mr. Ernest H. Wensley, 77, Llanfair Rd., Canton, Cardiff, and Miss D. I. Blades, Silver St., Bardney, Lincoln. 10, Miss May Clift, Station Rd., Bardney, Lincoln. 11, Mr. Ronald E. Hardwick, Pendower, Shepton Beauchamp, Seavington S. O., Somerset. 12, Mr. John Whittaker, Fylde Farm School, Poulton-le-Fylde, Blackpool. 13, Mr. Harold Barton, Fylde Farm School, Poulton-le-Fylde, Blackpool. 14, Mr. P. K. Bear, R.H.S. Gardens, Wisley. 15, Mr. Stephen Prophet, Fylde Farm School, Poulton-le-Fylde.

CLASS III.

1, Mr. J. Roberts, Heaton Park, Manchester.

FRUIT GARDEN.

DETERIORATION OF STRAWBERRIES.

KNOWING some of the growers whose Strawberry crops have failed, I am convinced that there are far more serious causes for the failure than scarcity of manure, or the use of coal ashes in gardens (as suggested by Mr. Grigor Roy, page 55).

The finest Strawberries I have grown were produced on old pasture land with a gravelly subsoil. The land was deeply trenched and heavily manured. The varieties were Royal Sovereign, Fillbasket, The Earl, King George V, and Givon's Late Prolific. My nearest neighbour, in a very old garden on a rich, dark loam, grew equally good Strawberries, and his plants

produced stronger and much darker foliage than mine. During the nine years these two gardens were under my close observation, the only difficulty experienced in the management of the Strawberry crops was caused through drought.

Upon taking charge of another garden, I found an old, exhausted Strawberry bed, and a number of young plants in small pots which had been taken from the old plants; the varieties were Royal Sovereign and Waterloo. The layers were planted out, but only a few produced any fruit the following season. The plants being clean and healthy, layers were taken from them, and the following season Royal Sovereign produced an excellent crop, but Waterloo was a failure. *C. Ruse.*

STRAWBERRY MADAME KOOL.

FROM various reports, it is quite evident that the Strawberry crop this year was undoubtedly considerably under the average. One large grower, with soil of a medium loam on a gravel subsoil, reported that his crop was seventy-five per cent. under average, and that the quality was very poor. Another grower, on a stone brash soil over clay, reported a seventy-five per cent. under average crop, but that the quality was medium.

In both cases Royal Sovereign was the worst cropper of the varieties grown. The only variety which seemed to crop well almost everywhere was Madame Kooi. One grower reported enormous crops of Madame Kooi when all other sorts failed. The soil there was a calcareous loam on a clay subsoil. Another grower, with a light sandy soil over a gravel subsoil, reported that the only variety (out of a half-dozen) which had done well was Madame Kooi.

The great drawback to this midseason variety is undoubtedly its lack of flavour. The fruits are large, a point which counts with many people when they buy anything. A Strawberry which is a strong and healthy grower and a good cropper is worth growing, even if the flavour be second-rate. *S. H.*

HOME CORRESPONDENCE.

The Scent of Roses.—It would have been impossible to have chosen three ladies who are better known in the horticultural world to judge scented Roses at the National Rose Society's recent exhibition, at Vincent Square, than the three who acted on this occasion. The method, however, of judging the Roses seems to me to be haphazard. Empirical methods must be adopted until scientific ones can be evolved; Egerton's researches on the odour of metals, which appears to be due to low vapour pressure, indicates a line by which the scent of flowers ultimately may be measured. Till some method of this kind is produced, we have, however, to rely on the human nose! Accordingly, before a judge is approved for a competition on the scent of flowers her sense of smell should be tested in a physiological laboratory. Assuming that the selected judges pass satisfactorily such a test, they should proceed to judge the flowers either in a dark room or blindfolded. Each judge should judge individually with a clerk as guide and to make any record required. After the judges have completed their tests the results should be compared, and this process should be continued until all three, or whatever may be the number of judges selected, choose the same flower. The only "catch" I see in this eminently desirable arrangement is that if this had been adopted at the National Rose Show the three ladies would probably still be smelling Roses at the R.H.S. Hall! In any case, the ladies who judged are to be thanked for what must be a very thankless task, and the *Daily Mail* and the National Rose Society congratulated on the competition, which will go far to increase the number of new Roses with old Rose scent. *William Lawrence, Burford.*

SOCIETIES.

BLACKPOOL FLOWER SHOW.

JULY 20, 21 AND 22.—The latest Corporation to enter the field of horticultural enterprise is Blackpool, and its first attempt to hold a great horticultural exhibition was made on the above dates in Stanley Park, a big, open space that is sadly lacking in trees, and where the climate and soil do not appear to very ably second Mr. Blackburn's work of planting trees and shrubs.

For an initial effort the show was a great success, but the authorities have been fortunate in so much as they have had the enterprise of Hanley, Wolverhampton, Shrewsbury, York and Southport under observation for two or three years past, not to mention the Chelsea shows.

The steadily increasing advent of town authorities into the business of horticultural

whose exhibits make up a very large part of the attractive display. Unless good business is done the trade will not continuously attend any show, no matter whether it is held in the north or in the south, or conducted by the Royal Horticultural Society, a local committee, or a Corporation.

We should like to see Blackpool Show continue, become increasingly successful and the means of creating new enthusiasm for gardening in the wide surrounding manufacturing districts as well as among those who from other manufacturing districts make Blackpool their holiday resort.

We have nothing but praise for the organisation of Blackpool show and offer congratulations to Mr. Foster, the Secretary, and Mr. Blackburn, the Parks Superintendent, who acted as Show Superintendent. Both the Mayor and the Deputy Mayor also deserve congratulations, the former for initiating the effort, and the latter for untiring work as Chairman of the Show Committee, while the generous donors of cups and

were invited to lunch after the opening of the show by Sir Walter de Freese, and to dinner at the close of the day, when the Mayor, Alderman Fenton, presided over a large gathering of well-known horticulturists. The principal after-dinner speakers were Sir Walter de Freese, Alderman Lumb, Col. Gavin Jones, Mr. G. Henslow, Mr. John Cypher and Mr. C. H. Curtis.

GROUPS AND PLANTS.

The large group classes were a fine feature of the show, but for the sake of close comparisons we should have liked to have seen the exhibits in each class placed side by side. The Blackpool Winter Garden Cup and first prize of £50, offered for the best group of flowering and fine foliage plants was won by Messrs. J. CYPHER AND SONS with one of their delightful arrangements in which they associated brilliant *Codiaeums*, *Dracaenas* and *Begonia Rex* varieties, with *Francoa ramosa*, *Gesneras* in variety, *Fuchsias* of the fulgens section, *Clerodendron*

FIG. 42.—BLACKPOOL SHOW: PART OF MESSRS. JAMES CARTER AND CO.'S GROUP FOR WHICH THEY WERE AWARDED A CHALLENGE TROPHY FOR THE BEST TRADE DISPLAY AND A LARGE GOLD MEDAL.

showmen is exceedingly interesting, and there are not wanting those who look with some concern upon the use of the local rates to found and continue big flower shows. However, the aim in each case is to provide an additional and high-class attraction to supplement those a town already possesses. This is, frankly, the aim of Blackpool, and if the end justifies the means, in so far as adding a great attraction, increasing the number of visitors, and bringing good money into the town, are concerned, then the ratepayers will have no cause to complain of the foresight and enterprise of its Council and officials. If there is an eventual loss over the business and no tangible assets to counterbalance the direct financial debit balance, then the Councillors will have to withstand sharp criticism at subsequent elections.

Whether the Blackpool show will prove a lasting success remains to be seen. No amount of rhetorical and fulsome optimism will make it a success. Success is only achieved by securing a large attendance of people who are interested in gardens and gardening, and who will place substantial orders with the trade growers

and trophies are deserving of thanks. The horticultural trade lent hearty support to the new venture, and the horticultural sundriesmen made unusually good displays. Doubtless there are many matters the Committee will alter or improve next year as the result of this year's experience, but we would suggest that there should be a thorough reorganisation of the arrangements from the entrance to the park to the entrance to the tents. First impressions count for much, and a good impression would be made if the approaches to the show tents were used for the display of outdoor gardens, rather than garden sundries, etc.

In so far as show space is concerned, the tents at Blackpool covered 85,000 square feet, and the entries in competitive classes amounted to about two thousand. Messrs. JAMES CARTER AND CO. put up the biggest trade display we have ever seen and worthily secured the premier award for their brilliant efforts. The attendance on the opening day was poor and in sharp contrast to the generous hospitality extended by the Mayor and Corporation to the judges, leading exhibitors and pressmen, all of whom

fallax, *Odontoglossums*, *Oncidium Papilio* (a very great attraction), *Cypripediums*, *Anthuriums* and *Liliums*. Palms, Ferns and *Nertera depressa* were utilised in various positions to beautify the double-arched design. *Humea elegans* added grace to the whole display. Mr. W. HOLMES, Chesterfield, secured the second prize with a very pleasing arrangement wherein *Codiaeums*, *Ixoras*, *Francoa ramosa*, *Lilium longiflorum*, *L. auratum* and *L. Henryi* were used effectively, and the towering Palms were especially good. The third prize went to Mr. T. M. PETCH, Bradford.

For a group of non-flowering plants, Mr. W. HOLMES beat Messrs. J. CYPHER AND SONS, winning a Silver Trophy and first prize with a handsome and elegant arrangement of Palms, *Codiaeums*, *Caladiums*, *Anthuriums*, *Sanchezia nobilis*, *Coleus*, *Phyllanthus* and *Begonias*; his *Codiaeums* were particularly good. Messrs. J. CYPHER AND SONS were awarded second prize, for fine *Dracaenas*, Palms and *Caladiums*, but it was obvious the Cheltenham firm had insufficient plants to complete their exhibit; indeed, we understand

that they and others were prepared only for a group facing one way, whereas a double-faced group had to be arranged. Mr. T. M. PETCH received the third prize.

The best fifteen stove and greenhouse plants were shown by Mr. FALCONER, Cheadle Royal Mental Hospital, who won the Blackpool Parks Committee Cup and first prize with capital examples of *Clerodendron Thompsonae*, *Chironia ixifera*, *Calceolaria Banksii*, *Humea elegans*, *Gesnera Fire King*, *Statice intermedia*, *Acalypha Macafeana*, *Phyllanthus rosea picta*, and two big Hydrangeas—*La Marne* (pink) and *La Marne* (blue), the latter just losing its colour a little; and *Kentia Fosteriana*. Second prize was won by Messrs. JAMES CYPHER AND SONS, whose plant of *Gloriosa Rothschildiana* was one of the best we have seen, and carried about four dozen flowers; *G. Plantii* had about a dozen yellow flowers; *Statice intermedia* was also good in this set.

Mr. FALCONER, Royal Cheadle Mental Hospital, who is becoming a very successful competitor, won several prizes for plants in the amateurs' section, and was the only exhibitor in the small group class.

The Savoy Challenge Cup for Begonias was well won by Messrs. BLACKMORE AND LANGDON with an exhibit worthy of the firm, their flowers of C. E. Pearson, Brian Langdon, John Mercer, Hilda Langdon, Albatross, Lady Cory, Grace and Pavlova being superb in size and colour; second, Mr. R. LAWRIE, Carnworth, Lanark, with cut blooms only.

The GARDEN SUPPLIES, LTD., had the best of two groups of Hydrangeas, but neither set was of a very high standard of quality.

ROSES AND CARNATIONS.

The Mayor of Blackpool's Cup, offered for the best representative collection of Roses arranged on a space twenty-five feet by five feet, was won by Mr. C. GREGORY, Chilwell, Notts., with a very bright exhibit of pillars, bushes and vases of clean, medium-sized flowers. A large basket of Lady Inchiquin formed the central feature; other notable sorts were Blossom, Hortulanus Buddé, Mabel Morse, Lady Roundway, Golden Emblem, Emma Wright and Shot Silk.

The Beckerstaffe Trophy and first prize for a display of Roses were won by Messrs. S. MCGREDY AND SON, Portadown, with a large and brilliant exhibit of fine flowers arranged in baskets, and dwarf pillars. This firm had particularly good displays of Norman Lambert, Mrs. Barraclough, Margaret McGredy, Sir David Davis, Mrs. H. Morse, Marion Cran, Shot Silk, Lord Charlemont, The Queen Alexandra, Jas. Gibson and American Pillar. Messrs. BEES, LTD., secured second prize with an exhibit that was little behind the premier display; they showed J. C. Thornton, Mabel Morse, Adonis, Ophelia, Shot Silk, Venus, General McArthur and Independence Day in fine form. Messrs. WM. LOWE AND SON, Beeston, were placed third, and they showed well.

Messrs. WHEATCROFT BROS., Gedling, Notts., led in a good competition for seven baskets of Roses, winning the Fenton Challenge Trophy with very fresh blooms of Mrs. Henry Bowles, Mrs. H. Morse, The Queen Alexandra, Shot Silk, Golden Emblem, Gwenneth Jones and Mabel Morse. Mr. CHARLES GREGORY, second, and Messrs. FRANK CANT AND Co., third.

For a basket of Tea and Noisette Roses, Mr. C. GREGORY led with Mrs. Foley Hobbs, and Mr. J. MATTOCK came second with the same variety. For a basket of single Roses, Mr. J. MATTOCK gained first prize for a fine lot of Vesuvius, and Mr. H. DREW second, with the good old Irish Elegance. Messrs. WHEATCROFT BROS. led for a basket of a Polyantha Rose; and Messrs. BEES came second with the new and brilliant Golden Salmon.

Mr. CHARLES GREGORY and Messrs. B. R. CANT AND SONS were placed first and second respectively for a dozen cut Roses, while for forty-eight blooms, Messrs. FRANK CANT AND Co. were worthily first prize winners, followed in order by Messrs. B. R. CANT AND SONS and THE DONARD NURSERY Co., Newcastle, Co. Down. The last-named firm led for two dozen

blooms with a capital set, with Messrs. F. CANT AND Co. and Mr. C. GREGORY following, as named.

For a display of eighteen bunches of decorative garden Roses, the *Blackpool Times* Trophy was won by Mr. J. MATTOCK with a beautiful set of flowers, with Mr. C. GREGORY second, and Mr. GEORGE MARRIOTT, Carlton, third.

The best three baskets of cut Roses were submitted by Mr. CHARLES GODFREY, who showed Gwynn Carr, Lady Inchiquin and Mabel Morse; Messrs. WHEATCROFT BROS., second.

The Millington Challenge Cup, offered for the best display of Carnations arranged on a large ground space, was awarded to Messrs. C. ENGELMANN, LTD., for a handsome exhibit in which there were great sheaves of fine blooms of Orange Sunstar, Saffron, Dainty, Coral Glow, Brilliant, Laddie, Janet, Spectrum and Delice.

The best of four good exhibits of border Carnations and Picotees was the one shown by Mr. JAMES DOUGLAS, Great Bookham, who won the Mather Trophy with wondrously fine flowers of King of Cloves, crimson, E. Lyall Swete, scarlet; Lt. Shackleton, Mrs. P. Vlasto, white; Bookham Beau, May Morning, Kelso, Valentine, yellow, Flamingo, scarlet, gold shaded; Peter, deep yellow; Princess Mary, Bookham Scarlet, and the old-rose Cleopatra; a very fine set. Mr. H. WOOLMAN, Shirley, Birmingham, second, with a handsome exhibit that included Cockatoo, Sir Galahad, Mary Murray and Royal Scot; third, Mr. J. R. CROWHURST, Burgess Hill.

Mr. CHARLES WALL, Bath, was an easy first prize winner in the class for a collection of perpetual Carnations arranged on a staging, and showed grand vases of Topsy, White Pearl, Laddie, Orange Sunstar, Marion Wilson, Dixie and Glorious; second, Mr. A. J. BLAIR, Chester.

ORCHIDS.

Messrs. A. J. KEELING AND SONS, Bradford, won the Bickerstaffe Trophy for a representative group of Orchids with a bright exhibit that contained some good examples of *Vanda coerulea*, *Odontoglossum crispum* Duke of York, *Miltonia Bleuana* var. White Admiral, *Odontioda Red Skin*, O. Coronation, *Dendrobium chrysotoxum*, *Anguloa Ruckeri*, and *Laelio-Cattleya Profusion* var. compactum; second prize was awarded to J. MCCARTNEY, Esq. (gr. Mr. Potts), Bolton, for a very pretty exhibit that contained *Laelio-Cattleya Profusion*, *Anguloa Cliftonii*, *Sophro-Cattleya Chamberlainiana*, *Miltonia Lambeauianum*, *Maxillaria venusta* and *Odontoglossum Queen Alexandra*. Third prize fell to Messrs. SUTTON BROS.

J. B. ADAMSON, Esq., Diggers' Hale Lane, Blackpool, led for three Orchids with well grown specimens of *Odontioda Queen Mary* var. *Oriflamme*, *Cattleya Harold* var. *alba*, and *Cymbidium Lowianum*; Mr. W. H. RICHMOND, Workington, second, and Mr. G. C. LIEBERT, Lytham, third. Mr. J. B. ADAMSON had the best group of Orchids in the amateurs' section, and showed *Cypripedium bellatulum*, *C. niveum*, *Miltonias* and *Oncidiums* in fine form. Mr. J. B. ADAMSON (gr. Mr. Howes), also won the trophy presented by Mr. Evans with an effective display containing *Cattleya Dupreana*, *Laelio-Cattleya Profusion*, fine spikes of various *Odontoglossums* and *Oncidiums*. Second prize was awarded to Col. Sir JOHN RUTHERFORD (gr. Mr. J. Lupton), Blackburn, for a display in which *Odontoglossums* figured prominently.

Mr. ADAMSON continued his success by winning the first prize for the best six Orchids, showing *Cattleya Falco*, *C. Harold* var. *alba*, *Cypripedium Rosetti* var. *Goliath*, *C. Goweriana* var. *Gratixianum*, *Odontoglossum Matador* var. *Sultan*, and *Laelio-Cattleya Hassellii* var. *alba*; Mr. G. C. LIEBERT, second.

ROCK GARDENS.

Two classes were provided for Rock and Water Gardens, one wherein water-worn limestone had to be used and the other in which any other stone than limestone was allowed. Ample space was provided in each case on a gently sloping bank and the exhibits in these two classes provided a fine display, but, as a consequence of the lateness of the season they did not present the

rich floral colouring seen in similar designs in spring.

The Blackpool Corporation Trophy (value 100 guineas) was offered for the best exhibit in the two classes and it was won by Mr. HERBERT BROOK, Whetstone, who won first prize in the limestone arrangement with a pleasing design where a trickling stream and several mountain pools provided the central feature. The lowest pool contained Water Lilies. The planting was restrained and hardy subjects judiciously placed were Thymes, Sedums, Primulas, Campanulas, and dwarf Conifers. Second, Mr. P. GARDNER, Addington; third, Messrs. G. W. THOMPSON AND SONS, Poulton-le-Fylde.

In the second class Mr. GAVIN JONES, Letchworth, was awarded first prize and also the Trophy offered by Sir Walter de Frece, for the second best exhibit in the two classes. Mr. JONES used sandstone freely and in large masses, the design suggesting a rugged ravine, with some flat spaces on top of the largest rocks. The planting was a trifle scanty and evidently one needed to be at a higher elevation than the ordinary visitor to fully appreciate this exhibit; second, THE GARDEN SUPPLIES, LTD., Liverpool, with a higher arrangement, constructed of slate outcrop; third, Messrs. J. RASHLEY AND Co., Mytholmroyd; fourth, Messrs. W. BROWN AND SON, Ormskirk.

HARDY FLOWERS.

The Lindsay Parkinson Trophy and first prize for the best display of hardy flowers arranged on a ground space, were easily won by Messrs. BEES, LTD., with a grand exhibit of finely grown and finely arranged blooms. Delphiniums were the leading feature and with these were splendid lots of *Kniphofia Russell's Gold* and Mrs. S. Smith, *Eremurus Bungei*, *Lilium regale*, *L. excelsum* and *Alstroemerias*, with *Phloxes*, *Gaillardias*, *Armeria Bees' Ruby*, *Scabious* and *Pyrethrums* along the front. Second prize was awarded to Messrs. W. ARTINDALE AND SON, Sheffield; third, Mr. W. SYDENHAM, Melbourne, Derby.

There were two large groups of Lilies and other bulbous plants and here the first prize was well won by Messrs. BEES with a very bright and bold display of *Gladioli*, *Lilium candidum*, *L. regale*, *L. excelsum*, *L. Thunbergianum* and *L. umbellatum*; second, Mr. T. M. PETCH, Bradford.

The Broadhead Trophy offered for a collection of *Gladioli* was won by Mr. H. PRINS, Wisbech, with a handsome and large group of large-flowered and *Primulinus* varieties; the former were represented by *Princess Juliana*, *Rosary*, *Halley*, *Prince of Wales*, *Orange Blossom*, *Caruso* and *Moreno*; second, Mr. F. DREW, Walsall, who showed only *Primulinus* sorts.

The best display of any species of hardy flowers, in variety, was the very delightful one arranged by Messrs. OLIVER AND HUNTER, Moniave, who showed a wide range of subjects—adopting the plural significance of the word species. Their exhibit contained *Primula Florinda*, a fine lot of spikes of *Lilium giganteum*, *L. pardalinum*, *Orchis foliosa*, and *Verbena Chaixii*; second, Messrs. M. PRICHARD AND SONS, who had a fine lot of *Kniphofias*; third, Mr. THIRKILDSEN. Messrs. BEES LTD., had the best set of eighteen bunches of hardy flowers and also the first prize lot of twelve varieties of *Delphiniums*.

Messrs. BEES, LTD., secured the foremost award for a group of *Astilbes* and had good examples of *Granat*, *Gloria*, *Venus*, *Ceres* and *Salmon Queen*; second, Messrs. M. PRICHARD AND SON, who had *Granat* in splendid condition; this variety has the richest rose red colour of any *Astilbe*; third, Messrs. W. ARTINDALE AND SON. Messrs. ARTINDALE AND SON were the only exhibitors of *Paeonies* and were awarded a second prize, as evidently the judges did not consider the award of a large cash prize and Silver Cup was justified in this case.

Messrs. BEES secured the leading prize for a group of *Delphiniums* arranged on a ground space, with the spikes cut their fine length. They showed splendid spikes of *Welsh Boy*, *Coquette*, *Queen Marie*, *Purple Splendour*, *Cambria* and *Happy Thought*; second, Messrs. HEWITT AND Co, Solihull, who had a bright exhibit

but had shortened spikes at the corners. Messrs. HARKNESS AND SONS, Bedale, led for a group of Lupins with spikes of beautiful chamois, pink and mauve shades; they also won Alderman Lamb's Cup; second, THE GARDEN SUPPLIES Co., Liverpool; third, Mr. F. DREW, Walsall. The South Shore Traders' Trophy and first prize for a collection of cut perennial flowers, annuals, grasses, Fern and Mosses was won by Messrs. M. PRICHARD AND SONS, with a handsome display in which *Poterium obtusum*, *Astilbe Betsy Cuperus*, *Astilbe Granat*, of beautiful colouring, *Kniphofia B. Prichard* and *K. King Fuad*, were conspicuously good; second, Messrs. GIBSON AND Co., Leeming Bar.

PANSIES AND VIOLAS.

These popular florists' flowers were shown in large numbers and we regret that time and space do not permit a lengthy account of the many fine displays. The leading prize-winners were Messrs. SANDERSON AND UPTON, Shelford; Mr. HENRY BAIRSTOW, Bradford, who was a particularly successful prizewinner; Mr. EDWARD CLEGG, Dewsbury; Mr. J. HOLDEN, Kelso; and Mr. A. FRATER, Edinburgh.

SWEET PEAS.

For a large collection of Sweet Peas the Jenkinson Trophy accompanied the first prize won by Messrs. HERD BROS., Penrith, with a handsome display in which we noted fine flowers of Grenadier, Youth, Powerscourt, Charming and What Joy; second, Mr. ARTHUR DEIGH, Stoke-on-Trent.

Sir RANDOLF BAKER (gr. Mr. A. E. Usher), Ranston, Blandford, excelled for a dozen bunches of Sweet Peas and also for six bunches, winning a Gold Medal in the former class. His six bunches were fine examples of Magnet, Venus, Ivory Picture, Mammoth, Wembley and Colorado.

Mr. J. HAYCOCK, Gyfelia, Wrexham, led in several of the single bunch classes, leading for a scarlet variety, with Grenadier; for a cream pink with Magnet; for a lavender or mauve variety, with R. F. Felton; and for a pink sort with Hebe. Mr. J. C. MOORHOUSE, Staining, scored for a crimson Sweet Pea with Sybil Henshaw, and Mrs. A. BESWICK, Knutsford, won first prize for a flushed variety with Dainty Maid.

In the amateurs' section Mr. S. RICHARDS (gr. Mr. S. Horton), Llwydion, Denbigh, won the trophy and first prize for a dozen bunches of Sweet Peas; Capt. Bibby, Shrewsbury, second.

FLORAL DESIGNS.

Considerable interest was shown in the class for a group of floral designs, where each competitor had a distinct position, screened from the others, after the fashion of a shop window or a narrow room. Messrs. BEES won the premier award and trophy with a fine lot of designs arranged on and around several items of handsome furniture, and with a background that indicated a pleasing wall paper. There were wedding designs—bouquets, floral bell-bowls, vases and baskets of exquisite flowers, wherein Lilies, Gladioli, Delphiniums, Lily of the Valley and Stocks were the leading subjects used. Second, Messrs. HEWITT AND Co., Solihull; third, Messrs. ARLINGTON, Hull.

Mrs. JOHN NIXON led for a basket of flowers with a charming design carried out in golden Arums, *Francoa* spikes, *Codiaeum* leaves and *Cypripediums*; Messrs. ADSHEAD AND SON, Gatley, second with golden Arums and Gladioli. Mrs. J. NIXON had the best basket of Dahlias.

For one hand bouquet Messrs. ADSHEAD AND SON led with a brilliant design in *Cattleyas* and *Odontiodas*; Mr. C. VICKERS second. Miss NEWSHAM, Aughton, led for a bowl of flowers with Delphiniums, *Kniphofias* and *Prunus* foliage, charmingly arranged. The best three bouquets came from Messrs. ADSHEAD AND SON with *Carnations* and a central design of white *Cattleyas*, *Dendrobiums* and *Francoa* sprays; second, Mr. C. VICKERS.

The centre of one large tent was filled with table decorations, no fewer than seventy-two exhibits being displayed in these classes. Mrs. J. NIXON, Alderley Edge, led for a design in Sweet Peas, using pink flowers and sprays of

variegated *Sedum Sibthorpii*; Mr. F. EMMOTT, Lancaster, second; Mrs. A. J. BLAIR, Congleton, third. For a design in any kind of flowers Mrs. NIXON was again successful with yellow Orchids and red Honeysuckle; Mr. F. EMMOTT second; and Mr. J. P. LEADBETTER, Brough, third.

For Roses only, Mrs. A. J. BLAIR, won with a brilliant arrangement of Irish Fireflame; second, Miss Newsham; third, Mrs. E. F. BROWN, Holywood, Belfast.

FRUIT.

Sir A. LINDSAY PARKINSON, Marton, Blackpool, had a best pair of bunches of black Grapes and Mr. JOSEPH MAGGEE, Maryland, Bolton, the best pair of bunches of Black Hamburgh, but the specimens, though large in berry, were not yet well coloured. Mr. DUCKWORTH, Kirkham, showed the best green-fleshed Melon, and Mr. J. G. Craven led for Peaches with grand fruits of Hale's Early and also had the best Nectarines, showing Lord Napier in splendid condition.

MESSRS. CHAS. E. SIMPSON, Ltd., York, won premier honours for a decorated table of fruit; they used pink Sweet Peas and *Carnations*, and *Francoa ramosa*, for decoration, and their leading dishes of fruits were Nectarines, Grapes, Melons, Plums, Pears and Strawberries.

VEGETABLES.

Mr. W. ROBINSON, Garstang, led for a dozen dishes of vegetables showing fine Tomatos, Peas, Cauliflowers, Cucumbers and Celery; Mr. FALCONER, Cheadle, second; and Mr. JAS. GIBSON, Welbeck, third.

NON-COMPETITIVE.

Non-competitive exhibits were unusually fine and extensive and constituted one of the great features of the show.

MESSRS. JAS. CARTER AND Co. covered themselves with glory by winning the Championship Trophy offered for the best trade display, and a Large Gold Medal, with a delightful exhibit (Fig. 42) of Clarkias, Sweet Peas, Hydrangeas, Gloxinias, Begonias, Larkspurs, *Codiaeums*, Gladioli and Palms, artistically arranged to form a garden about fifty feet square, with four fountains and an edging of fern and green, cool grass. For a very fine exhibit of vegetables, finely arranged, many of the subjects shown in pots as growing, together with Melons and Tomatos, the Raynes Park firm received another Large Gold Medal, while a third Gold Medal was awarded them for their formal garden arranged outside the tents. Coltness Gem and H. J. Jones Dahlias filled the beds of the enclosed garden, while *Campanula pyramidalis* was used with fine effect between the two fountains and pools of water.

MESSRS. ROBERT BOLTON AND SON, Birdbrook, Halstead, displayed Sweet Peas beautifully on a sixty feet run of staging, thus making one of the largest and finest exhibits of these flowers seen this season. For this display they won a handsome Trophy and large Gold Medal.

Mr. W. WOOD AND SON, Taplow, won the special trophy offered for the best exhibit of horticultural sundries: tools, garden furniture, tea houses, seats, sundials, birdbaths, blinds and stakes were all used to make up a very attractive and interesting display.

Mr. ROBERT HAYES was the winner of a trophy for a collection of Japanese Maples, dwarf Conifers, and Heaths, pleasingly arranged out-of-doors.

Yet another trophy was forthcoming, and this was won by LORD LECONFIELD (gr. Mr. Streeter), Petworth Park, Petworth, with a grand display of splendidly grown vegetables finely arranged on a flat table. This was a large exhibit and every item was of first rate quality.

MEDAL AWARDS.

Large Gold Medals.—To Messrs. CARTER AND Co., (1) for flowers and (2) for vegetables; Messrs. R. BOLTON AND SONS, for Sweet Peas; DONARD NURSERY Co., for Dieramas and hardy flowers; Messrs. ALLWOOD BROS., for *Carnations*; Mr. ROBERT HAYES, (1) for alpine and shrubs and (2) for Japanese Maples and Conifers; Messrs. DICKSON AND ROBINSON,

for flowers; KINGS ACRE NURSERIES, for fruit trees in pots; Messrs. MANSELL AND HATCHER, for Orchids; Mr. AMOS PERRY, for hardy Ferns and water garden; Messrs. TOOGOOD AND SONS, for vegetables and flowers; Messrs. DOBBIE AND Co., for Roses; Messrs. J. PEED AND SON, for stove and greenhouse plants; Mr. REGINALD WINDER, for model garden; Mr. E. WEBB AND SONS, for flowers, fruits and vegetables; Messrs. B. R. CANT AND SONS, for Roses; and Messrs. MAXWELL AND BEALE for Alpines.

Gold Medals.—To Messrs. JAS. CARTER AND Co., for formal garden; Messrs. W. H. SIMPSON AND SON, Birmingham, for Delphiniums; Messrs. C. E. SIMPSON, York, for fruit; Messrs. J. SAUL AND SON, for shrubs; Mr. J. KLINKERT, for topiary; LAKELANDS NURSERY for formal garden; Mr. T. SMITH, Newry, for rare shrubs and hardy flowers; Mr. W. Wells, for hardy flowers; Messrs. LITTLE AND BALLANTYNE, for shrubs; and Mr. H. PRINS, for Gladioli.

Silver Medals.—To Messrs. H. MORSE AND SONS, for Roses; Messrs. ALLWOOD BROS., for *Dianthus*; Mr. R. MANSON, for Roses; Mr. W. TUCKER, for alpine; Messrs. JARMAN AND Co., for hardy flowers; Mr. W. EASLEA AND SON, for Roses; Messrs. JONES BROS., for hardy flowers; Messrs. BLACKMORE AND LANGDON for Phloxes; Messrs. R. JOHNSON AND SON, for alpine; Mr. E. T. RIGG, for alpine; Mr. J. SLATER, for Roses; Mr. H. HEMSLEY, for *Sidalceas*; Messrs. S. BROADHEAD AND SON, for tennis courts; Mr. E. H. WILLIAMS, for shrubs; Messrs. STUART, LOW AND Co., for Orchids; R. ASTLEY-BELL, Esq., for Orchids; Messrs. ISAAC HOUSE AND SON, for Scabious; and Mr. EDWIN LOMAS, for Irises.

Bronze Medals.—To Mr. F. RICH, Mr. K. THIRKELDS, Mr. G. AITKEN, Miss McCORMICK; Messrs. WHEATCROFT BROS., Messrs. S. BERKLEY AND Co., Mr. H. S. BEVAN and Miss DORIS BEVAN.

GUILDFORD AND DISTRICT GARDENERS'.

APART from the Summer Show, which again surpassed all previous efforts, about 500 members and friends had the privilege of visiting the Rose Garden of Mr. Councillor W. HARVEY, at Topcroft, Guildford, during June. This is a small garden in the town, and was a revelation of what can be accomplished by an amateur who loves Roses. Mr. HARVEY is a member of the Council of the N.R.S. and has been a judge at the National Shows; he is one of the leading spirits of the newly-formed Rose Society in Guildford, an offshoot of the Gardeners' Association with which he is actively identified.

The next event was a visit on July 2 to the gardens of J. J. JOICEY, Esq., The Hill, Witley, famous for its Orchids. The Hill is a modern mansion built by the late Birkett Foster, R.A., and is pleasantly situated in one of the Pine districts of Surrey. The situation undulates amidst natural scenery of great beauty which lends itself to the picturesque, and here nature and art have created a garden of infinite charm.

Under the skilful superintendence of Mr. J. MACKAY, the gardener, choice plants, indoor and out, are brought to perfection. A bed of Roses, edged with Violas came in for much admiration, as did many other things, not forgetting a fine crop of Raspberries in the vegetable garden, which is reached by a pleasant path through a Pine wood. Apples had escaped the ravages of April frosts, and promised a good crop. Mr. JOICEY has a superb collection of butterflies, containing over a million specimens, one of the largest in the world and valued at over £100,000. As a special privilege the visitors were allowed to inspect the collection which proved so fascinating as to restrict the time for the garden, but it added enormously to the enjoyment of the day.

The latest outing was on Saturday, July 16, when another party visited the gardens at Downside, Leatherhead, by kind permission of LADY HULTON. Here again is a magnificent garden under the efficient management of Mr. DINES, who conducted the visitors over the establishment. There is a good deal of glass at Downside and the houses are well stocked with fine displays of *Streptocarpus*, *Gloxinias*,

Petunias, Carnations, Peaches, Nectarines and many other favourites; but the most striking feature consisted of wonderful Begonias in mixed colours. Outdoors, the gardens are well kept. The Loggia adjoining the mansion was effectively draped with rambler Roses in full bloom; a very pretty sight. Another attractive scene was the Italian garden with its large pool of Nymphaeas in flower. Clipped golden Yews enclosed in a tall Yew hedge proved another attraction. A break in the hedge revealed a bed of lovely Delphiniums with its contrast of blue—and in the distance a pergola of climbing Roses made a vivid splash of colour against a dark background.

Beds of dwarf Roses had suffered from recent storms but long stretches of American Pillar and kindred sorts were magnificent. In the rock garden and elsewhere many other subjects came in for admiration.

At the tea-table on each occasion Alderman W. T. PATRICK, J.P., the indefatigable President, expressed thanks to J. J. JOICEY, Esq., and LADY HULTON for permitting the respective visits.

The next outing will be to Petworth Park on Saturday, August 13.

SCOTTISH PANSY AND VIOLA.

At the second meeting of the season, held at Glasgow on Saturday last, five Pansy and four Viola seedlings were submitted to the Judging Committee and the following awards were made:—

CERTIFICATE OF MERIT: *Colin Wilson*, fancy Pansy, raised by Mr. ALEXANDER COCHRANE, Fauldhouse (Prussian blue blotches, margined French white, splashed wine colour on the top petals); *Alice Taylor*, fancy Pansy, raised by Mr. QUINTEN MCFADYEN, Carlisle (dark velvety black blotches, edged cream); *Viola Jean Lister*, raised by Messrs. ALEX. LISTER AND SON, Rothesay (creamy-white ground, edged blue).

FALKIRK AND DISTRICT ROSE.

In certain respects the Show held at Falkirk on July 23 compared unfavourably with those of recent years. On this occasion a large entry had been received but owing to successive rainstorms earlier in the week many competitors were unable to stage their blooms and several nurserymen had to cancel their entries of trade displays.

The quality of the Roses was much better than was expected. The best collection of Roses judged for artistic arrangement and quality of blooms came from Messrs. THOMAS SMITH AND SON, whose outstanding flowers were Mrs. E. T. HUDSON, Duchess of York, Eva Eakins, Angèle Pernet, Ruth, Mabel Morse and Shot Silk. Messrs. JAMES FAIRLEY AND Co. were second, but the positions were reversed for six baskets. The Stanraer firm excelled in the classes for twenty-four and twelve blooms, of which the red shades were particularly strong. A huge bloom of Mrs. HUDSON was selected as the best Rose in the Show, and Mrs. Barraclough, Courage, Mabel Morse, Capt. Ronald Clerk and Dr. A. I. Petyt also testified to a high standard of cultivation. The first prize in the white class was won by Messrs. FAIRLEY AND Co. with twelve clean blooms of Marcia Stanhope, and Messrs. G. PATON AND SON proved to be the winners of the crimson class with a dozen fine blooms of Capt. Ronald Clerk.

Excellent Roses were also shown in the gardeners' and amateurs' classes where the chief prize-winners were Mr. D. MONTGOMERY, Bainsford (eighteen blooms, 6 vases decorative and one vase yellow), Mr. W. R. GAIR, Ardfour (twelve blooms H.T.'s), Mr. JAMES BOYD (1 vase pink and a vase of singles), and Mr. WILLIAM SHORT (twelve blooms, eight varieties; twelve blooms, six varieties, and ladies' Rose spray).

Although deficient in numbers and quality Sweet Peas made a fine show. In the open classes Messrs. TORRANCE AND HOPKINS were first with eighteen and twelve vases of which the best flowers were Magnet, Olympia, Firebrand, Mammoth, Grenadier, Geo. Shawyer and Austin Frederick. The winning six vases in

the open class and the nine vases in the gardeners' and amateurs' sections were provided by Mr. WALTER C. TURNER who had also the credit of staging the best vase in the show. In addition to Austin Frederick which was thus honoured, that competitor staged splendid specimens of Colorado, What Joy, Charming, Avalanche and Geo. Shawyer.

Mr. JAMES SMITH, Darnvel, excelled in the three classes of Carnations, his best examples being Mrs. J. L. Gibson, Maisie Lowe, Gordon Douglas, Hornet and Mary Murray, while Mr. HUGH MCCALL, Linlithgow, had the distinction of winning first prizes in all the seven Pansy and Viola classes for which he had entered.

ROYAL CALEDONIAN HORTICULTURAL.

At the monthly meeting of this Society on July 5 there was a fine display of exhibits, and Messrs. DOBBIE AND Co. were awarded a Gold Medal for Sweet Peas and a Silver Medal for Delphiniums. Mr. GEORGE BALMER, Dean, Edinburgh, was awarded a cultural certificate for Jargonelle Pears, and there were exhibits of Gooseberries from Mr. F. Glass, Murrayfield, and Sweet Peas from Mr. Miller, Edinburgh.

The meeting was an open one, and among the questions discussed were stone-splitting in Peaches, diseases of Strawberries, the qualities of Cauliflower and Broccoli, and steam heating. Mr. W. J. Thomson, president, occupied the chair.

NATIONAL CARNATION AND PICOTEE.

JULY 19.—The annual show of the above Society, which was held at the Horticultural Hall, Westminster, on this date, in conjunction with the fortnightly meeting of the R.H.S., was a comparatively small affair. There were very few exhibitors, though the quality of the blooms reached a high standard of excellence. The Cartwright Challenge Cup was won by Messrs. LOWE AND GIBSON. The flowers were all shown in vases without the support of cards for the petals. An Award of Merit was given to Mr. G. D. MURRAY for a beautiful bright red-flaked yellow ground fancy, which bore no name.

All the first prizes in the open division were awarded to Messrs. LOWE AND GIBSON. These were mostly colour classes requiring seven blooms each of stated shades of colour. Their varieties were Mrs. R. P. Smith, pink or rose; Snowflake, white; Joan Wardale, dark red or maroon; Eldorado, yellow; Grenadier, red or scarlet; Elizabeth Shifner, buff or terra-cotta; Grey Douglas. Any colour not above mentioned: John Ruskin, yellow-ground Picotee; Viceroy, yellow-ground Fancy; Mrs. Edmund Charrington, white-ground Fancy; and Ida Gray, any other ground Fancy.

In the amateurs' classes the quality of the blooms generally was exceedingly good. Mr. JAMES FAIRLIE was first with three white-ground Picotees and showed beautiful blooms of St. Patrick and St. Osbaldiston which latter was the premier bloom. Mrs. OLAF HAMBRO was second. The best three yellow or buff-ground Fancies were Peace Treaty, Lady Shackleton and Mrs. J. L. Gibson, shown by Mr. ARTHUR REYNOLDS, while Mr. FAIRLIE was a close second. Mr. ARTHUR REYNOLDS, showing Evelyn White, Sir Douglas Haig and Maisie Low, was also first with white-ground Fancies, and Mr. FAIRLIE was again second.

The best three yellow-ground Picotees were fine blooms of M. Lennox, Togo and Mrs. J. J. Keen, shown by Miss ELIZABETH SHIFFNER. The Clove-scented Carnations were particularly good. Mr. ARTHUR REYNOLDS was first with My Clove, Steerforth Clove and Rose Clove, while Mrs. OLAF HAMBRO was second.

In the classes for one variety each of a specified colour or type Mr. JAMES FAIRLIE was first with Snowflake, white self; Mrs. R. P. Smith, pink or rose self; Yvonne Thomas, any colour self not mentioned in the schedule; and Mrs. James Fairlie, white ground Fancy. Miss ELIZABETH SHIFFNER was first with Mary Murray, yellow self; Elizabeth Shifner, yellow self; Bookham Scarlet, red or scarlet self; and Mrs. R. P. Smith, pink or rose self. Gordon Douglas, shown by Mr. EDMUND CHARRINGTON,

was the best dark red or maroon self, and Skirmisher, shown by Mr. ARTHUR REYNOLDS, was the best yellow-ground Fancy, while Mrs. A. Brotherston, shown by Miss ELIZABETH SHIFFNER, was the best Fancy, other than white or yellow-ground.

Mrs. H. BROOKES was the most successful exhibitor in the third division and she won first prizes for two varieties of self Carnations, white-ground Picotees, yellow-ground Fancies and any other Fancies. Mr. F. PALMER was first with two varieties yellow ground Fancies, and with Clove-scented varieties. Mr. H. A. KNAPTON was first with yellow-ground Picotees and with self Carnations.

LONDON AND SOUTH OF ENGLAND VIOLA AND PANSY.

JULY 19.—This recently-formed special flower Society seems to have taken the place of the Southern Section of the National Viola and Pansy Society, for it is stated in the schedule of this first show, which was held at the Horticultural Hall, Westminster, on the above date, that the Southern Section of the National Society had transferred to the new organisation the fixture which it had originally arranged.

A comprehensive schedule of prizes was arranged and, although it was only a small show, the Committee may well feel encouraged to continue the fixture, for there were many exceedingly good exhibits of show flowers. While Violas are exceedingly popular garden flowers round about London and elsewhere in the South of England the qualities of this flower and its sister, the Pansy, are not so appreciated as in the North of England and in Scotland where the annual shows are of considerable importance. It is the province of this newest of special flower societies to educate the large show-attending public into the "points" of these flowers. This does not seem to have been fully appreciated by the responsible body, for, so far as we could discover, there were no schedules available for the inquiring visitor, nor did there appear to be any official in attendance ready and willing to impart information, while the exhibitors' cards bore scant information concerning the nature and objects of the various classes. But we have no doubt these matters have been duly noted and, with the experience gained at this first venture, more enterprise will be displayed at succeeding shows.

AWARD OF MERIT.

Pansy Malcolm Milner.—A splendid primrose-coloured variety, which has a neat yellow blotch at the base of each petal, and a broad blue margin. This fine flower was also awarded a Bronze Medal. Shown by Mr. A. E. GERMAN.

COMPETITIVE CLASSES.

The Holroyd Challenge Cup, offered for the best display of Violas and/or Pansies on a table space, which has to be won three times in succession, did not induce the competition such a trophy with a money prize of two guineas would in the north. Mr. WM. YANDELL was practically alone—another attempt was flattered by the judges with the third prize. The trophy and first prize were awarded to Mr. YANDELL for a fascinating display of good blooms which included the following varieties:—Maggie Rutherford, John Adamson, Moseley, Ideal, Mrs. Ritchie, and the beautiful Malcolm Milner which received an Award of Merit. Mr. YANDELL also had an extensive collection of the high merit which we have so often admired at shows in the hall and elsewhere.

In the remaining classes trade exhibitors were excluded, and in these Mr. A. E. GERMAN, Hornchurch, showed many beautiful flowers. His three vases of exhibition Violas, nine blooms of each, were especially beautiful. The varieties were:—Mrs. James Scalley, Lily Stark and Drummer Wilson. Mr. M. MITCHENER was a good second. The best of many exhibits of twelve blooms of exhibition Violas, three blooms of four distinct varieties, were also shown by Mr. GERMAN, and these included Mrs. Walter Nisbett, Archibald Campbell and Rose Bell. Mr. C. LUCKIN was second in this strong

class. Mr. GERMAN was also first with one vase of a yellow-ground, edged, exhibition Viola, showing Mrs. Andrew Stevenson; for one dark exhibition Viola, showing Milton Jumbo; a pan of Fancy Pansies and a vase of yellow Violas.

Mr. M. MITCHENER had the best six vases of exhibition Violas and he included splendid blooms of McEwan, Annie Hamilton and Flora Macdonald. Mr. W. R. CUMMINS was second. Mr. T. WILSON, Neilston, was first with Moseley Perfection in the class for a pan of yellow bedding Violas, where Mr. GERMAN was second, and, showing William Barr, led for a vase of white exhibition Violas, and was second with a pan of Fancy Pansies. Mrs. E. NOBEL, Enfield, won first prizes for six pans and for three pans of bedding Violas with very attractive exhibits. Her varieties included Amy Barr, Kingcup, W. H. Woodgate, Archie Grant and David Beatt.

ANSWERS TO CORRESPONDENTS.

ANTIRRHINUMS AND LOBELIAS DAMAGED.—

G. D. The white patches on some of the Antirrhinum leaves sent suggested that they have been growing in a cold frame or greenhouse and had not been properly hardened off before they were planted out, and then became scorched by the sun. This will soon happen in June or July when the sun is strong for an hour or two. By far the larger number of the other damaged leaves were dark brown or black, the upper surface darker than the under one. Many of them were hard and crumpled without any moisture in them. These symptoms indicate that something has extracted the moisture from the leaves. Some one may have watered them overhead with a strong solution of sulphate of ammonia or nitrate of soda to make them grow; or they may have been dusted or watered with a solution of alum (sulphate of aluminium) to kill slugs. These materials are not exactly poisons, but as they extract the moisture of the leaves the results would be the same. The Lobelias must have been treated in the same way.

APPLE LEAVES SCORCHED.—T. W. S. The scorching might be either spray injury or leaf scorch, but probably the latter. This is not a fungous disease but a physiological disorder, the cause of which is not fully understood. In a good many cases it may be cured by the use of a potash fertiliser for two or three years in succession, sulphate of potash being best for the purpose. The trouble is most common during a drought.

ARBUTUS MENZIESII FAILING.—R. R. S. The shoot of Arbutus Menziesii received for examination has been killed by a species of fungus, but as there was no fructification of the fungus present it is not possible to identify the species. The diseased part should be cut out well beneath the diseased point and the wound covered with coal tar. This may save the living shoots, although there is the possibility that the roots are diseased, in which case the plant is almost sure to die.

CULINARY PEAS.—A. B. J. We believe Nos. 1 and 2 are Pilot, and No. 3, Senator.

CHERMES ON PINE SHOOT.—J. C. A. C. The Pine shoot received for examination is infested by a species of Chermes, apparently *C. pini*. The only means of dealing with this insect pest is to spray the plants several times at intervals of a few days with a suitable insecticide; a good paraffin or nicotine wash will answer very well.

CUCUMBERS FAILING. C. B. The Cucumber fruit sent is suffering from Gummosis, caused by the fungus *Cladosporium cucumerinum*. This disease occurs quite frequently in cold,

wet houses. It will disappear if you increase the heat and keep the atmosphere reasonably dry. Some measure of control may be obtained by dusting the plants with green sulphur, which can be obtained from most fungicide manufacturers. Real control can only be obtained by heating the houses.

FLOWERS FROM A TOWN GARDEN.—A. R., Bermondsey. The Delphiniums were quite good and you have every reason to be proud of the way in which you have grown them in a Bermondsey garden. The Roses, too, were of good size and substance; the variety is Mabel Morse. We were very pleased to receive the flowers from you, and congratulate you upon your success in your "small back garden."

GRAPE SPOT.—A. G. The berries are affected with spot disease, caused by the fungus *Gloeosporium ampelophagum*. Dust the leaves and bunches with flowers of sulphur at intervals of ten days, or spray with liver of sulphur at a strength of half-an-ounce in two gallons of water. Next winter, when the vines are dormant, spray the rods with iron sulphate in solution.

GLOXINIAS ATTACKED BY EELWORM.—C. F. K. It is difficult to free plants from eelworms when once they are infested. We think your best plan would be to destroy all the affected plants and use entirely fresh soil for any new ones introduced.

LILIUM CANDIDUM DISEASED.—C. G. The Lily is attacked by the fungus *Botrytis*. The black bodies on the leaves and buds are sclerotia—resting bodies. Destroy all affected plants and do not grow Lilies in the same ground again.

NAMES OF FRUITS.—J. N. M. The Peach sent for naming was decayed. From its pale skin it may be Noblesse. Dressings of lime or lime rubble are not sufficient to prevent the stones of Peaches from splitting. Good drainage and healthy root action are other important factors, and many experienced Peach growers are of opinion that artificial pollination adds weight to the fruit and often prevents the stones from splitting.

NAMES OF PLANTS.—F. J. 1, *Cotyledon simplicifolia*; 2, *Salvia argentea*; 3, *Celmisia holosericea*; 4, *Teucrium fruticans*.—D. L. *Erigeron philadelphicus*, a well-known plant. —J. B. P. 1, *Calceolaria integrifolia*; 2, *Francoa sonchifolia*; 3, *Erigeron macranthum*; 4, *Rudbeckia speciosa*; 5, *Lychnis coronaria*; 6, *Mimulus cupreus*.—G. B., 1, *Taxodium distichum*; 2, *Cynoglossum amabile*; 3, *Crucianella stylosa*; 4, *Abutilon Sawitzii*; 5, *Pteris cretica albo-lineata*; 6, *P. serrulata cristata*; 7, *Ribes nigrum*.

ONIONS DISEASED.—F. J. B. The larger Onion is attacked by soft rot, a disease caused by bacteria. The smaller one is attacked either by the same disease or by the fungus *Sclerotium cepivorum*. All diseased plants should be destroyed and the effect of a long rotation tried.

PEAR LEAVES BLISTERED.—A. H. B. The galls on the Pear leaves are due to the leaf-blister mite, *Eriophyes pyri*. Pick off and burn the affected foliage, and next winter spray the trees with kerosine emulsion.

PEACH LEAVES BLISTERED.—A. H. B. The Peach leaves are affected with the fungus *Exoascus deformans*. This disease is always in evidence when there is a sudden fall in the temperature, especially when cold winds prevail, but it is checked by an increase of temperature. All affected leaves should be removed and burnt. Spraying the trees with Burgundy mixture just before the leaf buds burst is a preventive measure that has proved very satisfactory; the mixture is rendered more effective if three-quarters of a pint of milk is added to every three gallons, as this addition increases its adhesiveness.

PROPAGATING CLIANTHUS PUNICEUS.—F. J. Cuttings of *Clianthus puniceus* magnifica are easily rooted from May to July, and under proper conditions ninety per cent. of the cuttings will strike. Shoots about six inches in length taken with a small heel of last year's growth, are preferable; they should be prepared in the usual manner by removing a few of the lower leaves and making the heel portion perfectly smooth with a sharp knife. Side-shoots of this year's growth may be used with equally good results if a large quantity of plants is required. In either case, the cuttings should be inserted in pots in a compost containing at least three parts sand and plunged in ashes in a cold frame. As is the case with all soft-wooded cuttings, they need attention at least once daily, shading them from bright sunshine, and occasionally damping them overhead to maintain a moist atmosphere. Rooting usually takes place in about three weeks; the plants should then be grown on in cool conditions and finally hardened.

RASPBERRY CANES FRUITING UNSATISFACTORILY.—M. L. N. The imperfect maturity of the Raspberry fruits is doubtless due to the fact that the canes were derived from a bad stock. Your best plan is to obtain fresh canes of a good variety from a reliable source.

SWEET PEA FOLIAGE TURNING YELLOW.—T. P. and J. N. M. We have seen several instances of the bleaching of the foliage of Sweet Peas, and in almost every case it would appear that the affected plants were those which suffered in some measure from the cold weather experienced earlier in the season. It is obvious that sunshine is not the cause; the trouble may, however, be due to certain of the plants finding too much manure in parts of the trench.

TOMATOS FAILING TO COLOUR.—T. W. S. The lack of colour in the fruits of Tomatos is generally ascribed to the absence of potash in the soil. The deficiency may be supplied by a top-dressing of wood ash or a light dressing of sulphate of potash. In the case of disease, spray the plants with a solution of potassium sulphide.

WALLS OF FLINT AND CHALK.—J. M. B. We do not think that chalk would have sufficient cohesion to enable you to build a wall of flints, unless it were ground by machinery into a condition of mortar, with water added to it. The difficulty could be got over by a handy man to pound up the chalk and then sift out the hard pieces. To six or eight parts of this one part of slaked builder's lime could be added, well mixed and then brought into a condition of mortar by adding sufficient water and working it well with a spade. The pieces of flint could then be embedded in this mortar. In the North of England and in Scotland, earth or turf dikes are built by simply marking off the site of the wall and then digging sods from either side with which to build it. There is thus a ditch on either side, making the dike appear higher than it really is. Only low dikes would be built if Hawthorn is to be planted on the top. Higher dikes are sown with a line of Gorse seeds along the top. Dry stone dikes are built with stones obtained in the neighbourhood or gathered off the fields. Gorse on the top of the wall would give much more shelter than a bare wall. If Hawthorn is preferred the wall must not be very high, because its roots require more moisture than those of Gorse. The dike or wall should be considerably wider at the bottom than at the top, and if well-built, would be practically everlasting if the Hawthorn is kept as a hedge of moderate height. No large growing trees should be planted on the wall because their swelling roots would burst it. Plenty of good soil should be put between the two faces of flint.

MARKETS.

COVENT GARDEN, Tuesday, July 26th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

The improved weather conditions have increased the supply of all outdoor blooms, and for these prices were much easier this morning. Carnations are still abundantly supplied. Plenty of Roses were on sale this morning, but blooms of the best quality are still retaining their prices; outdoor varieties are generally poor in quality and long-stemmed blooms are most in demand. Cornflowers and Delphiniums are generally poor in quality just now. Amongst the Giant Gladioli, pink varieties are considerably more plentiful; Halley and Prince of Wales are arriving in excellent condition. Montbretias are also good in quality and more Gypsophylla paniculata is being offered, including the double variety. The latest arrivals in this department are Statice latifolia and some disbudbed blooms of the white Chrysanthemum Sanctity and some very good spray Bronze Mr. Jack Pearson, while Lavender is increasing in quantity daily.

Large quantities of imported produce, mainly Plums, Gages and Pears from the Continent, are arriving. Some sections report fairly good trade conditions, but no doubt a period of sunshine would materially help matters all round, as the market has been feeling the restricted buying due to the cold and wet weather we have experienced recently. The demand for choice fruits such as Peaches.

Nectarines, Grapes, Melons and Figs is slackening with the end of the London "season." English Apples and Plums have commenced but, of course, quantities are very small at the moment. The last shipment of Apples from New Zealand is now on the way and prices are keeping fairly firm. Forced Beans are now difficult to sell in competition with outdoor French and Runners. Peas keep scarce and dear, while Marrows are abundant and cheap. Mushrooms meet a moderate demand, the warmer weather adversely affecting their condition on arrival. Tomatoes, after a slow demand, are now a slightly better trade. Cucumbers have also shared in the improvement. Black Currants are now not so plentiful and the crop is drawing to a close. Salads are in better demand. Green vegetables sell very slowly, but Green Peas are wanted; good Peas are scarce and dear.

GLASGOW.

Business in the cut flower market continued quiet and prices again favoured buyers. For the third week in succession Carnation supplies were excessive and values reached the lowest levels of the season—9d. to 1/3 per doz. Roses were likewise cheap at 1/- to 2/-, while Sweet Peas were only worth from 2d. to 6d. per bunch. Peach Blossom Gladioli ranged from 4d. to 8d. per doz. spikes and The Bride 6d. to 8d.; Lillium Harrisi averaged 2/- per bunch; Anemones, 6d. to 8d.; Gypsophylla, 2d. to 3d.; Stocks, 2d., large 4d. to 6d.; Morning Star, 2d. to 3d. and Asparagus from 6d. to 1/-.

Although the holiday season is at its height, a fair turnover was experienced in the fruit market. Table Strawberries sold at 10d. to 1/6 per lb., fair qualities 5 1/2d. to 8d.; Red Gooseberries, 6/6 (1/2 bushel), green 4/-, and Sulphur 4d. to 6d. per lb.; Raspberries, 1/-; Scottish Black Currants (picked), 1/- to 1/6; English 7d. to 9d.; red, 7d.; Gages, 14/- to 18/- (sieve); Cherry Plums, 7/6 (1/2 bushel) French Blue ditto, 9/-; Melons, 12/- to 15/- per case; Pineapples, 7/- per box of 12; Muscat Grapes, 3/6 per lb.; Black, 1/6 to 2/-; Sunkist Oranges, 30/- per case; South African, 34/- to 36/-; New Zealand Apples (Sturmer Pippins), 16/- to 19/6; and Canary Bananas 16/- to 24/-; Scottish Tomatoes declined to 5d. to 7d. per lb. at the beginning of the week and recovered to 6 1/2d. to 8d. French William Pears made 9/- per box (48's).

Prices of vegetables generally moved in a downward direction. French Beans were only worth 8d. per lb. as against 1/6 in the preceding week; Cauliflower declined to 2/6 per doz.; Lettuce, 1/- to 1/6; Dutch Turnips, 3/- per doz. bunches, and Syboes, 6d. to 8d. per bunch.

THE LATEST TRADE MARKS.

THIS list of Trade Marks of interest to readers has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

479,064.—Illustration of a caterpillar-like insect, a wreath, top hat, and the word "PESTA" for insect-destroying preparations in class 2.—Hickson and Partners, Limited, 8, Ings Lane, Castleford, Yorkshire. July 13.

SUPPLEMENT PLATE.

Eucryphia cordifolia.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 61.9°.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 10, 10 a.m. Bar. 29.9. Temp. 60°. Weather, Cloudy.

THE returns furnished by our correspondents from all parts of the country, and summarised on p. 131-137, show that the fruit crops are poor, but not so bad as it was feared they would be earlier in the season. It is many years since this country experienced frosts of such severity as those that occurred at the end of April and the beginning of May, when fruit trees and bushes were either in flower or had just formed their tender, embryo fruits. Up to that time the prospects were splendid; the winter had been mild generally, the weather of the previous autumn had favoured the ripening of the wood and development of fruit buds, and growers everywhere looked forward to a bountiful yield. Then, when orchards and gardens were white with blossom, the temperature dropped to below freezing point, and in some places so much as 10° of frost was registered. Fears were entertained that the whole of the fruit crops everywhere had been ruined, yet the surprising thing is that much of it escaped, and it is the more remarkable in view of the great damage done to other vegetation of a reputedly hardy nature. Circumstances which may have contributed to some of the blossom setting were the "strength" of the individual flowers, the relatively dry atmosphere at the time of the frost, and protection from prevailing winds. The damage was greatest in low-lying districts, where the air is always denser and moister than in sites that are elevated;

crops near the ground, such as Strawberries, felt the full effects of the frost, and their early trusses were blackened and ruined. Northern growers appear to have the worst crops, which is not, perhaps, surprising; the returns from Scotland are especially low, for in nearly every case the yields are given as under the average, which may even mean no crops at all. The cold, north-east winds, which prevailed after the frosts were over, completed the ruin, and the weather was sunless and cold until well into June, and it continued cold and wet when Strawberries and other soft fruits were ripening, with the result that the berries lacked flavour and the quality was poor. Among the more interesting facts recorded by our contributors is the behaviour of certain varieties of Apples in different districts. Some report that the varieties Bramley's Seedling and Court Pendu Plat are cropping splendidly, others that these sorts are amongst the worst failures. Why such a vigorous variety as Bramley's Seedling should be so generally a failure in gardens where other sorts are cropping well is difficult to understand, and no one has offered an explanation. It may be that the flowering of this particular Apple synchronised with the frost, whilst the blossom of others was either over or not yet expanded. The fact that frost came so late in the spring is doubtless the reason why the "Wise Apple"—by which name Court Pendu Plat is frequently known—is included by many amongst the barren sorts, while other late bloomers, such as Crawley Beauty, suffered the same fate. This points to the need, especially in private establishments, of growing a fairly wide selection of varieties, of which some are early and some late in flowering, so that if one is damaged by frost the other may escape. The most striking case of precocious fruits escaping damage this season is found in the comparatively good yield of Peaches in England, of which crop sixty growers report average yields and fourteen crops in excess of the average, out of a total of 129 returns. The most gratifying of all is the Apple crop—our most important fruit. It is certainly not too good, but with 111 of our correspondents reporting yields equal to or over the average and only fifty-nine under the average, the early fears of a total failure of the Apple crop have been dispelled. There are compensations, too, for Apples, generally, are of splendid quality and of large size. The trees also appear to be very healthy, although we have noticed a good deal of American Blight in some places. Motoring through south-east Kent during the past week, we were impressed with the excellent crops in the Apple orchards and plantations, and in many parts we saw good crops of Plums and Pears. The latter fruit, however, will be amongst the scarcest of all, as a glance at the summaries on p. 137 will show, the number of returns "under" the average being the largest of all. Plums are but little better, yet we have seen Plum trees this season in Kent and Essex literally breaking down with a superabundant crop. The yield is especially good where the trees were shaded from the early morning sun, and we were not surprised to hear the misinformed state that the damage was done entirely by the sun and not the frost, which is akin to the belief that the thaw and not the frost is responsible for burst water-pipes. Cherries have given by far the best crop among stone fruits, but much of the Sweet Cherry crop was spoiled by the excessive rains when the fruits were ripening. Peaches, as already stated, are fairly satisfactory in regard to yield, but Apricots

are deficient in numbers. Small fruits rarely default, and whether other fruits are plentiful or scarce, our records over long years of evil and of good reports prove that we may depend on Gooseberries, Currants, Raspberries and the others grouped in the category of "small fruits," to give their full share of the fruit harvest—and the present season is no exception. The fears that the frost had destroyed much of the Gooseberry crop were apparently groundless, for we have seen Gooseberry bushes bearing big crops of fine berries in many parts of the country, although we regret to record cases of bad defoliation of the bushes by the Gooseberry Caterpillar. Nuts are not cultivated so generally as the other fruits, but they form an important crop in some gardens, and add variety to the dessert. The yield this year is considerably under the average, only two correspondents reporting an over crop.

Famous Botanists and Plants named after them.—A collection of some two-dozen portraits of famous botanists, with specimens of living plants that have been named after them, has been arranged in Museum No. 3, near the Main Gate, at the Royal Botanic Gardens, Kew. Among the plants—which include rock garden plants and trees—Linnaea, Lobelia, Dahlias and Fuchsias are included. The Dahlia received its name in honour of the Swedish Professor, Andreas Dahl, a pupil of Linnaeus, and the Fuchsia in honour of Leonard Fuchs, a well-known physician and botanist of the sixteenth century and author of the famous Herbal. Lobelia commemorates the name of Matthias de l'Obel, botanist to James I and physician to William Prince of Orange. Heuchera (Alum root) takes its name from Johan von Heucher, a German botanist, and the tropical Bougainvillea from Louis de Bougainville, a French military commander, who served under Montcalm in the American War. Among famous British botanists, after whom plants have been given their generic names, portraits are exhibited of Charles Darwin, Sir Joseph Banks, the Rev. Stephen Hales, Archibald Menzies and Alan Cunningham, Kew collectors, and others.

Male Irish Yew.—The current issue of the *Kew Bulletin* (No. 6, 1927) contains an interesting account of the discovery of the male form of the Irish Yew. Ever since Mr. Willis found the Irish Yew in the mountains of Fermanagh in 1780, this fastigate variety has been known only as a female form, and propagation has been effected by cuttings; indeed, it is probable that all the plants now in cultivation have descended from one of the plants found in Fermanagh—the one planted in the Earl of Enniskillen's garden at Florence Court. The male plants referred to were discovered recently by Mr. W. H. B. Fletcher, of Aldwick Manor, Bognor, who wrote:—"I was going along a footpath leading to the graveyard at North Mundham, a parish between Bognor and Chichester, which is bounded by high hedges, perhaps some ten feet high, in which are some variegated Irish Yews. I gave two of these a tap with my walking stick and was surprised to see a cloud of pollen drift off. These hedges were planted for my late brother, who was Vicar of the parish from 1882-1926, so I suspected whence he got the Yews. In the course of a day or two, it occurred to me to have a look round the Irish Yews in my own shrubbery and there I found three male bushes of the green form and one of the variegated, all about ten feet in height, as well as smaller bushes of the variegated form. My own bushes came from the Barnham Nurseries, Ltd., Barnham, near Bognor, in the planting season 1900-01. No doubt the others came from the same place." As, however, there seems to be no record regarding the stock whence the male plants came, there appears to be little chance of ascertaining the origin of these male Irish Yews. It is of interest to observe that male flowers of the Irish Yew were found on a previous occasion, for the late Dr. M. T. Masters stated in *The*

Gardeners' Chronicle of July 18, 1891, page 68, that he had received sprays of an Irish Yew from Mr. Tillett of Sprowston, near Norwich, bearing "unequivocal male flowers," but whether these sprays were sports on a female plant or from an entirely male specimen was not stated.

Pershore Flower Show.—The forty-seventh annual flower show, held at Pershore, took place on August Bank Holiday, when no fewer than 6,000 people paid for admission. An old English fair was associated with the function, and there were numerous sports competitions. The occasion was of special interest inasmuch as this year coincides with the centenary of the famous Pershore Egg Plum. Mrs. E. V. Butler, Miss M. Huntington, Mr. C. A. Mumford, Mr. S. G. Parkes, Dr. H. M. Savery, Mr. Duncan Gibbs and Mr. E. J. Palfrey were the most successful competitors, the last-named winning a special trophy for the highest number of points in the vegetable classes. There were numerous classes for Plums, and the competition throughout was particularly good, as one would expect in the case of growers in the Vale of Evesham.

Protection of Stonehenge.—Public appeal is being made for the sum of £35,000 for the purchase of land on Salisbury Plain so that the surroundings of this ancient stone circle may be preserved for all time. At present there is a possibility that many of the immediate surroundings of Stonehenge may be utilised for the building of hotels and restaurants, and there is a fear that unless the land can be purchased and placed under the guardianship of the National Trust, it will eventually be studded with all the accessories of a popular holiday resort. The total area of land under consideration is 1,444 acres, and £35,000 is a small amount to secure the preservation of the surroundings of these famous archaeological remains.

Generous Gift to Elgin.—A generous donor, who wishes to remain anonymous, has offered to Elgin Town Council the sum of £1,000 for the purpose of laying out flower beds in the Cooper Public Park. This fine stretch of woodland and meadow was a gift to the City of Elgin some years ago by a gentleman whose name it bears, but its many attractions do not include floral decorations of any kind. This will now be remedied, the intention being to start cutting out beds in which Hyacinths, Tulips and other bulbs will be planted, thus ensuring a fine display next spring. The intention is to provide a seasonal succession of flowers through most of the year. The work has been entrusted to Mr. Thomas L. Mann, who has done excellent work for horticulture in and around the City of Elgin. The proposal is to spend £200 a year for the next five years. Long before the expiry of the period named, the citizens of Elgin will be able to appreciate to the full what they owe to the anonymous donor, as it is intended to have the different plants named, thus serving educational as well as spectacular ends.

Professor Erwin Barth.—Those who have seen and admired the beautifully planned and well-kept gardens and open spaces of Berlin will learn with interest that Herr Erwin Barth, the town's Garden Director, has been appointed Professor at the Technical High School in Charlottenburg. Herr Barth is already teaching at the school, having been placed on the staff in 1921, when horticulture was definitely added as a permanent subject to the curriculum. His nomination as Professor does honour, not only to him, but also to horticulture in general, as it marks a definite advance in the status of the craft. We are sure Herr Barth's friends will heartily congratulate him on this tribute to his devoted and successful labours.

Silver Medal for Agricultural Research.—The Royal Agricultural Society is offering a Silver Medal for a monograph or essay, giving evidence of original research, on any agricultural subject, on any of the cognate agricultural sciences, or on agricultural economics. Competitors must reside in Great Britain or Ireland, and be not more than thirty years of age on September 29 of the present year. The mono-

graph or essay must reach the Secretary of the Royal Agricultural Society on or before October 31.

Plant Protection Conference.—The second International Conference for Plant Protection will be held early in November, 1928, at Rome, and will coincide with the Ninth Assembly of the International Institute of Agriculture. The first Conference was held at Rome in February and March, 1914.

M. H. van Orshoven.—An old friend and correspondent of *The Gardeners' Chronicle*, M. H. van Orshoven, the Director of the Horticultural Department of the Belgian Ministry of Agriculture, is well-known to many British horticulturists, and almost as well-known to French horticulturists as to those of his own nationality. He was born at the little hilly town of Hoevlaert, so well-known as the centre of the Belgian Grape-growing district. Here his father was at one time President of the Grape Growers' Association, an office subsequently held by his father-in-law. M. van Orshoven,

M. H. VAN ORSHOVEN.

senior, was also President of the Brussels Co-operative Horticultural Auction Market, consequently the son, the subject of this notice, was brought up in the midst of active commercial horticultural interests. After his school days he took his Agricultural Degree at the University of Louvain, and later on graduated at the State Horticultural School at Vilvorde. He then came to England, where he studied horticultural methods and horticultural institutions before going to Holland, Germany and France for a similar purpose. Having thus gained very considerable experience and a wide knowledge of horticultural methods in several countries, he returned to Belgium and was at once given charge of the Experimental Station at the University of Louvain. In due course, a Horticultural Division was created under the Belgian Ministry of Agriculture, and M. van Orshoven was invited to join the staff as technical agent, and it was at this time that he became editor of our Flemish contemporary, *De Tuinbode*. At the outbreak of war, M. van Orshoven was sent to England as an official representative of the Belgian Ministry in this country. He acted on several inter-allied commissions, and organised the employment and allotment schemes for Belgians who had taken refuge in this country, and it was for his many services rendered in this and other connections that the British Government awarded him the honour of M.B.E. Many of our readers will remember that during the war period M. van Orshoven edited and contributed to the French page of *The Gardeners' Chronicle*.

After the war, M. van Orshoven was appointed Director of the Horticultural Department of the Belgian Ministry of Agriculture. In the course of his duties he travels throughout Belgium and has entire charge of the Horticultural Education, Horticultural Experiments, and the Phytopathological Service of his country. He also takes a particular interest in commercial horticulture and, through his department, renders excellent service to those who grow fruits, flowers and vegetables for the principal Belgian and foreign markets. We have profound admiration for M. van Orshoven's wide knowledge and delightful personality, and it is with very great pleasure we take this opportunity of publishing his portrait.

Spring Flower Show at Glasgow, 1928.—Messrs. Austin and McAslan have made arrangements to hold a Spring Flower Show at the M'Lellan Galleries, Glasgow, on March 14, 15 and 16 next. A schedule of fifty-nine classes has been prepared, and the prizes will be open for competition by the firms' customers; entries close on March 6, 1928.

Manchester and North of England Orchid Society.—The meetings of this Society for the session 1927-8 have now been arranged. The Committee will sit at 12 noon at the headquarters of the Society, Holdsworth Hall, 90, Deansgate, Manchester, on September 16, October 7 and 21; November 4 and 25; and December 16, 1927; and on January 13 and 27; February 10 and 24; March 9 and 23; April 13 and 27; May 11 and 25; and June 15, 1928, this last date being fixed for the annual meeting.

A Short History of the Pentstemon.—The short histories of popular garden plants, as prepared by Mr. T. Hay, for use in the Royal Parks, add greatly to the interest taken in the flowers themselves. Few people are entirely incurious, consequently when a neat and easily readable notice is placed near a display of Dahlias, Irises or Pentstemons, it attracts attention and the reader thereof obtains information that is likely to excite further interest in the subject of the notice. At the present time Pentstemons are a fine feature of several of London's open spaces, and particularly so in the gardens along the embankment westward of the Victoria Tower, which is such a prominent feature of the Houses of Parliament. The "Short History" accompanying the display is as follows:—"This genus of very ornamental plants was founded by the English physician, John Mitchell, while living in Virginia, in 1741. The name is derived from the Greek, and means five stamens, each flower having five stamens, one of which, however, is sterile. The genus is a large one and contains about 150 species, mostly herbaceous, only a few being shrubby or sub-shrubby, and all are perennial. One species, *P. frutescens*, belongs to north-east Asia, the others are all American, a large number coming from the western parts of the United States and Canada. About sixty species are in cultivation, twenty having been introduced by David Douglas alone from north-west America and California. There are also now many garden forms in general cultivation. These have mainly arisen from *P. Cobaea*, a species discovered by Nuttall and first cultivated from seed sent by Drummond from Texas, and from *P. Hartwegii* (sometimes called *P. gentianoides*), discovered by Humboldt on mountains in Mexico at an altitude of 11,500 feet, and introduced into cultivation in 1828. English as well as continental growers have done good work in producing, mainly from these species, a race of hardy and vigorous plants producing large masses of bloom; a wide range of colour too has been produced, from white to deepest crimson and purple, and the blooming period extends from early July to mid-December. There are two distinct types, one with spikes three feet high and blossoms of large size, and the other of more dwarf and branching habit and smaller though more graceful flowers. The genus *Pentstemon* contains many species of value for garden purposes, such as bedding and border plants, while others are specially adapted on account of their dwarf, compact habits for planting in the rock garden. As a general rule, those

species of taller habit prefer a rather richer soil and enjoy a rather sunny, drier condition, and so secure the best results in freedom of flowering. Of the species in cultivation, the following are of outstanding merit:—*P. Palmeri*, rosy-lilac; *P. spectabilis*, blue purple; *P. centranthifolius*, bright scarlet; and *P. Eatonii*, crimson-scarlet. Among those of dwarf habit are:—*P. heterophyllus*, *P. coeruleus*, a beautiful blue; *P. cyananthus*, *P. Menziesii* and its variety *Scouleri*, all satisfactory plants worthy of a place in every collection. In milder districts, as a wall plant, *Pentstemon cordifolius* is desirable, the scarlet flowers being very attractive. There are still a considerable number of species known to botanists but not yet introduced, which it is to be hoped may soon be brought into cultivation through collectors in their native habitats."

Dahlia Exhibition in Brussels.—The organising committee of the Dahlia Exhibition, which is to be held in Brussels in September in connection with the Jubilee Exhibition has already received many applications for space, both from professional and from amateur growers, including some from France and Holland.

A Dutch Auction in Germany.—At Heidesheim (Rheinhessen), in Germany, an auction market has been formed, equipped with an electric recording dial similar to that seen at Aalsmeer and other places in Holland. This was recently installed, and the occasion was celebrated by a little gathering of notables and those interested. Heidesheim is the first town in Rheinhessen to install such a "clock," and is proud of the distinction thus bestowed upon it.

Picture Postcards of British Orchids.—A fine series of coloured picture postcards illustrating British Orchids is now issued by the British Museum (Natural History), Cromwell Road, S.W. 7., whence they may be obtained in sets of five, the price of each set being 1/—, or 1/1 by post. The different sets are numbered F.16 to F.21 and the Orchids illustrated are as follow:—(F.16).—*Orchis Morio* (Green-winged Orchis); *O. mascula* (Early Purple Orchis); *O. Fuchsii* (Spotted Orchis); *O. praetermissa* (Purple Marsh Orchis), and *O. incarnata* (Crimson Marsh Orchis). (F.17).—*Orchis pyramidalis* (Pyramidal Orchis); *Ophrys apifera* (Bee Orchis); *O. sphegodes* (Spider Orchis); *O. muscifera* (Fly Orchis), and *Neottia Nidus-avis* (Bird's Nest Orchis). (F.18).—*Orchis purpurea* (Lady Orchis); *O. ustulata* (Dwarf Orchis); *O. maculata* (Spotted Orchis—Moor form), *Himantoglossum hircinum* (Lizard Orchis); and *Aceras anthropophora* (Man Orchis). (F.19).—*Gymnadenia Conopsea* (Fragrant Orchis); *G. albida* (Small White Mountain Orchis); *Coeloglossum viride* (Frog Orchis); *Platanthera bifolia* (Lesser Butterfly Orchis), and *P. chlorantha* (Greater Butterfly Orchis). (F.20).—*Epipactis Helleborine* (Broad-leaved Helleborine); *E. atropurpurea* (Small-flowered Helleborine); *E. palustris* (Marsh Helleborine); *Cephalanthera latifolia* (White Helleborine), and *C. rubra* (Red Helleborine). (F.21).—*Herminium Monorchis* (Musk Orchis); *Spiranthes spiralis* (Autumnal Lady's Tresses); *S. stricta* (American Lady's Tresses); *Listera ovata* (Tway-Blade), and *Cypripedium Calceolus* (Lady's Slipper).

Rose Show in Brussels.—The second exhibition of the Belgian Society—alluringly named "Friends of the Rose"—was a great success, and the Brussels Botanic Garden was crowded with visitors. The chief honours were carried off by M. Du Pont, of Ghent, closely followed by the Club known as "Notre Jardin," of which many of the members are ex-soldiers.

Autumn Exhibition in Vienna.—The great success which attended the Spring Exhibition in Vienna has encouraged the Austrian Horticultural Society to plan a flower show to be held in connection with the Vienna autumn fair, from September 4 to 11. The exhibition will comprise plants and cut flowers (warm house, cold house and hardy), decorations of all kinds, fruit trees, vegetables, garden architecture, and sundries.

Appointments for the Ensuing Week.
MONDAY, AUGUST 15: Harrogate and District Horticultural Association's Meeting. TUESDAY, AUGUST 16: Royal Horticultural Society's Committees meet; Clay Cross Horticultural Society's show. WEDNESDAY, AUGUST 17: Bangor Horticultural Society's show (two days); Shropshire Horticultural Society's show; Banffshire Horticultural Society's outing. THURSDAY, AUGUST 18: Royal Horticultural Society of Aberdeen show (three days); Peebles Flower Show. FRIDAY, AUGUST 19: Montrose Horticultural Society's show (two days); Blairgowrie Flower Show (two days); Carnoustie Flower Show (two days); Cupar-Fife Flower Show (two days); Forfar Flower Show (two days); Stranraer Flower Show; Rothesay Flower Show. SATURDAY, AUGUST 20: Charfield Fête and Flower Show; L.M.S. Railway Horticultural Society's show at Manchester; Burnley Horticultural Society's show; Airth Flower Show; Alyth Flower Show; Beattock Flower

the horizon. Though near London, there is not a symptom of its neighbourhood: the trees are as healthy, the foliage as verdant, the grass as clean as in Derbyshire; nor is there any probability of the vicinity being discoverable for years to come—for the hill turns its back to the metropolis, with all Dulwich and Herne Hill between. It is just below the ridge of this hill that the new Crystal Palace is to be placed, with its three transepts at right angles to the ridge; the principal transept will be one hundred feet higher than the old one, and thus the building will become a landmark for miles around. The great fault of the old building was its insufficient elevation, and the long unbroken line of walls. The new situation removes the first of these defects, and the other is effectually cured, not only by the new transepts, but by throwing out two vast wings from the extreme ends of the building and at right angles to it; so that the whole will form a kind of court with three sides, the garden side remaining open.

FIG. 53.—GAULTHERIA HISPIDA.

R.H.S. Award of Merit, August 3. Fruits white. Shown by Mr. Gerald W. Loder. (see p. 118).

Show; Blackwood Flower Show; Broughton Flower Show; Carnwath Flower Show; Inverkip Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Crystal Palace.*—We are now to see what gardening can do when unrestricted by cost and unconfined by such narrow space as it has previously been cramped in. Sir Joseph Paxton has begun the experiment of a park under glass. The Crystal Palace at Sydenham, in which the great Conservatory at Kew would make an aviary, has been commenced in earnest; the plans are decided upon; the workmen are there; levels are made; roads are cutting, mounds are rising, a forest of iron is again invading the ground, and, if the directors of the operation are not mistaken, nine months will bring the whole to a completion. The place that has been selected for this experiment is a hill-side on the borders of Kent and Surrey, close to Norwood, and looking to the south. Than the situation nothing can be more beautiful; from the summit of the hill the eye ranges over a fertile valley; richly wooded and winding along till it fades into

The area of this court is to be an enormous parterre enriched with statuary and fountains. Away from it, right down the hill, stretches a broad walk, terminated by a circular basin, and having on either side a richly decorated garden abounding with pieces of water intermingled with shrubberies, and alive with fountains. The other portion of the ground, forming the park, will, we presume, be converted into a pleasure-ground, where visitors may enjoy themselves as they best like. The interior of the Palace will form a garden of some thirteen or fourteen acres, in which the Palms of the tropics are to contrast with the Orange and Myrtle of milder regions; and the visitor is to stroll among groves of Camellias and Chinese Azaleas. *Gard. Chron.*, August 14, 1852.

Publications Received.—*The Propagation of Hardy Trees and Shrubs*, by G. C. Taylor, assisted by F. P. Knight; Dulau and Co., Ltd., 32, Old Bond Street, W.1; price 5/- net.—*The Book of Bulbs*, by F. F. Rockwell; Macmillan and Co., Ltd., St. Martin's Street, W.C.2.; price 12/6 net.

The Week's Work

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Dwarf Laelias.—Plants of *Laelia pumila* and its varieties *Dayana* and *praestans*, with many hybrids therefrom, are now making new growths, and as young roots are produced from their bases, repotting may be necessary. *L. Jongheana*, which was imported a few years ago in considerable quantity, also succeeds under the same conditions as *L. pumila*, and therefore may be treated in a same manner. These dwarf Laelias are best cultivated in shallow pans suspended near the roof glass, where they will receive a maximum of light, and given a position where there is a considerable range of temperature between the opposite seasons of the year. The small quantity of material sufficient for the plants to root in must at no time be allowed to become dry, and during the growing season water should be liberally supplied; the higher temperature should then be maintained, taking care not to let it fall below 55°. This treatment accords with the climatic conditions under which the plants grow in their native country.

Potting.—When re-potting these Orchids, place a few crocks in the bottom of the pan to ensure good drainage; press the compost firmly and finish off by inserting sufficient heads of living *Sphagnum*-moss to make a nice green surface on the compost when the plants become thoroughly established. *Osmunda* fibre, cut into rather short portions, with a little *Sphagnum*-moss and sufficient crushed crocks added to ensure porosity, provides a suitable compost. As these small plants resent frequent root disturbance, those that have sufficient rooting space for another season's growth, and the compost is in good condition, may be thoroughly cleaned and left for another year.

Watering.—Water should be applied sparingly to the newly-potted plants until the roots become active, when they need a liberal supply as do the undisturbed plants. Spray the foliage lightly whenever the weather is favourable. This treatment should be continued until the plants come into flower and the new pseudobulbs are fully developed; after which they may be kept slightly on the dry-side throughout the resting season, but even then the plants must not suffer for the lack of moisture. These Laelias grow freely during the summer months if suspended from the roof, in a rather humid position in the cool *Odontoglossum* house; but they are best accommodated in an intermediate temperature during the winter. Those few hybrids that are of stronger growth may be placed in pots and be given similar treatment to that afforded *Cattleyas* and *Laelio-Cattleyas* of the cooler section.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

French Beans.—A good batch of these should now be sown in cold frames that have been used for early Potatoes. A dressing of bone-meal should be sprinkled on the surface and well forked into the soil before sowing the seeds. Make the soil fairly firm to promote sturdy growth. Keep the crop as cool as possible to provide late autumn supplies. Seeds may also be sown in pots and treated similarly. Keep the foliage well syringed after hot days, or red spider will quickly appear; a little very weak soot-water may be used occasionally when spraying, as this helps considerably to keep the pest at bay.

Lettuces.—Seeds should be sown during the next two or three weeks, on sheltered borders, for late crops, choosing varieties with a somewhat hardy constitution. Varieties to withstand

the winter, such as *All-the-Year-Round*, *Hardy Hammersmith*, *Black-seeded Bath Cos*, and *Dunnetts' Giant Winter Cos*, should be sown about the third week, and also during the last week of this month.

Spring Cabbage.—The main sowing of this useful vegetable should be made now. Plant out good breadths of *Coleworts* for an autumn supply.

Endives.—Plant these in quantity, but do not crowd them, or rotting will result. Sow more seeds for the latest supply, and for preference, at this date, use the *Round-leaved Batavian* variety. Strong plants with good hearts, should be blanched, using sufficiently large pots for this purpose. Place a piece of slate or tile over the hole, to ensure perfect darkness.

Carrots.—Where frames can be spared, sow seeds of the stump-rooted varieties to provide young succulent roots for use during the greater part of the winter. The crops should be grown as cool as possible, with the lights removed until severe weather sets in.

Cauliflowers.—There should be an abundant supply of good heads during this month. Look over the plot occasionally, and bend the leaves over the heads to prevent the sunlight from discolouring the curds. Should the weather be at all dry, give the bed a good soaking with liquid manure.

Spinach.—Make another sowing to withstand the winter. Sow *Perpetual* or *Spinach Beet* as well as *Prickly* or *Winter Spinach*. Earlier sowings should be kept well hoed, and will prove useful, before the main crop is ready.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brockett Hall, Hertfordshire.

Cyclamens.—Seeds of *Cyclamens* should be sown during this month to provide plants for producing flowers next year. Late sowing is frequently the main cause of failure with these fine plants. Old seeds germinate very slowly and irregularly, therefore it is advisable to purchase seeds of an improved strain occasionally, although it is also a good plan to save seeds from one's own plants that are of exceptional merit. I prefer to sow the seeds in six-inch pots, which must be clean and well-drained. A compost of two parts loam, two parts peat, one part leaf-mould and one part sand is excellent for the young seedlings and for the seed bed. Distribute the seeds evenly and thinly, because better results are obtained when the season arrives for pricking off the young seedlings than when the seeds are sown haphazard. Cover the seeds a little more deeply than is desirable for most greenhouse subjects, and water them in with a fine rose can. Afford shade from bright sunshine and stand the receptacles in a temperature ranging from 65° to 70°.

Schizanthuses.—These are among the finest annuals for growing in pots for greenhouse and conservatory decoration, and the best results are obtained from autumn sowing. Seeds to provide an early batch should be sown now to secure a succession; another sowing may be made during the last week in September. Seeds of *Schizanthus* germinate very quickly, therefore it is not necessary to sow them in heat; the better plan is to stand the receptacles in a cold frame, and so soon as the seedlings appear through the soil, raise the pans close up to the glass to prevent the young plants from becoming drawn and weakly. A light open compost will suit *Schizanthuses*. So soon as the seedlings can be safely handled they should be pricked off into boxes, and grown under the coolest conditions possible.

Clarkias.—These are also excellent annuals for pot cultivation and should receive similar treatment to that recommended for *Schizanthuses*.

Fuchsias.—Where *Fuchsias* are grown and good plants are required for next season, cuttings

should be inserted now in a light open compost; they will soon form roots in an intermediate temperature. If standards are required the plants should be kept growing steadily through the winter months.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD
Wrotham Park, Barnet, Middlesex.

Early Pears.—Several of the early varieties of Pears will soon be ripe. Fruits of the smaller varieties are best gathered and eaten direct from the trees; others should remain for a few days on the shelves in the fruit room. *Doyenné d'Ete* is one of the earliest and in some seasons quite sweet and very pleasant, but if left too long on the trees the fruits become soft and mealy. *Colmar d'Ete* ripens a little later and is a variety worth growing where early Pears are desired. *Beurré Giffard* and *Jargonelle* are also very good in their season, but as the fruits of the very early varieties are quickly over, trees should be planted sparingly. *Williams's Bon Chrétien*, *Clapp's Favourite*, *Dr. Jules Guyot*, *Marguerite Marillat*, *Beurré d'Amanlis* and *Triomphe de Vienne* are all varieties that should be carefully watched, the fruits being gathered at intervals, and a little under-ripe. Trees bearing good crops, especially cordons growing on light porous land, should have their roots thoroughly watered, if necessary; although there have been very heavy rains the roots of all wall trees are very dry beneath, and this fact should not be overlooked.

Figs.—Trees trained on walls are making good growth. Reduce the shoots, if not already done, to a reasonable number, in order to give the fruit a better chance to develop and ripen. The wood retained for next season's crop will also benefit by this full exposure to the sunshine. Shoots not wanted for extension may be shortened, more or less, but those required to fruit next year should not be touched as it is medium, well-ripened wood that bears the most and best fruits. Large, established trees with roots in a somewhat restricted space, and bearing good crops, should be fed liberally with liquid manure or some good concentrated fertiliser.

Early Apples.—A few early varieties will now be ripe and fit for dessert. It is a common mistake to allow the fruits to remain too long on the trees. The fruits of some varieties are best gathered and eaten so soon as picked; others are best when gathered and stored for a brief period. Pick the most forward fruits at frequent intervals. Several early varieties are bearing good crops, notably *Irish Peach* and *Early Juneating*, and these may need some protection against birds.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Frame Melons.—Melons in frames have not had a good time this season, nevertheless the fruits should be well advanced if not actually ripening. Each fruit should be elevated upon an inverted pot to keep it clear of water and so that heat and light may reach it. A few laterals may remain at this stage to assist the fruit and keep the plants in health; as the fruits ripen gradually allow drier conditions about the roots, but the bottom heat should be kept up to the mark, if possible, as by its use liberal ventilation may be maintained. Melons vary considerably in the ripening stage, some varieties being fit for use quickly, whilst others go on improving for several days, hence the advantage of keeping to one or two good sorts and learning to know when they are fit for table.

Late Melons.—A few plants of some free setting variety may be placed into twelve-inch pots for providing a supply of late fruits, the most important consideration being the provision of plenty of top and bottom heat when the crop is swelling and ripening. Plants put out

EUCRYPHIA CORDIFOLIA AT NYMANS, HANDCROSS.

in July will ripen their fruits in September, and seedlings raised at the end of July should carry the supply through October. After the latter date the nights being longer and colder, calculations are apt to be upset, but this should not prevent those who have light and efficiently-heated pits from giving suitable varieties a trial. Of two evils it is better to sow rather early than too late as October Melons come on slowly, but they may be kept in good condition for some time in a warm fruit room. Large masses of compost which cannot be dried and warmed quickly are objectionable, hence the wisdom of using pots, or planting in very narrow pits over bottom heat which can be regulated at pleasure. The most critical periods being the setting and ripening of the fruit, avoid too high feeding and do not allow the bottom-heat to fall at the finish. The best compost for late Melons is strong, friable loam, old lime rubble, a little bone-meal and a dash of soot; on no account should it be rich enough to induce gross foliage. The pots should be liberally crocked and the soil rammed fairly hard. Two fruits to a plant are ample, set on the same day, if possible, and when these are the size of hen's eggs, feeding may be commenced with weak liquid manure, the house damped and the plants lightly syringed and shut up early on fine days.

Pot Vines.—Vines intended for early forcing should receive more airy conditions, especially on fine days. If rooting through the pots is suspected the pots should be disturbed, but it must be borne in mind the roots should never become dry until ripening of the leaves gives the signal for a gradual reduction of moisture. The best preventive of drought is an extra mulch, and at a later date the removal of the first laterals from the base upwards is desirable, as the buds cannot be too well ripened.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Veronica Shirley Blue.—This dwarf, early-flowering Veronica, with its beautiful blue flowers produced in great profusion, is ideal for the rock garden, for edging the front of the herbaceous border, or for planting in quantity as a carpeting for beds of spring-flowering bulbs. Where good stocks exist it may be increased by division; failing this, it may at this time be increased by means of cuttings, which root readily if dibbled into a bed of sandy soil in a cold frame.

Romneya Coulteri and R. trichocalyx.—These, together with the hybrid between them, are ideal for hot, dry situations; they grow and increase freely in poor stony soils, and in such situations are more likely to prove hardy, than when in too rich soil, for, in common with many other Californian plants, damp and stagnant moisture proves fatal to them during the winter. Romneys may be readily increased by means of root cuttings, which should be inserted in pots of sandy soil during August or September, and subsequently grown in pots until planted out, for they do not transplant successfully. When growing in light, stony ground Romneys often run underground, producing suckers which may be detached with pieces of root stock attached; these may be placed in pots, stood in a cold frame, and kept close until they are established.

Dendromecon rigidum.—This is another Californian Poppywort generally regarded as being a difficult subject to propagate. It may, however, be propagated at this season, with every chance of success, by means of cuttings, selecting for this purpose short, twiggy growths about three inches in length. These should be inserted in small pots of sandy soil and stood under a propagating glass in a cool greenhouse. When potting the rooted cuttings great care must be exercised as the plants resent root disturbance. Even in the south *Dendromecon rigidum* is best planted at the foot of a warm wall, while in the colder parts of the country the shelter of a cool house is necessary. The largest specimen I have seen was planted at the foot of and trained up the back wall of a greenhouse.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Vines.—Late Grapes are now colouring rapidly, and more air should be admitted to the houses on all suitable occasions, by opening the front ventilators; a buoyant atmosphere is needed to dispel moisture from the fruits and foliage. The borders must be kept sufficiently moistened at regular intervals, and a close watch kept on all sub-laterals and secondary growths, pinching these back to two or three leaves before they become too prominent. Such growths develop very quickly at this

bug" is troublesome another effort should be made to subdue this pest; use a small brush dipped in methylated spirit, and touch every spot which shows traces of this intruder.

Runner and Climbing Beans.—These are now growing strongly, and it is necessary to stop the leading growths, so that the pods may swell quickly. This is best done when the plants have reached a height of six feet or so, as then sufficient haulm has been made to carry a fair crop, which is as much as can reasonably be looked for in most northern districts. Some varieties of Dwarf French Beans have recently developed a climbing nature, throwing out long, straggling shoots, which twine and sway

FIG. 54.—ROSE BERNICE.

N.R.S. Certificate of Merit, July 1. Flowers peach-pink and yellow. Shown by Mr. J. H. Pemberton. (see p. 36).

season, and if not restrained soon rob the bunches of their full share of sap. For some obscure reason the small, secondary bunches, which are also easily overlooked, present none of those difficulties which the main bunches do in regard to setting; they set every berry and plump up very quickly, but as they are of no value they should be removed so soon as seen. The main leaders which were stopped some time ago are again growing freely, and while not permitting them to become too rampant, they should be allowed a certain amount of freedom of growth, as they form a safety valve, and carry off any surplus sap, thus preventing the splitting of the berries. Where "mealy

around as if reaching for supports; such shoots must be removed and the plants kept dwarf by compulsion, as otherwise they cannot be expected to mature a crop. The variety which has shown this bad habit most with us is the well-known Canadian Wonder, and seedsmen would be well advised to make a more careful selection of this useful type of French Bean. Many splendid varieties of Stringless Beans are now procurable, and these are a great advance on the older varieties, being quite fit to use when of fair size, never becoming fibrous and tough. Those who have not cultivated Stringless Beans should give them a trial next season.

IRISES IN 1927.

THE popularity of the Iris still increases. The first Iris Show on June 2 was a great success; it received a warm welcome from the horticultural press, and hopes were expressed that it had come to stay. If I may judge of the patriotism (if so strong a word is permissible) of the members of the Iris Society by the emphatic way in which they supported the show, their enthusiasm is genuine, for everyone who had anything to exhibit brought it to Vincent Square. Moreover, the support given by the nurserymen was genuinely unselfish as they expressly desired that their exhibits, and very beautiful they were, should have no reward.

At Chelsea, the Irises were hardly so good as usual, but the season was unfavourable, and May 24 is an early date for showing Irises at their best.

The Joint Committee of the R.H.S. and the Iris Society paid four or five visits to the Iris beds at Wisley and diligently examined the plants in flower. Over 800 varieties are now growing there, and they made a fine display. They had been carefully planted and tended, and reflected great credit on Mr. Chittenden and his assistants. In the list* of plants which were given the Award of Merit will be found many old favourites. As much interest is at present being taken in yellow sorts, I would call attention to the three which gained the Award of Merit—Amber, a rich yellow self; Marsh Marigold, and Fro, with yellow standards and crimson falls. Amber is still expensive, but the American variety Shekinah (the mother, I believe, of Amber), not quite so large or so richly coloured, is an excellent variety and may be bought at a moderate price. Personally I look upon it as one of the best flowers in my garden, and it seeds freely.

It would take too long to deal with all the "best" Irises which were to be seen at the Iris Show. Many excellent old and middle-aged varieties were conspicuous. Bruno, Aphrodite, Mdle. Schwartz, Alcazar, Lord of June, Ann Page, Leonato, Asia—all asserted themselves. Among the newer varieties Mary Gibson and Morning Splendour, the new American, were conspicuous; whilst among the absolutely new flowers, Mrs. Dykes' Zaharoon,† which was selected for the Silver-gilt Medal as the best new bearded Iris of the year; Mr. Bunyard's Castor, a much improved Mercedes; and Mr. Perry's Bardelys, particularly attracted me.

I have had the pleasure this year not only of seeing (several times) the great collection at Wisley, but also Sir Arthur Hort's beautiful garden at Hurstbourne Tarrant, where Ann Page, the white Theseus, and the giant, but shapely, Leonato reminded everyone of the great work which he has done for the Pallidas. I have visited, too, Mr. George Baker's new garden at Sevenoaks which is on the way to fame, not only for its almost priceless collection of Irises but also for its alpine and shrubs.

But the outstanding Iris memory of 1927 which remains with me is that of my visit two or three days before the Iris Show to Mrs. Dykes' garden at Bobbingcourt, with its perfection of site and soil. I went there straight from Wisley, with that great collection still before me, and yet the Bobbingcourt Irises awakened in me an enthusiasm which I fear may almost seem excessive. It was a sight to make an old man young—if I may be so old-fashioned as to quote Tennyson.

Such a sea of blossom, such variety of colour, such difference of pose and stature, made the Irises at Bobbingcourt an absorbing study for the expert and a glorious marvel for the neophyte in Iris growing. Mauve and lavender, blue and purple, yellow and orange, pure white and white slightly overlaid with yellow or blue, and intervening shades of all kinds, including pink and cinnamon, demanded attention. Add to the perfection of growth the lavishness of bloom and the pleasant fragrance and one has all the attractions a garden lover can desire.

Among the hundreds of seedlings I may refer to a few which seem pre-eminent.

Zaharoon (previously mentioned). Cinnamon with a violet sheen. The colouring is much the same as that of Mr. Amos Perry's beautiful Mary Gibson, but the bloom is larger and more imposing.

Khama. Standards light violet-bronze; falls rich velvety dark crimson; conspicuous orange beard.

Cupavo. Reddish-lilac, falls darker; very large flowers on very tall stems; massive and imposing.

Beltane. Dusky deep violet, falls darker and velvety.

Akbar. Very dark, perhaps best described as swarthy.

Britoness. Large pale yellow, perhaps a little thin in texture.

Irises other than the bearded varieties were to be seen at Vincent Square on June 2. It was a non-bearded Iris which gained the Silver-gilt Medal of the Iris Society and the Dykes' Memorial Medal for the best new Iris of the year, viz., Mr. Amos Perry's very beautiful cross between *I. chrysographes* and *I. Douglasiana*, called Margot Holmes.

Iris laevigata was much admired. Forms of *I. sibirica* were well shown; the foremost among them being Perry's Blue (which seems to me the best of all), Emperor, and Snow Queen.

To conclude; the third week in August will soon be with us, and between it and the third week in September lies the time when so many experienced growers tell us bearded Irises may be moved most successfully. *G. Yeld, Orleton, Gerrards Cross.*

HARDY FLOWER BORDER.

LIBERTIA FORMOSA.

WHEN visiting Wisley recently I was pleased to see a number of groups of *Libertia formosa*, both on the rock garden and in the wild garden. Although this plant has been in cultivation in this country since 1831, in which year it was introduced from Chili, it has not received the attention it merits.

L. formosa makes a most attractive feature when planted in masses and has the distinct advantage of possessing a most pleasing fragrance. The inflorescence consists of a loosely corymbose panicle upon which a succession of white flowers are produced from May to July. The leaves, springing from the base, are narrow and sword-shaped, they stand erect and close together in a stately clump which makes an excellent setting for the numerous tall flower spikes, and provides splendid protection for the crowns in winter. For this reason it is advisable to let the old and withered leaves remain even at the expense of tidiness. In the northern counties it is advisable to give a little extra protection during hard weather.

Libertia formosa may be raised from seeds in the same way as Irises and may also be increased by careful division of the creeping rhizomes in March or April. It likes plenty of sun and this should be remembered when choosing a site for it in the border or wild garden. *R. K.*

ISATIS GLAUCA.

In this plant we have a pretty Woad, although some people do not care much for it on account of the small size of the individual yellow flowers. But these are produced in such great numbers that a good specimen is more than pleasing and is a real ornament to a border of herbaceous plants, and as it generally flowers from June to August, it maintains its effect for a considerable time. *Isatis glauca* usually grows from three to four feet high, and has pleasing, glaucous foliage and clouds of golden blooms. I may have a special prejudice in favour of this plant as, many years ago, through the goodness of Mr. Edward Whittall, I received seeds from him at Smyrna and raised seedlings. Some plants which I gave to a friend were distributed with my permission, and from these I believe the present stock of plants in this country has been raised. *I. glauca* produces seeds freely and these may be sown in spring. It is quite hardy and has no special requirements in regard to soil, thriving in any good garden compost. *S. A.*

INDOOR PLANTS.

APHELEXIS.

INCLUDED in the group of plants familiarly known as "Everlastings" is the interesting South African genus *Aphelexis*, once much in vogue for greenhouse display and exhibition purposes.

The best known of these Composites is *A. humilis*, also known as *Helipterum humile*, and now referred to as *Helichrysum humile*. This plant has rosy-pink, terminal and solitary flowers on scaly peduncles; the numerous branches are slender, covered with a white tomentum and the habit is dwarf and compact. The flowers open only during sunshine.

Good varieties of this species—once well-known—are *grandiflora*, highly esteemed for exhibition purposes; *purpurea* and *rosea*.

Aphelexis humilis was introduced from the Cape in 1810. It is propagated by cuttings obtained in spring or summer. When re-potting becomes necessary it is best done in early spring. The general treatment desirable for *Aphelexis* is similar to that required by Heaths, although the plant under notice is more easily amenable to cultivation and succeeds admirably in a compost of two parts peat and one part leaf soil, with sufficient silver sand to render the whole porous.

CORREA CARDINALIS.

WHEN well grown, few plants will flower more freely, or over a longer period, than will the *Correas*, and of this interesting family, *C. cardinalis* is one of the most attractive. The flowers are pendant, scarlet, tipped with pale green, and are very persistent. The plants are slender-growing but very graceful shrubs, attaining to a height of from three to four feet. They may be so managed in a cool house that they will give a continuance of blooms from autumn to spring and they are most welcome during the winter months.

Fibrous peat and sand form a suitable rooting medium. After flowering, the plants should be kept in a moderately dry condition and at all times should receive abundance of air and light. Indeed, in the summer they are happier in the open air than under glass. *C. cardinalis* may be propagated from cuttings but is perhaps better grafted upon *C. alba*. This quaint and exquisitely beautiful plant is a native of Australia. *Ralph E. Arnold.*

PRIMULA MALACOIDES.

THIS beautiful greenhouse *Primula* has become very popular in recent years, and by sowing seeds at various times it may be had in bloom over the greater part of the year. I find a batch of *P. malacoides* particularly acceptable in spring, when light and graceful flowers are not numerous. In order to have the plants in bloom at that season it is desirable to sow seeds about the middle of August, in a light compost in a frame or greenhouse. *Primula malacoides* is impatient of heat.

When the seedlings are large enough to handle they should be potted into three-inch pots; in these receptacles they may remain during the winter. Succulent tissues and a very hairy leaf and stem surface in which water collects, render the plants very liable to damping off. It is essential therefore to maintain fairly dry conditions by admitting air whenever the outside weather permits.

In early March the plants should be transferred to five-inch pots which will carry them through the flowering stage. A good potting compost consists of three parts loam, one part leaf mould, one part partially decayed cow-manure, one part charcoal and one part sand. The appearance of the first flower spike is a signal that feeding may profitably begin. For this purpose I find that nothing is more suitable than alternate applications of weak liquid manure and clear soot water. These should be given twice a week until it is obvious that feeding is of no further use.

There are many beautiful forms of *Primula malacoides* on the market but the best known to me is Sutton's Advance which bears deep rose-coloured flowers with cream centres. *Geo. H. Copley, N.D.H.*

PLANTS NEW OR NOTEWORTHY.

THE PINK MARTAGON LILY.

LILIAM SP. (taliense ?), K.W. 6034.

ALTHOUGH this Lily has yet to be determined, it is undoubtedly an acquisition, and will be widely grown as the stock increases.

It was collected by Capt. Kingdon Ward in his 1924-25 expedition to Tibet, and is described by him in his field notes as follows:—"K.W. 6034. *Lilium* sp. (§ Martagon). Tsangpo Gorge, near Gyala, 8,000 to 10,000 feet, 29-7-24. Flowers pink, the perianth segments closely and evenly spotted with purple, very fragrant, just coming into bloom. Plant two feet to three feet, on shrub and Pine-clad slopes. Not common here. Abundant around Tonghyuk on Pine- and Bracken-clad slopes, with the 'Virgatum' *Rhododendron*; in full bloom, scenting the forest. Plant of four feet, bearing twelve to twenty flowers."

The examples exhibited by Lt.-Col. L. C. Messel at the R.H.S. meeting on August 3 (Fig. 55) were from seeds sown in April, 1925. So soon as the seedlings had made a second leaf they were transplanted into five-inch pots, and, later, planted in ordinary soil in the open ground where they continued to grow until autumn. The broad, basal leaves produced at this stage were about six inches in length, and one inch in width. As these withered, sand was placed over the soil surface to keep slugs from damaging the bulbs below.

In the spring, before the main stems appeared, rhizomatous stems were pushed above the soil in the shape of a bow, in the same manner as those of *L. Duchartrei* var. *Farreri*; sandy leaf-mould was placed over them to prevent injury from frost and after travelling a foot or so they emerged again, ascended and are now bearing one or two flowers on short, vertical stems.

From the parent bulbs the main stems appeared later, well clothed with leaves two-and-a-half inches in length and three-quarters-of-an inch in width, those at the apex, at the junction of the peduncle and main stem, being broader and more obtuse.

The buds are brownish pink on the outside, two-and-a-half inches in length, and as they open the segments curl back in true Martagon style. A fully-opened flower is two-and-a-half inches across, rose-pink, paler towards the centre, each segment being distinctly marked on the inside for half its length with a central purple-brown line, and plentifully covered with small spots of the same colour. *J. Comber, Nymans Gardens, Handcross.*

LUPINUS CYTISOIDES.

A FEW years ago Messrs. Barr and Sons first offered *Lupinus Paynei* to their clients. This is a fine, tall plant which reaches a height of four to five feet when well-grown.

Another Lupin is now in cultivation under the name of *L. cytisoides* which is a veritable giant among herbaceous plants, surpassed only in vigour and height by the giant *Polygonums*.

L. cytisoides is a Californian species differing but little in flower and foliage from *L. Paynei* but of gigantic proportions; plants just one year old are already eight feet in height, much branched and bearing many spikes of rose-pink flowers. As a plant for the wild garden or isolated bed on the lawn this Lupin would be a remarkable and handsome feature. It is reported to grow sixteen feet in its native habitat and it is said of it, as was written of the Mustard plant of scripture, "the birds of the air lodge in the branches thereof."

In Bailey's *Cyclopaedia of Horticulture*, *L. cytisoides* is referred to as *L. rivularis* but the figure of *L. rivularis*, in tab. 1595 of the *Botanical Register* is not the *L. cytisoides* now in gardens. In a genus so vast, there being over three hundred species and with distinguishing characters difficult to find, there will always be trouble with names.

IRIS DICHOTOMA.

THIS very old but still uncommon species of Iris is of interest as being the only known member of the section *Pardanthopsis*. Much has been written about this species and coloured figures are given in the *Bot. Mag.*, Sweet's *Flower Garden*, the *Botanical Register*, etc. In *The Genus Irises*, Mr. Dykes describes the species at some length, remarking that it is of value for its habit of flowering in August; also that in bearing so many flowers the plant becomes exhausted and rarely survives a second year.

The flowers open in the afternoon and last

A REVISION OF VIOLAS.

(Continued from p. 28.)

V. hornemannii is, as already stated under *V. canina*, synonymous with the well-known *V. elatior*, which Farrer referred to as *V. canina stricta*.

V. incognita, Brainerd, is the subject of the sweeping assertion that it "deserves no closer intimacy," and is linked with *V. fimbriatula*, *V. sagittata*, *V. emarginata* and *V. renifolia*. The association of these Violets with one another is confusing as three of the five belong to the

FIG. 55.—LILIAM SP. (TALIENSE ?), K.W. 6034.

R.H.S. Award of Merit, August 3. Flowers pink, with deep carmine or purplish spots.

Shown by Lt.-Col. L. C. Messel.

but a short time. I have been unable to find any open flowers in the morning or before two o'clock in the afternoon. The flowers are small, the colour purplish-pink, and the habit of the plant is particularly elegant; the tall, much-branched stem issues from a beautiful fan-shaped cluster of leaves, the whole standing stiff and erect and nearly four feet in height.

Mrs. C. H. Stout of New Jersey kindly sent me seeds of this Iris in February, 1926; they germinated readily. The seeds were said to have been gathered from a particularly fine pink form but they did not seem to have retained this colouring, the plants having blossoms very similar to those figured in the *Bot. Mag.*, tab. 6428.

It is a native of Siberia and China. *T. Hay.*

Leucellata group, while the first and last belong to the *palustris* group, to which also *V. blanda* and *V. pallens* belong. The last two, though not in the front rank of Violets, are dainty and attractive, and the white flowers of *V. incognita* would appear to be not less so. The leaves are orbicular or reniform. It is a species that spreads from Newfoundland southwards over the whole of temperate North America, but as its identity was for long concealed to botanists it was aptly given the specific name *incognita*, which means unknown and unrecognised.

V. renifolia is also a white Violet, spreading from Newfoundland west to the Mackenzie River and south to Colorado and the Rockies, it is near to both *V. incognita* and *V. blanda*, but may be distinguished by the brown

lines on the three lower petals, by the always reniform leaves and by the entire absence of runners. It is in fact said to be the only white Violet that has no runners. It grows in swamps, the station from which it was first collected being a great Sphagnum bog called the "Bottomless Pit" at Hanover, in the region of the Great Lakes.

Following Farrer's order, it may be of interest to write something here, though not in alphabetical sequence, of the three Violets mentioned above belonging to the cucullata group. *V. fimbriatula* is the fringed or Rattle-Snake Violet with purple flowers and very pubescent leaves, from dry fields from Nova Scotia south to Georgia. *V. sagittata* is the arrow-leaved or Spade-leaf Violet with lavender flowers, from moist meadows from the New England States west to the Great Lakes and then south to Louisiana. In places it is very abundant; "thousands of plants," states a collector, "covered the ground with a blue carpet, mostly where the land was a little low and damp." *V. emarginata* is a large-flowered Violet with triangular leaves, from dry woods from the New England States southwards but stopping considerably short of the Gulf of Florida coast. Its specific name was given by reason of its emarginate petals but these are sometimes entire. It certainly appears to be worth closer intimacy.

V. ircuitiana, Turcz., is Regel's variety of *V. variegata*, Fischer. The species is a dwarf, stemless plant, with round or ovate, cordate leaves, dark green above except for the pale green nerves, and violet underneath (whence the name "variegata"), with small dark violet flowers carried above the leaves, white at the base of the petals and with a long pale spur. It belongs to the Patrinii group and hails from mountain slopes in Transbaikalia, Manchuria and Japan. The variety *ircuitiana* differs from the type merely in the leaf formation and that very little, and has been found only near Irkutsk. The red or pale-purple flowers mentioned by Farrer do not appear to belong to this plant.

V. Jooi, Janka, is well known by name but doubtfully in cultivation. It is synonymous with *V. purpurea*, Stev., and with *V. macroceras*, Bunge, the last being the oldest and correct name. *V. purpurea* belongs to the Caucasus and *V. Jooi* to the Alps of Transylvania and both are the most western manifestations of the great Asiatic Patrinii group of which *V. macroceras* is one of the principal species. The type exists in Siberia, the Altai Mountains and Tibet, growing in shady places by river banks, among shady rocks near torrents, in woods in the Caucasus and on limestone rocks and hill-slopes in Transylvania. The plant may be distinguished by the short thick root; by the long leaf-petioles; the blades ovate, cordate and crenate; the fragrant flowers scarcely rising above the leaves; the purple, rose, lilac or white, but never violet, flowers; the rather long spur, the purple dots on the seed capsule and the purple seeds.

V. labradorica, Schrank. The distinctive features of this silvestris Violet are indicated by Farrer, and also previously in these articles under *V. conspersa*. The flowers vary from pale lilac to violet and are sometimes white. It spreads from Greenland and Labrador to the colder and higher places of the New England States and is therefore alpine and subarctic. The *Kew Hand-list* makes *V. canina* var. *Muehlenbergii* a synonym of this whereas it is a synonym of *V. conspersa*.

V. lactea, Smith, is given by Farrer as a pallid form of *V. canina*, but the flowers of typical *V. canina* are both dark and pale violet, white at the base. The real distinction lies in the leaves which in *canina* are either truncate or flatly cordate at the base while those of *lactea*, besides being narrower, are wedge-shaped at the base. As previously stated, *V. lactea* is the representative of *canina* on the Atlantic shores of Europe, being native to Cornwall, Normandy, the Landes district along the shores of the Bay of Biscay, Galicia at the extreme north-west point of Spain, and Portugal (as near Cintra). It has been recorded near Tunbridge and in Surrey, and also (under the

name of *V. canina* var. *dunensis* (near Bourne-mouth. The Tunbridge plant was the prototype of the figure in *Smith's Engl. Bot.* VII, tab. 445, published in 1798, and it would be interesting to know if it still grows where the botanist first named it.

V. lanceolata, L., the lance-leaved or Water Violet, is not a form of *V. adunca* but a distinct species belonging to the palustris group of stemless Violets bearing runners, and more nearly akin to *V. blanda*, *V. renifolia* and *V. incognita*. The white flowers have the three lower petals striped with purple. The plant is small at flowering time but later rises to twelve inches high and is exceedingly profuse of runners. It inhabits bogs and moist meadows and its area extends from Canada through the Eastern States to Venezuela in South America.

V. lancifolia, Thore (*V. lusitanica*, Rouy and Foucauld) has already been given under *V. canina* as a synonym of *V. lactea*.

V. Lapeyrousei is dealt with by Farrer under *V. cenisia* and there with considerable hesitation as to its identity and name. It will clarify the position of this plant if a summary is given of its various synonyms. Originally described in 1813-18 by La Peyrouse, in his account of the Pyrenees, as *V. cenisia*, it was subsequently in 1824 recognised as distinct and described as *V. cenisia* var. *diversifolia* by Gingins in De Candolle's *Prodromus*. In 1848 it re-appeared as *V. cenisia* var. *vestita* in Grenier and Godron's *Flora of France* and again in 1896 as *V. cenisia*, sub-species *Lapeyrousi*, in Rouy and Foucauld's work. From being a variety and a sub-species it has ascended to the rank of species and in 1903 became *V. diversifolia* (D.C.) W. Beker., and at that it appears likely to stop.

As it is intermediate between *V. cenisia* and *V. valderia*, it may be of use to summarise the differences between the three species and incidentally to define the characteristics of each. The leaves of *V. diversifolia* are ribbed, densely tomentose, very crowded, with the blade equal in length to the petiole, the lower ones nearly round or very broadly ovate, the upper ones ovate-oblong. The leaves of *V. cenisia* are plain, not ribbed (except in a few isolated specimens found, e.g., on the Mont Cenis); generally glabrous (becoming less so in its southern area where the Cottian Alps impinge upon the Maritimes); more distant one from another, with the blade approximately one-half shorter than the petiole, the lower leaves ovate, the upper ones generally oblong or rarely lanceolate. The lower leaves of *V. valderia* are nearly round or broadly ovate, the upper ones oblong or rarely ovate or very rarely linear and the whole plant is less pubescent than *V. diversifolia*. The stipules of the first are digitately divided into, usually, three oblong leaf-like segments; those of the second are usually undivided but may have one or two very small lobes at the base of the main, leaf-like segment; those of the third are digitately divided into numerous segments. The stems of *V. cenisia* are short, those of *V. diversifolia* longer, those of *V. valderia* much longer. The sepals of *V. diversifolia* are ovate, those of *V. cenisia* oblong; the auricles of the former large and nearly entire, of the latter not so large and emarginate; the flowers of *V. cenisia* are lilac, those of *V. diversifolia* pale violet, larger and sweetly scented, those of *V. valderia* deep violet. The first carries one or two peduncles on the stem, the second, the same but shorter, and *V. valderia* one to three, rarely four or five, and much longer. The root of *V. cenisia* is very branching, rambling through the scree, that of *V. diversifolia* is less branching while *V. valderia* makes almost a tufted non-rambling plant. Finally *V. cenisia* is exclusive to limestone formations, *V. valderia* is exclusive to granitic (except in one authentic spot only, overlooking the Roja Valley), while *V. diversifolia* is indifferent. *V. diversifolia* is found in the Eastern and Central Pyrenees, on both the French and Spanish sides, on high screes from 7,500 feet to over 9,000 feet where it flowers from June to August. It is curious that no grower has imported this species although many of our alpine specialists have visited the Pyrenees and although *V. diversifolia* is found among other places on several localities well

known to tourists and climbers, such as the Port de Venasque, Mont Carrigou, the summit of Peyresourde, the Pic de Carlitte, and the Monte Serra Negra near Puignat. The attempt to cultivate it would present considerable interest as it is not a lime-lover or lime-hater as the other two kindred species, and while *V. valderia* has been occasionally grown and flowered in England, I know of no record of *V. cenisia* lasting more than a season or so.

V. latiuscula, the broad-leaved Wood Violet, is one of the best of the North American section and the account given by Farrer requires no comment, except that the recorded localities are dry, sandy or gravelly places in open woods, and not rich humus as is suggested by him. The species is more restricted in its area than its congeners—being confined to the district between West Vermont and New Jersey and N.-W. Pennsylvania. The flowers are deep violet rather than Imperial purple.

V. libanotica, Boissier, is given as a smaller version of *V. hirta* but belongs in reality to the small and little known section of *Lignosae*, which includes also *V. chelmea* and is distinguished by the woody rootstock as the sectional name denotes, by being stemless and having small ovate leaves. *V. libanotica* makes a small caespitose plant, with coarsely-toothed leaves which are wedge-shaped at the base (cordate in *V. hirta*). The flowers are pale violet or white on peduncles as long as the leaves and have a long slender spur. The species is native to limestone soil in alpine and subalpine regions of the Lebanon in Syria, as on Mount Hermon.

V. linguaefolia, Nuttall, is described as a distinct species but is in fact synonymous with *V. Nuttallii*, Pursh. *V. linguaefolia* was originally described as a form with elongated root leaves, but as the leaves of typical *V. Nuttallii* have the blades lanceolate or ovate-lanceolate, tapering into channelled petioles, the distinction between species and form can scarcely be maintained. *E. Enever Todd*.

NOTES FROM A WELSH GARDEN.

MUTISIA DECURRENS has flowered exceptionally well this season. About a score of the very large, fiery orange blossoms were expanded at the same time and the effect was a of colour display of remarkable brilliancy. Owing to the persistent and heavy rains of July it seemed at one time as if the blooms would perish before being fully developed, so long were they waiting for the sun in the half-opened, expectant state. This was the fate with many of the *Cistus*, more especially with the large-flowered kinds. *C. ladaniferus* in particular suffered badly and its lovely, pure-white form, immaculate, failed to open at least one-third of its buds.

Maurandia Barclayana, a Mexican climber, I have always treated as an annual, but some of last year's plants which had escaped the autumnal clean-up survived the winter and came into bloom by the middle of July. These are growing against a south wall and are now about six feet high, all but the lower parts of the stems being densely furnished with the pretty, arrow-head leaves and large Foxglove-bell flowers of a rich violet with a white throat.

Gaultherias have fruited very well this season, none bearing a more attractive crop than the little *G. trichophylla*. The oval or elliptical berries of this very dwarf Himalayan species are enormously big for the size of the plant and of a vivid Wedgwood blue. There is nothing more delightful in the round of one's garden year than the discovery of these berries, all nestling among the delicate, heathy foliage, like so many china beads. Nearly as tall as *G. Shallon* are *G. Hookeri* and *G. Veitchiana*, their clusters of fruits, each the size of a Pea, ranging in colour from a pale, livid blue, almost white, to something approaching indigo. The finest of the white-berried *Gaultherias* grown here is one bearing the name of *G. pyrolaefolia*,

the bunches and individual fruits being much larger (as are the foliage and flowers) than those of a closely-allied species more often seen (probably *G. cuneata*).

The large, densely-clustered, bright cherry-red berries of our native Cowberry (*Vaccinium Vitis-Idaea*) are by no means unwelcome at this season, especially in woodland or where the little shrub can spread without interfering with other things. This and *V. corymbosum*, a much taller, deciduous species, which is good in blossom, fruit and autumn colour, are, if not the choicest, perhaps the most generally satisfying of their race in this garden.

Growing in the woodland with the above and other Ericaceous plants is a well-established clump of *Deinanthus coerulea*, now opening the first of its beautiful lavender blossoms. These blooms, nodding from a stem about nine inches in height, have a superficial resemblance to those of an *Anemone* of the *Allenii* type, but the texture of the flowers, their satiny sheen, cool, wan tint and the silver-grey of the prominent wreath of anthers are peculiarly their own and surpassingly lovely.

One of the most striking objects in a mixed border is a mass of *Lobelia Tupa*, nearly six feet high and as much across. The stately stems of this noble old plant are amply furnished with sage-green, Mullein-like leaves with a red mid-rib and they terminate in bold spikes of glossy, dark-crimson flowers. *L. Tupa* is quite hardy with me and is never given any protection. *L. Cavanillesii* (*latifolia*) on the other hand, we very nearly lost altogether last winter.

Mitraria coccinea, the Mitre-flower, has done fairly well this year, the pure scarlet, urn-shaped blossoms, one-and-a-half inch long, never failing to attract attention by the brilliance of their colour. But this is one of those shrubs which cannot be relied upon to do so well here as it does in the south-west; with it we have to be thankful for moderate returns. *Tropaeolum speciosum*, trailing over some Azalea bushes, is another Chilean, but one that we can always depend upon for any amount of colour from July to October. Albeit, in the splendour of its wonderful blossoms, *Desfontainea spinosa* can easily eclipse any other flowering shrub or plant in the garden or woodland during the later summer, and this year the bushes are bearing an exceptionally heavy and gorgeous crop.

It would be difficult to decide whether Chilean or Californian shrubs are the more successful in this part of Western Britain. Both do admirably on the whole and individuals, among the latter at any rate, are more floriferous than they are in their own country. *Fremontia californica*, for example, has been ablaze with such quantities of its golden goblets, every twig to the tips of a ten-foot specimen being closely crowded with them for five or six weeks, that they entirely hid from sight every vestige of foliage. In its own way this magnificent shrub is quite as impressive in its amazing brilliance as *Desfontainea*. Speaking generally, however, the shrubs of Chili and California enjoy rather different treatment respectively. Here at any rate the Chilean ask for a soil that is cool and rich and often appreciate a north aspect; the Californian enjoy a poor, stony root-run and all the sun they can possibly get.

Cotoneasters here bloomed with unusual freedom and promise a great crop of berries. These latter were very striking on *C. praecox* (closely allied to *C. adpressa*) as early as the first week of July, and at the same time the red-berried Elder, *Sambucus racemosa* was affording a touch of autumnal colour with its brightly-clustered panicles of scarlet fruits.

Among the Sedums of the season *S. pulchellum*, by the waterside, still maintains its reputation as one of the worthiest of its race. In the rock garden *S. amplexicaule* has enlivened its apparently withered foliage by putting up clusters of lemon-yellow blossoms which will be followed by the glaucous-blue leafage which is such a delightful feature of this Stonecrop in winter. Though not perhaps a showy plant, *S. pruinaum* adorns the tips of the tall, slender stems which rise from the ends of its runners, with wide-rayed stars in a singularly vivid yellow. *S. Prae-*

gerianum always strikes a note of distinction with the rosy flowers which fringe the margins of its almost flat, cart-wheel rosette. This Tibetan species promises to be a most useful rock-garden Stonecrop with a character all its own. Near this I have *S. oaxacanum*, a Mexican. This is a more recent arrival, and one that has not been put to a prolonged test in the open, but it is now showing promise of blossoms.

Potentilla nitida, whose rose-pink blossoms have such a telling setting in the silvered foliage, is flowering cheerfully in the moraine. On a dry ledge *Acantholimon venustum*, its neatly-round cushion nearly a foot across, gives somewhat the same attractive blend of soft-pink and steely-grey. *Genista horrida* is here, also, its bristly spines set with showy flecks of gold, and

TREES AND SHRUBS.

VERONICA MATTHEWSII.

For cultivation in pots in an unheated or cool greenhouse, this New Zealand Veronica (Fig. 56) is a useful and most attractive plant. It should be a welcome addition to southern and western gardens. So far, it is proving a valuable addition to our shrubbery borders for summer flowering, but we have not had a severe spell of frost during recent years to test its hardiness for general planting.

A native of several localities, in the South Island, *Veronica Matthewsii* is named in compliment to the late Mr. H. J. Matthews, for some

FIG. 56.—VERONICA MATTHEWSII.

close by it is the lichenous film of *Raoulia subsericea* peppered with the mustard-yellow of the tiniest flower in the garden.

The true *Veronica Bidwillii*, covering a square foot with its dense mat of glossy green, is very delightful, its dainty flights of white, pink-veined flowers held erect on extremely slender, six-inch stems. *V. spicata alpina* (*nana*) is another choice, dwarf, Speedwell which at this season covers its deep green carpet of leafage with little, cone-shaped spikes of violet. Nor can I pass by the fragile loveliness of the purple-starred *Campanula arvensis* and the very satisfactory *C. Jenkinsae*. The origin of this last appears to be unknown but it is one of the best of white sorts of its own stature (six to nine inches) the habit being sturdy and upright, the bells large and of good texture. *A. T. Johnson, Ro Wen, Conway, N. Wales.*

years head of the New Zealand Forestry Department. He cultivated many little-known native plants in his garden at Mornington, near Dunedin, and took an active interest in promoting a knowledge of the New Zealand flora.

V. Matthewsii is a spreading bush, two feet to four feet in height and as much in diameter. The oblong, or elliptic-oblong leaves, three-quarters to one-and-a-half-inch long, and one-third to two-thirds-of-an-inch broad, are sessile, closely and formally arranged on the branches. They are entire, thick and coriaceous in texture. The racemes of white or purplish-white flowers, two to four inches long, grow from the axils of the leaves towards the ends of the branches. The individual blooms are one-quarter to one-third-of-an-inch in diameter.

It is readily increased by cuttings and produces seeds freely. *A. O.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

EUCRYPHIA CORDIFOLIA.

THE Supplementary Illustration accompanying this issue depicts a specimen of *Eucryphia cordifolia*, growing in the gardens of Lieut.-Col. L. C. R. Messel, O.B.E., at Nymans, Handcross, Sussex. The tree was planted in 1905, when about one-and-a-half foot in height, and grew away freely from the start, flowering for the first time when about ten feet in height. In 1916 it was eighteen feet high, and about eight-and-a-half feet through. In its earlier stages protection was afforded each winter by a "wigwam" of poles and mats left open on the sunny side.

The illustration is from a photograph taken in 1926 when the tree was again measured, its height being thirty-one feet and its spread ten-and-a-half feet. The specimen flowers freely, being usually covered each year in August with its snowy white blossoms, and it is probably the largest tree of its kind in this country.

In Sussex the seeds require fifteen months to mature; it follows, therefore, that the still tender capsules are exposed to the frosts of winter and are often partially or wholly destroyed when the winter is exceptionally severe. The seeds drop out of the expanded husks in November and if sown in a temperature of 50° to 60° they germinate readily. Having raised many hundreds, we know that there is considerable variation in the constitution, hardness and growth of individuals raised from seeds; some are inclined to be bushy, while others at once assume a tree-like habit.

The specimen illustrated was one of the parents of *Eucryphia* × *Nymansay* (A.M., R.H.S., 1924; F.C.C. and Cory Cup, 1925). As a large plant of *Eucryphia pinnatifolia* was growing near, the fondness of honey bees for the pollen and nectar probably brought about the cross and gave us this beautiful natural hybrid.

Writing of the species generally Mr. W. J. Bean, in *Trees and Shrubs Hardy in the British Isles*, states, "More tender than *E. pinnatifolia*, this species has never obtained a good footing in gardens, and is only adapted for places where the conditions are favourable." He also mentions that it attains an

height of thirty feet or more in its native habitat.

According to recent exploration in the Andes, this would appear to be a very modest estimate. The smaller illustration (Fig. 57) is from a photograph—taken by my son, Mr. H. F. Comber, during his first expedition to the Andes—of a tree about ninety feet in height, growing at an altitude of 1,500 feet. During the second expedition, just completed, it was proved that even the above dimensions are by no means

DIALYSIS OF CALYSTEGIA SEPIUM.

At the present time the Bindweed of the hedges is highly conspicuous for its large, funnel-shaped blooms, white flowers and pink ones occasionally appearing in similar situations. I have specimens in which the constituent parts of the corolla have become separated, more or less, from one another.

In one case the corolla is divided to the

FIG. 57.—EUCRYPHIA CORDIFOLIA.

A specimen about 90 ft. in height; from a photograph taken by Mr. H. F. Comber during his 1925-26 Andean Expedition.

exceptional, as trees with trunks three feet to four feet in diameter, and from 90 feet to 120 feet in height, were found at the more usual elevation of 1,000 feet where this species forms half the forest. It is also the chief honey-producing plant, the product being sweet, and of good flavour.

The timber, hard and durable, is chiefly used for firewood, because it is not so easily worked as that of *Nothofagus procera* and *N. obliqua*. J. Comber, *Nymans Gardens, Handcross*.

middle in two unequal pieces; in another case it is divided into three unequal pieces, almost to the base. A third flower has all five original petals separated to within one-quarter-inch of the base. This is comparable in a measure to the flowers of *Campanula rotundifolia soldanellae-flora*, but in that case the dialysis is fixed or permanent. These erratic flowers of *Calystegia* were gathered by Miss Willmott, on ruins, at Chester, probably the ruins of St. Peter's Church, but this condition may only be occasional, as it is uncommon. J. F.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP ;
AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 121.

NOTICE OF BOOKS.

A Bird Book.

Most gardeners must, at various times, have wished for a handy book which would enable them to readily identify some uncommon bird seen in the garden or woodlands. Quite a number of reliable books, dealing with British birds and containing good coloured illustrations, have long been in circulation, but for the most part, these are of the nature of library books, as well as being too expensive for the average gardener, who has but little more than a passing interest in the correct nomenclature of the feathered inhabitants and visitants of the garden.

It has remained for Mr. Edmund Sandars to supply the little bird book* so many of us have long needed.

In the preface to *A Bird Book for the Pocket*, he tells us that this book was written for his own use and published in the belief that others may need what he wanted, that is, a book small enough to be carried in the pocket, with a clear text, and accompanying drawings sufficiently accurate in outline and colouring to enable the bird so depicted to be readily recognised. In this Mr. Sandars has succeeded admirably.

The limitations of a book of pocket-size might have presented great difficulties in the matter of uniformity of illustrations, but Mr. Sandars has cleverly overcome this by drawing all the small birds at one-half natural size and the large birds at one-fifth their natural size. With the very large birds—the Swan, Gannet, Cormorant and the like—the head, neck and sufficient of the body for identification have been drawn at the one-fifth scale, accompanied by a small inset of the whole bird. These wholly admirable illustrations are on the same paper as the text and over two hundred birds are thus depicted.

There is also a valuable chapter on eggs, many of which are illustrated in colour. The necessary index, which has been compiled with care, contains many local and alternative names and a glossary of many technical terms used. In a footnote Mr. Sandars has thoughtfully given a short selection of obsolete sporting terms, which, as he states, are worthy of record for their picturesqueness alone. What could be more delightfully expressed than "A murmuration of Starlings," "An exaltation of Larks," "A building of Rooks," or "A dale of Turkeys?"

FRUIT REGISTER.

GOOSEBERRY LEVELLER.

THIS fine variety has always been regarded as one of the "big" Gooseberries, and Dr. Hogg, in his *Fruit Manual*, states that in 1864 individual fruits reached the weight of 30 dwt. 11 gr. It is, of course, a splendid show Gooseberry, but fortunately it is more than that and has increased in popularity because of its free-setting habit and regular and abundant cropping. At one of the recent meetings of the Royal Horticultural Society, Mr. J. C. Allgrove exhibited a wonderful collection of Gooseberries, including many well-grown plants showing the habit and cropping capacity of the varieties. Few, if any, of the plants attracted more attention than those of Leveller, one of which is illustrated in this issue (Fig. 58, p. 139).

The fruits of Leveller are naturally large and if the crop is thinned when the berries are green and just large enough for culinary purposes, the remaining fruits will reach a large size and become useful for dessert. The fruits are yellowish-green when ripe, of fine shape and very good flavour, and although a trace of downiness is found on some of them, they are practically smooth.

Ripe fruits of Gooseberry Leveller have

recently been placed on the market in considerable quantities, and their attractiveness in shop windows and on fruit stalls has drawn attention to a commodity that is at once cheap and good. This should stimulate the cultivation of dessert Gooseberries in small private gardens, and novices who start with bushes or cordons of Leveller are not likely to be disappointed with the results.

Gooseberry Leveller was raised by Mr. J. Greenhalgh of Ashton-under-Lyne, and introduced to cultivation so far back as 1851.

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

Treatment of Golf Greens.—As we took a prominent part in teaching the greenkeepers in the United States how to grow fine turf—in fact, the first really good putting greens in the United States were produced from our seeds under our direct supervision at The County Club, Brookline, Mass., nearly twenty years ago—perhaps we may be allowed to refer to the article on Golf Greens in your issue of July 23. The Americans do keep their putting greens in good condition, but rather than state that their excellence is based on what you claim to be a discovery—that fine grasses thrive best in an acid soil—we would rather suggest that it is based on the fact that they are cultivated to a very high standard, and probably the average American club spends more in a year on the cultivation of one green than the average British club spends on the whole eighteen. There is nothing very new about the use of sulphate of ammonia. It is a highly nitrogenous fertiliser, and we are rather of the opinion that the effect it has on turf is in spite of the acid effect it has on the soil, rather than because of it. If it is the acid effect it has on the soil which gives such wonderful results, rather than its nitrogenous contents—by which it is valued—would it not be possible to obtain the same results by other and cheaper means. Does the experiment at Stoke Poges prove anything other than fertiliser is good for grass? One plot was well fed with sulphate of ammonia at the rate of five pounds to 1,000 sq. ft., or roughly two cwt. to the acre, at fortnightly intervals, another was dressed with sand, and a third with nothing at all. Is it surprising that the well-fed patch thrived and the starved plots stood still? As a matter of fact we have advocated the system of fertilising grass on the principle of "a little and often" for years. The same results could be obtained by using any nitrogenous fertiliser, acid or neutral, and we suggest that it is not fair to stress the presence or absence of acid—the very finest grasses will thrive on acid and neutral soils—and ignore the nitrogen which is really doing the work. The crux of the whole experiment is carried in the passage which reads:—"This interim report of the results at Stoke Poges would appear to show that where water is available our greens and lawns may be improved rapidly by successive dressings of sulphate of ammonia or other "acid" manure. (The italics are ours.) Exactly; when turf is watered and fed it is obvious that it will thrive, whereas if it is not watered and fed it may not. In the United States all putting greens are watered and fed regularly, but in this country very few get either one or the other. If the British greenkeeper, gardener and farmer would fertilise and cultivate their crops properly we would hear less about bad crops and hard times. James Carter and Co., Raynes Park.

Apples as Roadside Trees.—I should like to suggest the planting of Cider Apples as roadside trees in suitable districts. Nothing could well be more ornamental when in flower or fruit, and the return—at the present price of Cider Apples—should be quite substantial. Pilfering would be slight if small, unpalatable varieties were used and these are commonly the best for Cider. H. A. Smith Spark, Burnham-on-Sea, Somerset.

SOCIETIES.

HANLEY FLORAL FETE.

NOTWITHSTANDING the unfortunate weather on the opening day, the twenty-ninth annual floral fete held at Hanley Park was a great success. The exhibition was opened by the Duchess of Sutherland, who made a special journey from London to attend the function, over which the Mayor of Hanley, Alderman W. Walker, presided. One of the most interesting features of the show was the children's section, which included no fewer than 1,800 entries of wild flowers, grasses, drawings and paintings.

Messrs. JAMES CYPHER AND SON secured the first prize for a group of flowering and foliage plants arranged on a space of 300 square feet. They were equally successful for a group of non-flowering plants and for twelve table plants. In these three classes Mr. W. A. HOLMES gained the second prizes, but was awarded chief honours in the class for six plants in bloom and six foliage plants. The special award and first prize for a group of aquatic plants and flowers arranged in a pool, were won by Messrs. CALDWELL AND SONS of Knutsford; Messrs. L. POINTON AND SON, Biddulph, coming second, and Mr. F. DREW, Walsall, third.

Messrs. W. LOWE AND SON, Chesterfield, secured the Silver Cup and first prize for a collection of cut Roses arranged on a space sixteen feet by four feet, and contributed a very fine display of clean, fresh flowers; Mr. G. W. BURCH, second. Messrs. JARMAN AND CO. were particularly successful in the Rose classes, securing first prizes for thirty-six Roses, twenty-four Roses, nine distinct perpetual-flowering Roses, and twenty-four Hybrid Tea varieties. Mr. G. W. BURCH was second in the two first classes, and gained first prizes for five baskets of cut Roses, for twelve white Roses, for twelve pink Roses and for twelve red or crimson Roses.

Messrs. W. LOWE AND SON excelled for hardy perennials, and Messrs. C. ENGELMANN, Ltd., for a display of cut Carnations, while Mr. G. ASTBURY, Crewe, was the most successful exhibitor of Sweet Peas, with Mr. A. J. BLAIR, Congleton, a good second.

Floral decorations are invariably an attractive feature at Hanley, and on this occasion the best dinner table decoration, restricted to Roses, was the one contributed by Mr. A. J. BLAIR, the second and third prizes falling to Sir GEORGE KENRICK (gr. Mr. J. Macdonald), Edgbaston, and Miss HALLIDAY, Congleton, respectively. In the class for a table decoration where any kinds of flowers could be used, Sir GEORGE KENRICK carried off the premier honours with a delightful arrangement of Orchids, Gloriosa superba and Gesneras. Miss HALLIDAY was awarded second prize for an arrangement of pink Carnations, and Mr. E. WHITE, Newcastle, was placed third for a table of Sweet Peas.

Non-competitive exhibits were numerous and of high quality. The Shirley Cup offered for the best exhibit in the show, was won by Messrs. JAMES CARTER AND CO. with a very fine exhibit of vegetables of excellent quality and great variety. Messrs. E. WEBB AND SONS were awarded a Large Gold Medal for their exhibit of Sweet Peas, annual Chrysanthemums, Sweet Williams, Irises and other flowers. Messrs. A. G. LEIGHTON, LTD., received a Small Gold Medal for a fine display of Sweet Peas, Poppies, Delphiniums and other border flowers. Silver Medals were awarded to Messrs. BAKERS, Mr. A. GRESHAM COPELAND, Tittensor Chase, and to the MOUNTFORD GARDENERS' ASSOCIATION, Penkhull.

KING'S WALDEN HORTICULTURAL.

THIS twenty-seventh annual show, favoured with one of the few sunny days of the year, was held on Wednesday, August 3, in two spacious marquees. The pleasure grounds of King's Walden Bury were open to visitors and this, no doubt, helped to increase the number of visitors, which reached 3,500.

In the open class for Sweet Peas, Mrs. H.

* *A Bird Book for the Pocket*. By Edmund Sandars. Published by the Oxford University Press, London. Price 7/6 net.

DUNHILL (gr. Mr. Howard), Harpenden, was placed first; A. O. FANE, Esq. (gr. Mr. A. Gilling), Kimpton, Hoo, second, and Mr. E. SUTTON, Brenchwood Green, third. A. O. FANE, Esq., secured first prize for a meritorious collection of vegetables, while Mrs. CREASY, Hitchin, led for a display of hardy perennials. R. D. OLDHAM, Esq. (gr. Mr. K. Kellaway), secured the premier award for a similar exhibit in Division B. Mrs. CREASY led for a table decoration; Miss INGRAM, Kings Walden, second; and Mrs. GOLDIE, London, third.

The amateurs' and other classes were all well filled.

Trade exhibits were very effective. THE KIRKWICK NURSERIES Co. arranged a rock garden which attracted a good deal of attention; Messrs. WM. CUTBUSH AND SONS displayed a large group of herbaceous plants; Mr. R. CANNON, Hitchin, had a miscellaneous group that included fine Gladioli; Messrs. R. HARKNESS AND Co., Hitchin, displayed fine Roses, and Messrs. WHEELER AND SON also had an attractive display.

THE HERTS COUNTY COUNCIL (Oaklands Institute) filled one end of a tent with examples and drawings of plant diseases.

Mr. W. G. P. Clark (who acts in a similar capacity for the Hitchin Chrysanthemum Society) and Mr. A. J. Hartless again acted as Secretaries.

ROYAL LANCASHIRE AGRICULTURAL.

On the occasion of the exhibition of the Royal Lancashire Agricultural Society, held at Bolton on July 28, 29 and 30, the horticultural section was an interesting feature, and the numerous excellent exhibits were arranged in one large marquee. A dozen classes were provided, and in the principal one for a group of miscellaneous plants arranged for effect on a space not exceeding 300 square feet, the premier award was won by Messrs. J. CYPHER AND SONS with one of their characteristic displays of flowering and foliage plants; second, Mr. W. HOLMES; third, Mr. T. PETCH. Messrs. HERD BROS. secured the first prize for a display of Sweet Peas arranged on a space 20 feet by 5 feet, and they put up an excellent exhibit; second, Mr. W. SCOTT-STYDEL; third, Mr. R. CHALLINOR, Crewe.

Messrs. R. BOLTON AND SONS' prizes for twelve bunches of Sweet Peas, distinct, were won in the order placed, by Mr. H. BROOKSHAW, Crewe; Mr. W. A. WESTON, Keighley; and Mr. NORMAN BELL, Carnforth, while in the class for six bunches of Sweet Peas, Mr. F. O. HAYWARD, Darwen, was placed first, followed by Mr. W. A. WESTON and Mr. NORMAN BELL. The best bowl of Sweet Peas was contributed by Dr. J. ROY (gr. Mr. Falconer), Cheadle Mental Hospital; second, Mr. W. ROBINSON, Garstang; third, Mr. F. EMMOTT, Lancaster.

Mr. T. ROBINSON, Nottingham, put up a very fine display of cut Roses on a space twenty feet by five feet, and not only showed good Roses, but arranged them in a very pleasing manner. He was awarded the first prize and Messrs. BEES, LTD., the second. The last-named firm excelled in the class for a collection of hardy perennials with a group of very fine flowers arranged on a ground space 30 feet by 10 feet. The other prize winners in this class were Messrs. W. ARTINDALE AND SON and Messrs. GIBSON AND Co.

In the vegetable classes the produce was particularly good, and the principal prize winners were Mr. W. ROBINSON and Mr. FALCONER.

The most meritorious non-competitive exhibit was the handsome group of magnificently-grown Begonias staged by Messrs. BLACKMORE AND LANGDON, to which the Royal Lancashire Society's Gold Medal and also the Gold Medal of the Royal Botanical and Horticultural Society of Manchester were awarded.

Other Gold Medallists were Messrs. SUTTON AND SONS, for Sweet Peas and other annuals; Messrs. ALLWOOD BROS., for Carnations and Pinks; Messrs. HEWITT, LTD., for Delphiniums; Messrs. TOOGOOD AND SONS, for Gladioli and border flowers; Messrs. LITTLE AND BALLANTYNE, for topiary work and Conifers; while Silver Medals were awarded to Messrs. BAKERS,

for hardy flowers; Messrs. ISAAC HOUSE AND SON, for Scabious and Messrs. MAXWELL AND BEALE, for alpine.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Wednesday, July 20, 1927, at the Blackpool Flower Show, the members of Committee present were: Mr. J. B. Adamson (in the chair), Mr. A. Burns, Mr. D. A. Cowan, Mr. B. Collins, Mr. A. Keeling, Mr. J. Lupton, Mr. G. V. Llewelyn, Mr. J. McCartney, Mr. D. McLeod, Mr. W. J. Morgan, and Mr. H. Arthur (Secretary).

FIRST CLASS CERTIFICATES.

Laelio-Cattleya Profusion var. *The Queen*; *L.-C. Hassallii* alba var. *Leviathan*; *Brasso-Cattleya Muriel* var. *Adamsonae*; *Cattleya Harold* alba var. *Noel*; and *Odontioda Queen*

Sophro-Laelio-Cattleya Niobe.—From Messrs. STUART LOW AND Co.

CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Cattleya Harold* alba var. *Noel*, *Odontioda Queen Mary* var. *Oriflamme*, and *Odontoglossum eximium* var. *Beauté Celeste*; to Mr. J. BRACKEN, for *Vanda coerulea*; to Mr. J. LUPTON for *Odontoglossum amabile* var. *Fairlight*; to Mr. W. BYRON, for *Miltonia vexillaria* var. *Hy. Astley Bell*; and to Messrs. MANSELL AND HATCHER, LTD., for *Odontioda Iris* var. *purpurea*.

GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded. *Oncidium*s and *Cattleya* hybrids formed a special feature, the whole producing a very effective display. Messrs. A. J. KEELING AND SONS, Bradford, were also awarded a Gold Medal for a group of *Odontoglossum*s,

FIG. 58.—GOOSEBERRY LEVELLER.

(see p. 138).

Mary var. *Oriflamme*. From Mr. J. B. ADAMSON.

Laelio-Cattleya Tom G. Lamb (*C. Empress Frederick* × *L.-C. Baden-Powell*).—From Messrs. MANSELL AND HATCHER.

L.-C. Jacquinette var. *plumosa*.—From Messrs. STUART LOW AND Co.

AWARDS OF MERIT.

Cattleya Alaric (*Rubens* × *Dowiana*); *C. Falcon*, Towneley Grove var.; *Laelio-Cattleya Profusion* var. *Royal Monarch*; *Odontoglossum Craethus* var. *Purple Emperor*; *O. Lilian* var. *Perfection*; *O. Matador* var. *Sultan*; and *Odontioda Redstart* var. *nigrescens*.—All from Mr. J. B. ADAMSON.

Odontoglossum King Fuad and *Laelio-Cattleya compacta*.—From Messrs. A. J. KEELING AND SONS.

Odontoglossum Prapus var. *Gosie* and *O. Nola* var. *Suttoniae*.—From Messrs. SUTTON BROS.

Miltonia vexillaria var. *Hy. Astley Bell*.—From Ald. H. ASTLEY BELL.

Odontioda Iris var. *purpurea*.—From Messrs. MANSELL AND HATCHER, LTD.

Cattleyas and several plants of botanical interest; Messrs. MANSELL AND HATCHER, LTD., staged a very fine and varied exhibit to which a Gold Medal was awarded.

Col. Sir J. RUTHERFORD, Bart., Blackburn (gr. Mr. J. Lupton), exhibited a group to which a Large Silver-Gilt Medal was awarded; this contained *Odontiodas* in variety, with hybrid *Cattleyas*. J. MCCARTNEY, Esq., Bolton (gr. Mr. C. F. Potts), was also awarded a Large Silver-Gilt Medal for an effective group; and Messrs. SUTTON BROS. had a group for which a Silver-Gilt Medal was awarded.

Ald. HY. ASTLEY BELL, Garstang (gr. Mr. H. Byron) was awarded a Silver Medal for a small group composed of *Miltonias* of the *vexillaria* section and nice plants of *Cypripedium Maudiae*; Messrs. STUART LOW AND Co., Enfield, contributed a mixed group for which a Silver Medal was also awarded.

The next meeting will be held at Southport on Wednesday, August 24, 1927, and it is hoped that members will do all they can to support this effort, and excel, if possible, the fine display at Southport last year, as it is the desire of the Southport Show Committee to make the Orchid section a special feature.

ANSWERS TO CORRESPONDENTS.

FUNGUS GROWTH ON TENNIS LAWN.—H. B. C. The information concerning what you term an unpleasant fungous growth is not very full. About the only clues you give as to the nature of the organism is that it is dark, transparent green, slippery when trodden upon, very bad after much rain, especially in places where the grass has been worn bare. If this organism lies like a film on the soil, it is almost certain to be a species of *Vaucheria*, or *Oscillatoria*. The transparent green and all the other characters apply to the *Vaucherias*, which are very common in water, on damp earth and on wet ashes. All these organisms are Algae with chlorophyll or leaf-green in them. There are toadstools of various colours, but we presume you would have named them such. As the *Vaucherias* lie on the surface, it would require less expenditure to kill them, than in the case of toadstools that grow up out of the soil. They could be killed by dusting them with lawn sand, sulphate of ammonia, nitrate of soda, common or table salt, or watering them with a rose-red solution of permanganate of potash. Select a perfectly dry day for the operation to avoid dilution of either remedy. In dry weather the organism will dry up and disappear, as it requires moisture to grow.

LEAVES FROM GREENGAGE TREE.—A. S. The leaves sent had become very dry in the post, and it is impossible to say with certainty whether they are attacked by the Silver-leaf fungus or not. The silver colouration is due to separation of the cells of the leaf and the presence of air spaces, the fungus causing the disease being found in the wood, often well below the position of the silvered foliage. The three leaves sent do not appear to be silvered, but we would advise you to apply to the Advisory Mycologist of your district, at Long Ashton Research Station, near Bristol, who might be able to inspect the tree in question.

JASMINUM OFFICINALE FAILING.—Anxious. There was nothing present on your specimen of *Jasminum officinale* to indicate the cause of death. It would appear that the branch died naturally, as sometimes happens with this and other climbers.

LUPINS DISEASED.—W. H. W. The swellings on the stems and roots are galls probably produced by bacteria. They would account for any poor growth of the affected plants, but we cannot explain why the blue and pink varieties are not affected, while the white ones appear to suffer. We suggest that you try an entirely new site for the Lupins next year.

MELON LEAVES FLAGGING.—H. T. The condition of your Melon leaves leads us to suggest that the real trouble in regard to your plants will be found in the roots, and, before we can give a definite opinion, it would be necessary for you to send us some roots for examination.

NAMES OF PLANTS.—R. S. 1, *Rhododendron Wilsonii*; 2, *Olearia stellulata*; 3, *Spiraea bullata*; 4, *Viola tricolor*; 5, *Lithospermum graminifolium*; 6, *Veronica cupressoides*.

STRAWBERRIES AND VIOLAS DISEASED.—A. M. S. The Strawberries appear to be suffering from leaf-spot disease as well as from the deterioration which is affecting Strawberries in many places. Your best plan would be to burn the plants and start on a new site with a clean, healthy stock. The Violas are suffering from *Viola rust* which may be kept in check in its earliest stages by spraying with potassium sulphide, but when plants are so seriously affected as yours, they should be dug up and burnt, and plants should not be propagated from them.

REMARKS.—Business is sluggish in the cut flower department, and as flowers of many kinds are abundant, prices are low. *Roses*, *Carnations*, and *Gladioli* are arriving in excess of ordinary requirements, consequently the street traders buy up large quantities at the close of the market, and were it not for their assistance, many flowers would be consigned to the dust carts.

REMARKS.—The glut of fruit, mainly Plums and Gages, from the continent, last week brought about rather erratic conditions in certain sections. At the week-end, home-grown Plums fell sharply in value, but at the time of writing the position shows much improvement. Choice fruits, such as *Grapes*, *Peaches*, *Nectarines*, *Figs* and *Melons*, are quoted rather easier. Dessert Apples, however, are a firm trade, as also are large cookers, but small and medium fruit is selling badly. A few late *Cherries* are selling remarkably well, as usual, and will continue to meet a good demand while they arrive in a satisfactory condition. *Mushrooms* sell fairly well, but the quantity available is not large. Good *Peas* are wanted, but French Beans sell slowly at low prices. The *Tomato* trade is very good just now and prices have improved. *Cucumbers* are selling only moderately well. The vegetable section is not particularly busy, and trade is only fair. The *Potato* business is also on the quiet side and quotations are moderate.

GLASGOW.

Little change has to be reported in the conditions under which business was conducted in the cut flower market during the past week. For the most part prices were steady and any changes that took place were in a downward direction. *Carnations* continued plentiful and cheap, being worth from 1/- to 1/6 per dozen; *Roses* ranged from 9d. to 2/-; *Gladioli*, 9d. to 1/3 (6's); *Sweet Peas*, 1d. to 4d. per bunch; *Chrysanthemums*, 4d. to 8d.; *Stocks*, 4d. to 6d.; *Asters*, 2d. to 6d.; *Marguerites*, 1d. to 3d.; *Morning Star*, 1d. to 2d.; *Gypsophila*, 2d. to 3d.; *Lilium longiflorum*, 2/3 to 2/6; and *Asparagus*, 9d. to 1/3.

Soft fruits dominate the fruit market. Special table Strawberries realised 1/6 per lb.; ordinary qualities, 8d. to 1/-, and jam berries, 6d. to 7d.; *Black Currants*, 10d. to 1/2; *Red*, 4½d. to 6d.; *White*, 3½d. to 4d.; *Raspberries*, 8d. to 10d.; green *Gooseberries*, 2d. to 2½d.; *yellow*, 5d. to 6d.; *Czar Plums*, 10/- to 12/- per sieve; *French Plums*, 7/-; *Cherry Plums*, 8/- to 9/-; *Grapes*, 1/9 to 2/- per lb.; *Muscats*, 3/- to 4/-; *Peaches*, 6/- to 8/- per dozen; imported, 5/- box; *Williams's Pears* (64's), 14/-; (72's), 12/-; *Cantaloupe Melons*, 7/6 to 8/- per case of 8; *English Apples*, 4½d. per lb.; *Grape Fruit*, 22/- to 27/- per case; *South African Oranges*, 25/- to 28/-; *Californian*, 30/- to 34/-.

In the vegetable section, *Tomatoes* ranged from 6d. to 8d. per lb.; *Marrows*, 4/- to 6/- per pot; *French Beans*, 4d. to 5d. per lb.; *Lettuce*, 1/- per dozen; *Cauliflowers*, 5/- to 7/-; *Cucumbers*, 5/- to 8/-; and *Peas*, 5/- per sieve.

GARDENING APPOINTMENT.

Mr. W. H. Wain, previously gardener for nine years to the late E. J. WOOLLEY, Esq., West Thorpe, Bowdon, Cheshire, as gardener to F. G. MAGUIRE, Esq., Glenbank, Bangor, Co. Down, N. Ireland. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 60.7°.

ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, August 17, 10 a.m. Bar. 30.0. Temp. 60°. Weather, Sunny.

Oil Sprays
for Spring and
Summer Use.

THE number of spray-materials multiplies almost as fast as the pests which they are destined to control, but there is always room for more, provided that they are cheaper and more efficient than those which they are destined to replace. Oil sprays, though as yet not much used in this country, have been employed widely in Canada and in the United States, and hence it was well worth while that they should be tried here, and particularly that they should be tried as substitutes for nicotine. The report* now issued by the Agricultural and Horticultural Research Station of Long Ashton indicates that of the oil sprays tested, Rape oil is both cheap and effective. It is readily emulsified by several mixings with liquid soap, that is, soft soap consisting of one part soap and two of water. An eight per cent. soap solution made by diluting liquid soap until one-twelfth of it is soap is used for emulsification. The soap and oil in equal quantities are poured one into the other several times till complete emulsification is effected. To the water in the spraying tank enough soap is added to give it a lather, and then enough of the emulsion prepared as indicated above is poured into the tank to give the strength required.

* Annual Report, 1926.

Rape oil emulsion may be used up to a strength of two per cent. Used as a spray for Roses half per cent. is strong enough and is found not to scorch the petals. The uses of Rape oil emulsion as a spray would appear to be numerous. The emulsion may replace tar-distillate washes when, owing to the presence of under crops and because of weather conditions or labour shortage, the latter excellent insecticide cannot be used. It may serve as a cheap aphid wash for spring and summer use, and it may also be used as a cheap content wash to control Apple capsid bug, woolly aphid and similar pests, in which cases it should be employed at a strength of from one to two per cent. The investigations which are being conducted by Mr. L. N. Staniland are being continued and the results should prove of interest and value. In the meantime those who would like to experiment with Rape oil emulsion may apparently do so with confidence that they will be employing an insecticide which can do little if any harm to foliage, and quite considerable execution on the pests which attack top and bush fruits as well as Roses and other garden plants. Whether with fuller experience this new type of spray will be found to be more effective than the excellent materials already available, time and experience alone can tell.

Colonial Appointments from Kew.—At the present time, when so many careers appear overcrowded, it is interesting to emphasise the remarkably good opportunities which await the young student of horticulture who is keen to see something of the world and does not mind living a life, not unconnected with real adventure, in the tropical colonies of the Empire. These opportunities, of course, are not unlimited, but many of the student gardeners at the Royal Botanic Gardens, Kew, who desire a life overseas and who are physically fitted for it may secure appointments in the service of a Colonial Government. These posts are generally in the horticultural section of a Colonial Agricultural Department, though often appointments are made to the general executive side of the department. The initial salaries vary from £300 to £480 per annum, and the prospects, which entirely depend on the individual, are exceptionally good. During the past year or two student gardeners have been appointed to posts in the West Indies, Gambia, Sierra Leone, Gold Coast, Sudan, Zanzibar and Straits Settlements, whilst quite recently others have gone to the Federated Malay States and the Cameroons. One was selected last year for a two-year scholarship at the South-Eastern Agricultural College, Wye, and the Imperial College of Tropical Agriculture, Trinidad, under the Milner Scheme of training candidates for the Colonial Services. That these men make good can be seen from the appearance in the recent Birthday and New Year's Honours Lists of the names of several old Kew men in Colonial Services, whilst more than one Colonial Agricultural or Horticultural Department has a Kew man at its head. It would require a long article to enumerate the many public and private appointments held by Kew-trained men in this country, in the Empire, overseas and in foreign countries the world over, but it is not often realised what excellent opportunities occur in the tropical Colonies. It may be mentioned that candidates are required to have four years' good practical training in horticulture before entering Kew, and that during the two years they remain at Kew they undergo an extensive course of lectures and training in sciences pertaining to horticulture, in addition to their practical training.

The Cider Apple Crop.—According to the *Agricultural Market Report* issued by the Ministry of Agriculture, the prospects of the cider Apple crop in this country are variable. The best reports come from Somerset, where the crop is expected to be heavy in one or two

districts and well up to the average generally. A fair amount of dropping is reported from Devon, and the crop promises to be slightly below the average. In Gloucester, Dorset and Hereford the crop is likely to be moderate only, and in Worcester light to moderate. The cider Apple crop in France is likely to be good.

Garden Competition in Hamburg.—The Corporation of Hamburg (with Altona and Wandsbek) is arranging again this year, as last, a competition for the best front garden, balcony, etc., with a view to encouraging the inhabitants to take a pride in the horticultural decoration and development of their dwellings. The rewards to be given include diplomas, medals, Palms, and pot plants, the whole expense of which is being borne by the municipality.

Origin of Some Fruit and Vegetable Names.—*The Fruit, Flower and Vegetable Trades' Journal* for August 13 gives the origin of the names of some of our common fruits and vegetables. The Gooseberry is said to have no connection with Geese, but derives its name from the old High German word, *Krus*, meaning crisp. Shaddocks are named after a seventeenth century seaman, a Captain Shaddock, while Gages recall the memory of Sir W. Gage, of Hensham Hall, who introduced the fruit from Chartreuse, France. The Filbert takes its name from St. Philibert, whose day falls at the beginning of the nutting season. Marmalade comes from a Portuguese word, marmalado, the golden, Pear-shaped Quince from which the preserve was originally made. Cole, the original name of the Cabbage, gives us Cauliflower and Kale. Many vegetables are named after places, such as the Savoy, Brussels Sprouts and Rhubarb, which is found on the banks of the Rha, the Russian name for the Volga. Parsnip is from the Italian *pastinum*, a pointed instrument used for making holes in the ground. With regard to the origin of the Loganberry, it is news to learn that it is named after the Canadian mountain where it was first cultivated. We always understood this fruit was named after Judge J. H. Logan, of Santa Cruz, California, as stated in Bailey's *Standard Cyclopedia of Horticulture*.

A New Hudson Memorial.—Adjoining the Brent Valley Golf Links, in the Borough of Ealing, is an estate of seven acres, and the greater part of the grounds having been left almost entirely untouched for fifteen years or more, it has become a recognised haunt of birds, many species being known to have nested there. These include the Blackcap, the Garden and Willow Warblers, the Whitethroat and the Moorhen. Wildfowl come to the lake which is formed by the perennial spring, and the Goldfinch and Green Woodpecker are often to be seen. The Selborne Society has long wished to protect the ground in question, and at last there is an opportunity of acquiring it. It has been suggested that it would make a fitting memorial to the late W. H. Hudson, who helped the Selborne Society to establish the Brent Bird Sanctuary at Perivale, higher up the river, which twenty-five years ago set an example that has been widely followed, of preserving for urban districts the interesting birds of the countryside. It will not be necessary for the Selborne Society to take over the mansion, as this has been fitted up as a hospital by the Government, but if funds allow, two good things might be done at once, for it could most appropriately be placed at the disposal of some charitable organisation, or it could be used as the beginning of a Folk Museum, which ought to be inaugurated in this country before it is too late. The property was advertised for sale by auction in building plots, but some members of the Selborne Society have, for the moment, saved it from this fate, and Lord Montagu of Beaulieu, Lord Avery and Sir John Otter are making an appeal for donations towards its purchase and maintenance. Donations should be sent to the Treasurer, Sir John Otter, at The Hermitage, Hanwell, W. 7.

A Dutch Horticultural Jubilee.—The beautiful and ancient town of Leiden, in Holland, is busy with preparations for the festivities planned

for September 13 and the five following days, to mark the fiftieth anniversary of the formation of the local branch of the Dutch Royal Horticultural Society. In a country like Holland, where commercial horticulture takes such an important place among industries, an event such as the one now about to be celebrated arouses much public interest. The Burgomaster is to open the initial proceedings in the historic Town Hall; on September 14 there is to be a representation of a floral play, or opera; excursions are to be arranged to Wassenaar and Noordwijk and altogether, given a reasonable amount of sunny, open weather, the festival week should be an immense success. Quite apart from its horticultural interest, Leiden has a wealth of historic associations to offer to anyone archaeologically inclined, as well as a beauty and picturesqueness which delights every artist-visitor.

Fifth International Botanical Congress, Cambridge, 1930.—At the International Congress of Plant Sciences (Fourth International Botanical Congress) held at Ithaca, United States, in August, 1926, an invitation was conveyed from British botanists for the Fifth International Botanical Congress to be held in England in 1930. The invitation was accepted by the botanists assembled at Ithaca, and arrangements are now being made for the Congress to be held at Cambridge about the middle of August, 1930. An executive committee has been formed to make arrangements for the Congress, consisting of Dr. F. F. Blackman, Professor V. H. Blackman, Dr. E. J. Butler, Professor Sir John Farmer, Professor F. E. Fritsch, Professor Dame Helen Gwynne-Vaughan, Dr. A. W. Hill, Professor W. Neilson Jones, Sir David Prain, Dr. A. B. Rendle (Treasurer), Professor A. C. Seward (Chairman), Professor W. Stiles and Professor A. G. Tansley. It has been decided to organise the Congress in the following seven sections: Morphology (including Anatomy), Palaeobotany, Plant Geography and Ecology, Taxonomy and Nomenclature, Genetics and Cytology, Physiology, and Mycology and Plant Pathology. Mr. F. T. Brooks, The Botany School, University of Cambridge, and Dr. T. F. Chipp, Royal Botanic Gardens, Kew, have been appointed Honorary Secretaries of the Congress, and any communications with regard to the Congress should be addressed to one or other of the Secretaries.

Potash from the Dead Sea.—The *Times* of Monday last gave interesting particulars of the chemical constituents of the Dead Sea, which is estimated to contain 2,000 million metric tons of potassium chloride; 980 million metric tons of magnesium bromide; 11,900 million metric tons of sodium chloride (common salt); 22,000 million metric tons of magnesium chloride; and 6,000 million metric tons of calcium chloride. The supply of potash is said to be practically inexhaustible, and it is this product that makes the Dead Sea valuable from a commercial point of view. The rights to exploit the vast chemical resources of this inland sea were put up to public tender by the Crown Agents for the Colonies, and although the original tenders were found unsatisfactory and rejected, negotiations with certain British principals have reached an advanced stage and apparently only questions of detail have to be settled. The *Times* gives particulars of the method by which it is proposed to extract the salts. There will be three principal stages; first, the common salt will be crystallised out, and the mother liquors drained off into carnallite crystallising tanks. Next, the carnallite will be crystallised and the mother liquor drained off and allowed to flow back into the Dead Sea, unless it is used later for the production of magnesium, calcium chloride and bromide. Fresh water will be run on to the carnallite through sluices, which will decompose and readily dissolve the fine crystalline mass of carnallite in those parts of the pan where there is motion of the fluid. In the third stage evaporation will go on with about the same rapidity as in the original brine pan until the potassium chloride is crystallised. It is estimated that for every ton of eighty per cent.

potash, five tons of common salt will be produced and 40,000 tons of bromide returned to the Dead Sea. If the production of potash is successful commercially, the bromide will probably be extracted, which, at its present price, will be a lucrative business. A vast amount of pure magnesium chloride will be produced in the process, for which there will be a market and there is a fair market for calcium chloride; one of the uses to which the latter could be put would be in liquid form for preventing dust on roads during the dry season in the Near East.

The Rt. Hon. The Lord Lambourne, P.C., C.V.O., V.M.H.—We offer our heartiest congratulations and those of our readers to the veteran President of the Royal Horticultural Society on attaining his eightieth birthday, which happy event he celebrated on Wednesday last. He was present at the R.H.S. meeting on the 16th inst., as full of life and jollity as ever, receiving the heartiest congratulations of numerous horticultural friends. A letter written by Lord Lambourne to the press recently

THE RT. HON. THE LORD LAMBOURNE,
P.C., C.V.O., V.M.H.

on the modes and manners of his times has caused much amusement and interest. It has been severely criticised by a prominent literary man, who had taken him too seriously. In reply to his critic Lord Lambourne said "I have been frivolous all the days of my life, and shall probably be frivolous when I am 90, 100, or 110, to all of which ages I intend to reach." An example of the delightful wit of Lord Lambourne was his statement to an interviewer he believed with his critic that the English aristocracy was distinguished forty years ago by "a number of extremely brilliant and delightful people who lived lives of singular graciousness and great social service," remarking "Hear, hear! I must have been one of the others." The Royal Horticultural Society is indeed fortunate in having as its President a nobleman so distinguished in the social and political world, an ideal Chairman, who combines facetious remarks with a keen sense of the business importance of a chairman's duties, and a keen lover of gardening. That he may live long to continue in the office he so worthily fills is the heartiest wish of all connected with the Society and horticulture generally.

Mr. Hemsley's Sidalceas.—At the Staffordshire and Midland Counties Floral Fête, held at Burton-on-Trent, on the 10th and 11th inst., Mr. H. Hemsley, Crawley, won the seventy guinea Challenge Cup offered by Messrs. Abol, Ltd., "for the most progress made in plant breeding during recent years," with his strain of Sidalceas. His exhibit filled a space forty

feet by ten feet, all of Sidalceas of his own raising, including such varieties as Miss Willmott, dark crimson; Marcus Adams, carmine; Miss Walters Anson, double, rosy-pink; Hemsley's White, clear pure white; Mrs. R. Corfield, rich crimson; John Sherratt, petals overlaid with satiny pink; Mrs. L. R. Messel, flesh pink; and Mrs. J. B. Riding, double, soft pink. Other flowers entered for the competition were Scabious, shown by Messrs. I. House and Son, and Rose Princess Elizabeth, exhibited by Messrs. Wheatcroft Bros.

Legacies to Gardeners.—Mr. F. Copeman, of Shenfield, Essex, who died on May 8, leaving a fortune of £174,296, bequeathed £50 to his head gardener.—Mr. Philip L. Townsend, Lawnfield, Maidenhead, who died on March 21, leaving an estate valued at £54,476, bequeathed an annuity of £10 to his late gardener, Mr. Thompson.

German Horticultural Exhibitions.—On July 16 and 17, an exhibition of cut Roses took place in the hall of the Frankfurt Palm Garden, which aroused widespread interest and attracted crowds of visitors. There were about 5,000 Roses on show, from Frankfurt and the district, all the chief growers having vied with each other in furnishing exhibits worthy of their reputation. At the close of the exhibition the Roses were sent to the hospitals, where the patients welcomed them warmly.—From July 9 to 11, a Rose show was arranged by the Hesse Confederation of the German Gardening Society, at Steinfurth, a great German Rose-growing centre. So popular was the exhibition that on the Sunday afternoon it was necessary for a time to close the doors and prevent anyone else from entering, as the fine weather brought many visitors from neighbouring towns, partly to see the show, and partly to view the fields of Roses which are a feature of the Steinfurth landscape.—At Zwenkau, from July 16 to 18, a Rose show was organised to celebrate the completion of the twenty-five years' existence of the local Gardeners' Association. The show was very interesting, and many excellent exhibits were contributed, besides a large number of florists' and horticultural sundries—perhaps a trifle too many, considering the small scale of the show. However, it was a great success, and reflected credit on its organisers.

"Botanical Magazine."—The August issue of this valuable work contains descriptions and illustrations of some very beautiful garden plants. Tab. 9,116 is a double-paged plate of Magnolia Sprengeri diva, one of the most beautiful of all the Magnolias introduced in recent years. In the accompanying description by Dr. Stapf it is described as the Chinese representative of the Himalayan M. Campbellii, which it rivals in beauty, or as a superior sister-species of the Yulan, M. denudata. It is distinguished from the latter in the number of petals, twelve, and in the shape of the leaves, which are slightly glaucous on their underside, and from the former by the shape of the leaves and their much scantier indumentum in the young state. The material from which the plate was prepared was obtained from a tree growing at Caerhays Castle, Cornwall. Cypripedium manchuricum virescens, t. 9,117, is synonymous with C. ventricosum and C. macranthon. The solitary flowers have a large, globose-obovoid lip, and this organ, together with the other parts of the flower, are whitish with a greenish suffusion. The plant has proved to be hardy in Switzerland, and it is probably hardy in this country. Anagallis collina, t. 9,118, has a habit somewhat like that of our native Pimpernel, but the flowers are brownish or terra cotta, according to the plate, although described in the text as brilliantly scarlet with a purple centre. Rhazya orientalis, t. 9,119, was illustrated in *Gard. Chron.*, July 11, 1925, page 31. Vol. LXXVIII (not LVIII, as stated in the *Bot. Mag.*). Rhododendron megeratum, t. 9,120, is a dwarf shrub with bright yellow flowers, and described by the late Sir Isaac Bayley Balfour as one of the most charming of the dwarf Rhododendrons, the specific name he gave it meaning "lovely in the highest degree." Primula effusa, t. 9,121, is a species of the malacoides type, with

flowers in whorls developed on long peduncles, the individual pips being a little larger than those of *P. malacoides* and of a lavender-rose colour. *Salix gracilistya*, t. 9,122, is a distinct species with very long, slender styles, which are responsible for the specific name. The leaves are broadly lanceolate and greyish-glaucous on the undersurface. The fine, silky catkins with anthers of a brilliant orange or scarlet colour, are particularly attractive. *Aster Forrestii*, t. 9,123, is a dwarf species of great garden promise. The flowers are purplish-violet with a rich orange disc. The species was found by Forrest on the snow mountains north of the Doker La in 1918. *Acacia marginata*, t. 9,194, was found by Robert Brown so long ago as 1801, in King George's Sound, and was introduced into cultivation in 1803. It is near to *A. myrtifolia*. *Spartina Townsendii*, t. 9,125, was described in *Gard. Chron.*, Vol. XLIII, page 33. It is one of the mud-binding grasses, and found on the coasts of Essex, Hampshire and the Isle of Wight. *Habranthus robustus*, t. 9,126, is the *Zephyranthes robusta* of Baker. It is a very beautiful plant and native of the Parana and Uruguay Rivers. The species was introduced in 1827 by Mr. J. B. Mackay, a nurseryman of Clapton, from Buenos Aires. It makes a fine pot plant and is suitable for cultivating out-of-doors on a warm border near to a wall.

August Exhibition in Berlin.—The German Horticultural Society is organising an indoor flower and plant exhibition to take place from August 20 to 28, with sections for Cacti, summer-blooming flowers, Roses, perennials, Dahlias and Gladioli.

International Conference of Allotment Holders.—The first international Conference of Allotment and Gardens Federations is being held at Luxembourg on August 19 to August 22, when about twenty different nationalities will be represented. The Conference is being held under the patronage of the Grand Duchess of Luxembourg and the Government of the Grand Duchy. Delegates from the National Union of Allotment Holders of England and Wales are attending the Conference.

Golden Wedding.—Mr. and Mrs. J. May, late of Northaw House Gardens, Potters Bar, celebrated their golden wedding on August 18, at Childwick Bury Gardens, St. Albans. Mr. May was for many years at Northaw House and was formerly a very successful exhibitor of vegetables in the London district.

Whiteley's Flower Competition.—We are glad to find that the use of flowers for advertising purposes is growing steadily, if slowly. Messrs. Wm. Whiteley, Ltd., have organised an attraction in the form of a flower competition. All that is required is a bunch of flowers from competitors' own gardens, mixed or otherwise; four prizes of £5 each, and four of £2 each are offered. There will be two competitions, the first on Tuesday, August 23, and open for exhibition on Tuesday and Wednesday. Entries should be taken to the Stores if possible on Monday, August 22, although entries received by post before 9.30 a.m. on Tuesday morning will be in time to be judged. There will be two classes, *i.e.*, Class A: grown within twelve miles of Whiteley's; and Class B: grown outside this twelve mile radius. The second competition, on similar lines, will take place on Thursday, August 25, and the flowers will remain on view during Thursday and Friday, August 25 and 26.

Darmstadt Exhibition.—The Chamber of Agriculture in Hessen has in hand the arrangements for a great agricultural exhibition to take place in Darmstadt during six days in September, from the 15th to the 20th inclusive. This will include a vast Fruit, Vegetable and Flower show, to which visitors from all parts of Hessen are expected to come. The programme is framed on the best modern lines, and sorting and packing are given due prominence in the fruit classes, which are likely, in view of the extent of the local fruit-growing industry, to be the central

point of interest. A large, newly-built hall is to accommodate the exhibition, which will include a section of the newest agricultural machinery and implements.

Florists' Telegraph Delivery Association.—This Association will be represented at Southport Flower Show on August 24, 25 and 26, by examples of floral art, by members who will address the public, and by literature explaining the aims and objects of the Association. A Conference will be held in Cambridge Hall, Lord Street, Southport, on Thursday, August 25, at 3 p.m.; afternoon tea will be provided for all who attend. The object of the Conference is to discuss

Horticultural Society's show; Helensburgh and Gareloch Flower Show; Lanark Flower Show; Dunbar Flower Show. THURSDAY, AUGUST 25: Dundee Horticultural Society's Show (three days); Lochgilphead Flower Show; Ayton Flower Show; Paisley Florists' Society's meeting. FRIDAY, AUGUST 26.—Holytown Flower Show; Inverness Flower Show; Dunfermline Flower Show (two days). SATURDAY, AUGUST 27: Innerleithen and Traquair Flower Show; Alexandria Flower Show; Auchterarder Flower Show; Baillieston and District Flower Show; Beith Flower Show; Chirnside Flower Show; Dailly Flower Show; Selkirk Flower Show; Falkirk Flower Show.

FIG. 59.—STAPHYLEA HOLOCARPA.
(see p. 148).

ways and means for a collective advertising campaign; the discussion will be opened by Mr. E. Horton (Messrs. Bees, Ltd.), followed by Mr. J. Dobson, Glasgow.

Marburgh University Anniversary.—The University of Marburgh, Germany, is celebrating this year its four hundredth anniversary, and in order to take its due part in the festival arrangements, the Botanic Garden is provided with a carpet bed on which is shown the Hessen Lion rampant and the dates 1527-1927. This design, which is carried out in Begonias, Iresines, Sempervivums, and Alternantheras is exciting great interest among the Marburgh townsfolk.

Appointments for the Ensuing Week.—WEDNESDAY, AUGUST 24: Southport Flower Show (three days); Littlehampton and District

"Gardeners' Chronicle" Seventy-five Years Ago.—*Beach's Queen Strawberry Plants.*—Having taken several prizes these two years with Queen's Strawberries, thousands of them weighing upwards of two ounces, many of them I exhibited last year in the Crystal Palace upwards of three ounces, and this year, at Chiswick, they gained two Knightian Medals on July 10; and also on the 14th inst. the Head Prize at the Great Show at Lewes. See also Dr. Lindley's opinion of them in *The Gardeners' Chronicle* of the 10th of July, and likewise Mr. Cuthill's account of my place in the same Journal of the 24th of July. Strong, healthy, and fine plants are now ready to be sent out at 5/- per 100, box included.—Post Office Orders on Hounslow to Mr. Thomas Beach, Market Gardener, Worton, Isleworth, near London. *Advertisement in Gard. Chron.*, August 21, 1852.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEMON,
Bletchley Park, Bletchley, Bucks.

Succulent-leaved Cypripediums.—The thick-leaved Cypripediums which comprise *C. concolor*, *C. bellatulum*, *C. Godefroyae*, *C. niveum*, *C. leucochilum* and numerous hybrids, are among the gems of an extensive genus, but they are not so easily managed as the majority of Cypripediums. Many fail to grow this season successfully or retain the plants in a healthy condition over a series of years. Many of the hybrids, of which *C. Boltonii* is an example, are of free and vigorous growth; therefore there is no reason why some members of these delightful plants should not be enjoyed. The plants succeed best when grown close to the roof-glass, where they are free from drip, and out of the way of the syringe, and a warm, moist atmosphere is necessary to their well-being. In their native habitat the species are found growing in abundant sunshine which their thick, leathery leaves are capable of withstanding, and they undoubtedly retain this liking for a light position under cultivation. Shading is necessary because exposure under glass to direct sunshine would burn the foliage, but at the same time the plants should not be overshadowed at any time. During the growing season the plants need liberal supplies of water at the roots, but during the winter the greatest care is necessary, although even at that season they must not be allowed to become dry. Watering overhead is not to be recommended and, in most cases, is decidedly harmful. The most suitable time for repotting these Orchids is soon after they have passed out of flower, but disturbance at the roots should not take place unless the conditions of the compost and drainage demand it. The plants usually succeed best in a compost consisting of turfy loam, peat fibre and Sphagnum-moss, and they display a preference for limestone, so that if the loam obtained is from limestone, so much the better. Limestone may also be used in lieu of crocks for drainage, and crushed limestone may be mixed in the compost to keep it open in texture.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Celery.—If the weather is dry during this month, the roots of Celery should be well soaked, both with clear water, and liquid manure. Keep the foliage well dusted with old soot, or it will be attacked by Celery fly. When the early plants are sufficiently advanced, it will be necessary to commence earthing up, adding a little more soil every fortnight; before doing this, mix a little lime or soot with the soil.

Beet.—Owing to the wet weather, the early crop of Beets has grown very fast, therefore, the roots should be lifted before they become too large and coarse. Store them in the coolest place possible, in sand. The utmost care should be taken when lifting not to break or damage any of the roots, or loss of colour will result. The leaves should not be cut off with a knife, as is often done, but be twisted and wrenched off; hold about two inches of the leaf stems nearest the root firmly in one hand while with the other hand wrench off the leaves. Do not allow the roots to lie long on the ground as they quickly wither.

Thinning Crops.—Many crops sown during July are now ready for thinning, and this work should be done without delay, the crop afterwards being given a light dusting of soot and kept well hoed.

Corn Salad.—It will be wise to sow a batch of this useful salad for a late autumn supply. Sow the seeds in drills drawn one foot apart,

and thin the plants to about four inches apart so soon as they are ready. If the weather is dry keep the plants well watered.

Marrows.—These are fruiting well and should not be allowed to suffer from lack of water at any time. Clean water should be alternated with liquid manure, as Marrows are gross feeders. Keep the growths well thinned and trained in position with strong pegs. Do not allow the fruits to become old and coarse. Should disease appear cut out the affected shoots at once, or it will quickly spread over the whole plant.

Shallots.—Lift these so soon as they are ripe, and lay the bulbs out thinly in a very sunny position to dry.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NAIL-CAIN,
Brockett Hall, Hertfordshire.

Calceolarias.—Prick off the seedling Calceolarias so soon as they can be handled; the compost at this early stage should consist of equal quantities of sifted loam and leaf-mould, adding plenty of silver sand to keep the compost open. Young plants that have been pricked off previously into boxes should be transferred to small pots when it is considered necessary to do so. Make the soil fairly firm with the fingers, but do not bruise the tiny plants in the process of potting. Afterwards place them in a cold frame or pit where they may enjoy plenty of light without being directly exposed to sunshine. Keep the frames closed for a short time after potting, but when it is noticed that the Calceolarias have re-established themselves, afford them plenty of ventilation. Slugs are very partial to these plants, and means should be employed to keep these pests in check.

Souvenir de la Malmaison Carnations.—Where these were propagated early by layering they will soon be ready for lifting and potting, but several days before proceeding with this operation the layers should be severed and the surroundings thoroughly watered so that they may be lifted with all the roots attached. Those that have rooted freely may be placed in forty-eight-sized pots, while those that have fewer roots may be potted into sixties. The potting compost should consist of good loam with plenty of old mortar rubble added, and it should be moderately dry to allow it to be rammed fairly firmly. Afterwards stand the plants in a cold frame which should be kept close for a few days and shaded from bright sunshine.

Pelargoniums.—Varieties of the show and regal Pelargoniums that have been stood outside should now be cut hard back and laid on their sides for a week or so to ensure a complete rest. It is always advisable to propagate a few cuttings each year to keep up a vigorous stock, and the best shoots should be selected for this purpose. These will root very quickly if stood in a cold frame and sheltered from heavy rains. The required number of old plants should be repotted into smaller receptacles so soon as they show signs of breaking into new growth. During the winter months they should be grown as cool as possible and be placed in a light position close to the roof glass and allowed plenty of fresh air.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Sweet Cherries.—Most of the trees growing against west walls have borne very satisfactory crops in these gardens. The varieties which generally give the best crops are Early Rivers, a very sweet, early black sort that yields well both on west and east aspects; Waterloo, Elton Heart, Bigarreau de Schrecken and Napoleon Bigarreau; the last-named has been very fine, but because there was little sunshine during the ripening period the individual fruits lacked sweetness. Where the fruits have been gathered, remove the nets and store them in a dry, airy place. All the leaders and shoots needed must

be neatly secured in position, while others not required for any particular purpose should be shortened back. Afterwards wash the foliage thoroughly to dislodge any insect pests. If the soil surface has become hard and baked it should be loosened to a depth of two or three inches to allow water to pass freely down to the roots. A liberal dressing of lime, a top-dressing of good loam and lime rubble, or a mulch of manure, followed by a thorough soaking of water will, in most cases, prove very helpful to the trees.

Heavy Fruit Trees.—In many gardens fruit trees are carrying heavy crops of fruits, and in such cases the branches should be supported to prevent breakage. See that all heavily cropped trees are well supplied with liquid manure, or mulched with good manure, and then thoroughly deluge the soil with water; this is very important, both for improving the size of the fruits and for helping the trees to build up strength for next season's crop. Bush trees and others should not be overlooked in this respect.

Wall Trees.—Examine the roots of all wall trees bearing good crops of fruit, and if they are dry, supply them with an abundance of water or liquid manure at once, so that they may benefit before it is too late for them to do so this season. Notwithstanding the heavy rains which may fall, the roots of wall trees are very liable to become dry.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Early Peaches.—Where the lifting or root-pruning of trees in early houses is contemplated, active preparations should be made for carrying out the work. Where exhausted trees have to be replaced by those from open walls, the operation must stand over for the present, but few would trust such trees to give Peaches in May, when a transfer from a successional house is so easily managed, and this latter tree can be replaced from the open walls. Light root-pruning, or root-lifting, is now reduced to a fine art; the work is quickly performed and the small quantity of fresh soil required may generally be found by those who know and appreciate its value. Stiff, calcareous loam from an old pasture or roadside contains nearly all the essentials for the production of healthy wood and the finest fruits. If too heavy it may be corrected by the addition of burnt clay and lime rubble, lime being absolutely necessary to the formation of the stone in the fruits. If too light, dry, pounded marl will give "body" to the material which may be fortified by the addition of bone meal or a small amount of decomposed manure, but the last should be used only in extreme cases of poverty, as it is better to give the necessary food by mulching and feeding when the fruits are developing. Good drainage—the first and most important item in the formation of all fruit tree borders—should be secured, allowing a depth of twenty-four inches for heavy soils and up to thirty inches for light soils; there is no need to dig deeper as it is better to keep the roots near the surface than allow them to descend, as they will when mulching, and feeding are neglected.

Successional Houses.—Trees cleared of fruits in July or early August will have ample time for ripening their wood, but they must receive plenty of air night and day, be kept thoroughly moist at the roots by copious waterings, and treated to liberal syringings on fine evenings. Persevere in the removal of all breast wood from trees ripening their crops of fruit and pinch out the points of shoots which will be cut away later. Gather the fruits early in the day when dry and cool and—for home use—twenty-four hours before they are needed, as once they become dead ripe on the tree, they are generally past their best for dessert purposes.

Late Houses.—Trees that are carrying heavy crops of fruit in late houses will be exceptionally useful this season owing to the scarcity of Pears and will help to keep up a supply of fruits until the end of September. These

trees should be kept thinly trained, no shoots being retained unless they are needed for next season. Late trees should be grown in sound loam, not over-rich but made thoroughly firm so that the roots have to work for their sustenance, otherwise thorough ripening of the wood, which is essential to success, will not be achieved and liquid manure and artificial fertilisers will be wasted.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Papaver nudicaule.—Seeds of Iceland Poppies and of the new Sunbeam and Coonara Poppies, should all be sown during August or early September for flowering next year. They may be sown in boxes in cold frames, afterwards pricking out the seedlings and, when large enough, planting them in their flowering

pits. Pentstemons planted in the reserve garden for stock purposes, should not be allowed to flower, the aim being to secure a fine crop of cuttings for propagating.

Bedding Arrangements.—While summer bedding plants are at their best is the proper time to sit in judgment on the present arrangements, and consider what improvements or changes may be made for next year. It is important to make an early decision on this matter and thus allow plenty of time to propagate the necessary stocks, as with many subjects this must be done towards the end of August or beginning of September. When planning bedding arrangements their character and style will to a certain extent be determined by the lay-out of the garden and its immediate surroundings. It may have to be formal in character if the garden and surroundings are laid out in formal style, and this, to a certain extent, may restrict the choice of subjects. Where a garden is less

varieties is telling against them every year. Some praiseworthy attempts are being made to evolve a perpetual-flowering type of both Malmaison and border Carnations, but the results for one reason or another, have not yet become very successful. When the layers have been securely pegged into position and the sandy compost mounded up and well watered, a watch should be kept on them in case birds attracted by the new soil or the moisture, begin to scratch and work among them, leaving the stems exposed. Should this trouble be very pronounced it may be necessary to use old nets to exclude the birds.

Gladioli.—These beautiful flowers are now being used freely in bedding arrangements and are amongst our most handsome autumn flowers. They are best grown in fairly large beds and interplanted with dwarfier and bushier companions, such as the early-flowering Chrysanthemums or the dwarf bedding Dahlias now so popular, as the tapering spikes of the Gladioli, rise above the other occupants of the bed and their foliage also helps to prevent a flat effect. The primulinus section is well worth the greater attention it is now receiving, both for supplying cut flowers and for grouping in beds and borders, as small, hooded flowers are fairly widely spaced on the spikes and not so stiff as the large-flowered varieties. Where the latter are intended for exhibition purposes great care is necessary to protect the spikes from damage by the weather, and some ingenuity has been shown by growers in producing suitable glass fronted cases for this purpose; needless to say, none of these should be permitted in the garden, but kept in the reserve ground, well out of sight.

Amaryllis.—This large and interesting family is represented at the present time by the well-known *A. Belladonna*, whose pink umbels surmounting a stalk two to three feet in height, arise directly from the apparently dormant bulbs. These plants are best grown in full sun, either in front of glasshouses, or at the foot of a south wall, where they may be expected to become thoroughly ripened each season. Where *Habranthus pratensis*, now known as *Hippeastrum pratense*, is grown in the open border, the present is a most suitable time to lift, separate and replant, but only where absolutely necessary, as this flaming beauty resents disturbance, and if doing well is best left alone.

Nerines and Vallotas.—The Nerines are developing their flower spikes, and *N. Bowdenii* has been most successfully grown by several gardeners in our south-western district in the open, and although not yet tried here, there is no doubt that it will be ere long. The Scarborough Lily, *Vallota purpurea*, is another bulbous plant which might be tried outside with every prospect of success, as it is comparatively hardy, and if given a light soil it would probably come through our mild winters equally as well out-of-doors as it has done during recent years in cold houses.

Onions, Cauliflowers, etc.—The sowing of many kinds of vegetable seeds, such as Onions, Spinach, Cauliflower, Lettuce, Parsley, etc., should now be made, in order to have the plants well-established before winter sets in. At this season sowings should be made rather more thickly than in spring sowings; Onions, especially, seem to winter much better when growing close together in the rows. The Prickly-seeded form of Spinach is the best for withstanding the winter. The ground need not be further enriched for any of these crops, if in fairly good heart, as it usually is after a crop of Potatoes. Cauliflower and Lettuce sown now may, in most cases, require to be lifted when small and pricked out into boxes or frames where they may be protected during inclement weather, but a few of each should be left outside all the winter for trial, as our experience is that these often keep remarkably well, while Lettuces, especially from this sowing, provide splendid salading quite early the following year. Parsley is one of our most troublesome crops, as a rust attacks the roots and renders the plants useless, especially from spring sowings, but if sown now on firm land, it appears to escape the worst ravages of this trouble, and provides a good crop of garnishing material.

FIG. 60.—GAULTHERIA OPPOSITIFOLIA.

(see p. 148).

quarters; or they may be sown directly in the open ground—where they are required in quantity for a supply of cut flowers this is undoubtedly the best method, especially with the commoner and less expensive strains. Sow the seeds thinly in the reserve garden, afterwards thinning the seedlings to one foot apart in the lines; grown in this way, without any root disturbances, fine plants are produced which provide a wealth of material for decorative purposes.

Antirrhinums and Pentstemons.—Care should be taken to cut out old flower spikes; this is very important, for, if allowed to remain on the plant and produce seeds, they retard secondary growth and successional crops of flowers. The many fine varieties of Antirrhinums now come so true from seeds that it is unnecessary, as in the past, to increase any particular variety by means of cuttings, although this method may still be used where a pure stock is necessary for a colour scheme. Where Antirrhinums are required for an early display next year the seeds should be sown during August or early September; the young plants should be placed in their flowering quarters in time to become established before winter. Small, sturdy plants are most likely to come through the winter successfully. In damp, low-lying situations it may be necessary to winter Antirrhinums in cold frames or

formal in character or consists of a more or less isolated series of beds, a much wider variety of plants may be used. Generally, bedding arrangements should be as simple as possible, but in this connection the taste and wishes of the owners must be considered. In making new gardens or beds it is very important to keep the shape of the beds as simple as possible, as this greatly facilitates working operations of all sorts, from mowing to digging and planting.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Layering Carnations.—It is not yet too late to layer Malmaison and border Carnations, but the work should be proceeded with at once in order to produce useful plants for potting up towards the end of September. Souvenir de la Malmaison Carnation has lost its popularity in comparison with the perpetual-flowering race, and the reason is not far to seek, as the former, like the border type of Carnation, can only be depended on to produce one crop of flowers annually, and although these are very beautiful in their season, the blank of nine months which they leave to be filled up by the perpetual

ORCHID NOTES AND GLEANINGS.

VANDA TERES.

THIS is a most beautiful Orchid and one that flowers freely during the summer when well-grown. It requires special treatment to induce it to flower regularly, as it makes its growth rapidly during the hottest part of the year; hence there is no great difficulty in satisfying its requirements.

So soon as the flowering period is over growth begins, when the work of repotting should receive attention. When growing this Orchid it is advisable to fasten the stems to light teak rods, or some other hard wood, to which the roots may attach themselves. The stakes should be fixed firmly in a pot, which should be filled two-thirds of its depth with crocks for drainage, filling the remainder with clean, chopped Sphagnum-moss pressed firmly.

The stakes should be of sufficient length to allow for eighteen inches or so of growth. The plants may either be placed singly in pots or several together to make large specimens.

Where sufficient plants are grown, it is a good practice to plunge the pots in a bed of live Sphagnum-moss, as then constant moisture and efficient drainage are maintained, and if the bed is provided with bottom heat so much the better.

Vanda teres should be grown close-up to the roof-glass, and be frequently syringed with tepid soft water to encourage free, rapid growth. Established plants need no shading and on bright days in summer the temperature may be allowed to rise to 100° to 110° F., which, with abundance of atmospheric moisture will create conditions under which this plant revels.

When growth is completed the temperature and the humidity of the house should be gradually reduced, and only sufficient water given from time to time to prevent shrivelling, keeping the plants still exposed to all the light possible to consolidate and ripen the newly-made growths.

During the winter the plants are best rested in a dry house having a temperature of 55° to 60°.

Of the special forms of this beautiful Orchid Vanda teres alba and V. teres gigantea have been awarded First Class Certificates by the Royal Horticultural Society, while V. t. Gunnersbury Park variety has received an Award of Merit.

CATTLEYA WARSCEWICZII.

THE different varieties of this most useful Cattleya generally produce their flowers in July and August, but it is not unusual for flowers to appear in May and June, so that the flowering season of this grand species covers nearly one-third of the year, and at a season when Cattleya flowers are scarce.

It is to a few select varieties of this fine Orchid that I particularly wish to direct attention. The geographical range of the species is considerable, but in spite of this the forms brought from the different localities resemble each other closely, so that when a particularly distinct variety appears it is extremely valuable to the hybridist. In the past, the different albino forms of the various species were much sought after and greatly prized, but now, by a careful selection of parents, these are as easily raised as the coloured forms.

The numerous white forms of Cattleya Warscewiczii, although not strictly speaking albinos, have been the parents of a race of lovely hybrids which produce flowers with pure white sepals and petals, and highly coloured lips, a combination considered impossible in the early days of raising Orchids by artificial means, when the colour of the lip was expected to effect the whole flower.

Many hybrids from the typical C. Warscewiczii had been raised before the introduction of C. W. Frau Melanie Beyrodt in 1904, but this has proved one of the best parents.

Amongst the most popular of the hybrids raised from this variety are C. Hardyana alba,

C. Dionysius alba, C. Haroldiana alba, C. Enid alba, C. Hestia and many Laelio-Cattleyas.

C. Warscewiczii alba (Firmin Lambeau), a pure albino was introduced about 1912, when it received a First Class Certificate from the Royal Horticultural Society on July 16 of that year, and caused a great sensation at that time. The first hybrid from it, Cattleya The Bride, appeared in 1919, but this particular form has not been grown to the same extent as some of the others. Amongst the most distinct varieties besides those mentioned are C. W. Mrs. E. Ashworth, C. W. Low's var. C. W. limbordiensis, C. W. Othello, C. W. Rosslyn var. and C. W. White Queen.

C. Warscewiczii and its hybrids are best repotted soon after their flowers are over, in the ordinary Cattleya compost, keeping the plants on the dry side until they are well rooted. During their season of active growth they enjoy a slightly warmer position than the majority of Cattleya species. J. T. B.

FLOWER GARDEN.

ANNUALS.

WHILE some of the most popular annual flowers have been very poor during the present season, others have been noticeable for their sturdy growth and wealth of bloom. Asters are almost a failure owing to persistent attacks of stem-rot. Ten-week Stocks are not good; some of the plants have died, while others have made abnormal growth and become unwieldy. This applies to plants growing in various positions and in both manured and unmanured soil. The growth of Dianthus of the Heddiwigii section, treated as annuals, has been stunted and few flowers have been produced at the time of writing, August 8.

Antirrhinums grew very slowly after being planted but are now growing freely and producing a wealth of bloom. Zinnias, on a sheltered border, produced some fine flowers, but the plants are not growing freely, nor forming that branching habit which is the prelude to a continuous show of bloom during the autumn. Wet weather has caused some of the flowers to decay, and where these have not been removed the stems have rotted and the plants collapsed.

It is pleasant to turn to subjects which are giving every satisfaction, and noticeable amongst these are the Nemesias. A strain which has proved very serviceable for beds is the new dwarf Rainbow, which was Highly Commended at the R.H.S. trials in 1926; this type of Nemesia can be confidently recommended. Statice sinuata has grown freely and is now commencing to flower. African and French Marigolds are very good, although growing in positions not wholly favourable to their full development. Some are planted in a border in front of shrubs, others in a bed carpeted with Viola Maggie Mott which has grown somewhat rampantly. Annual Chrysanthemums sown on a sunny border during March have provided abundance of material for cutting. Nigella Miss Jekyll has been conspicuous on the same border, while Lavatera Loveliness, a very richly coloured form of Lavatera rosea splendens, is fine, the glowing flowers and bronze stems combining to make this Mallow very effective for indoor decoration. Stems may be cut from two to three feet in length.

Helichrysums of a refined pink shade are admired; these Everlasting flowers are best cut before the flowers are fully developed. The strong-growing Godetias have been useful for cutting; some of the new shades found in this annual are very pleasing and distinct, notably those in lavender and pink. Long spikes which carry fifteen flowers, or more, and which will last for several days when cut, are very useful. Sweet Peas grown on the single-stem system have produced good flowers, but the foliage of the plants has suffered from the effects of cold and windy weather, so that many of the leaves are now yellow and sere. C. Ruse.

CAMPANULA SPECIOSA, POURR.

I WAS a good deal puzzled when collecting on Monserrat (Barcelona) last spring, by a large, handsome-looking species of Campanula. It grew sparingly on limestone cliffs, about half way up the mountain, and a few specimens were also growing in coarse scree. The plants were not then in flower, but several still carried skeletonized flower spikes of the previous year, and there were some of them so much as two feet high, suggesting something in the nature of a Canterbury Bell. Yet the species was obviously and definitely perennial. I had never seen a Campanula like it.

The cliff-dwelling specimens hung from the crevices with long, finger-thick stems that were evidently a great age, for the "trunks" were thickly clothed with the matted remains of past generations of dead foliage. They sprawled and dangled down the cliffs a foot and two feet in length—a most interesting sight. In the scree-haunting specimens the "trunks" were usually buried in the downward drift of the coarse rubble.

I brought home a dozen or so roots of this remarkable plant, and these were readily established in pots and in the open rock garden, and quite soon each specimen developed a rosette of long, narrow leaves, roughly suggesting the foliage of Campanula grandis.

In July some of the specimens pushed up flower spikes, and by the end of the month I was able to form an opinion of the possibilities of this Campanula. This opinion was far higher than I had dared to hope. It was not to be expected that plants so recently collected would flower with the vigour and splendour of the great skeleton spikes I had seen on Monserrat. That splendour should be reached and surpassed in future cultivation, when the plants are fully established and can blossom after a whole season of unchecked growth. But the flower spikes I did have were not merely promising but definitely handsome and attractive. The best rose to eighteen inches in height and was strung from top to bottom with large, shallow, cup-shaped blossoms, as large as those of Campanula grandis, or possibly rather larger, but not so shallow. The colour was a fine, luminous, lavender-blue.

The outline of the whole inflorescence was less pyramidal than that of the wild specimens I had seen, and therefore less impressive, but this, no doubt, was due to a certain extent to stunting, a result of transplanting and travel. Given a fair chance, C. speciosa should make a remarkably handsome plant, either for the herbaceous border or for the bolder parts of the rock garden.

I was able to send a flowering specimen to Professor Wright Smith at Edinburgh, who stated that it is Campanula speciosa, Pourr. Apparently there are at least three plants to which the name of C. speciosa has been given, and doubtless my plant is the true C. speciosa.

I have grown a plant labelled C. speciosa at Stevenage, like a small Canterbury Bell; a good plant, as Canterbury Bells go, and, as Canterbury Bells go, it went, being biennial. I took a hurried look through Farrer's *English Rock Garden*, but my true C. speciosa does not appear to be mentioned or described there.

For some little time I shall be beyond the reach of serious books of reference, though I look forward to being found by—from time to time—copies of *The Gardeners' Chronicle*, and I should therefore very much enjoy finding a note in these pages on the various C. speciosas, both the false and the true!

It is surprising that so handsome a plant and one so easily established and grown should be so little known. It would be interesting to know if it was in cultivation in England at the time of my collecting it, and it would be very interesting, if anyone grows it, to learn their experience of the plant.

Campanula speciosa, Pourr., the true perennial species, promises to be as good a seed-bearer as the false, biennial C. speciosa, and I think too, it will not be difficult to increase by root cuttings. Clarence Elliott.

ALPINE GARDEN.

SYMPHYANDRA PENDULA.

A NATIVE of the Caucasus, this hardy herbaceous plant is well suited to the rock garden, or failing that the front of the herbaceous border. Free of growth, it forms a large root-stock from which arise masses of long-petioled, ovate or heart-shaped, velvety leaves. The branched flower stems are sometimes erect, but are usually semi-prostrate or pendulous. They are hairy, and clothed with sessile, ovate and deeply serrated leaves. The large, drooping, campanulate flowers are creamy-white in colour and very beautiful, being produced freely during July and August.

Symphyandra pendula should be planted in deep, loamy soil, and if grown in the rock garden should be given a sunny site, above the

Chumbyi have handsome grey leafage which makes them highly decorative, either in or out of flower. *Arabis albida* and *A. aubrietioides* have also a decidedly grey tint in their foliage.

The genus *Artemisia* provides a wealth of silver-leaved plants, many of which are of too strong growth for the rock garden, but *A. frigida* is worthy of a place, its finely cut foliage being of dainty appearance and creating a graceful, silvery effect. *A. canescens* is also an attractive plant but needs ample space and must be prevented from encroaching on others. *A. sericea* and *A. lanata* var. *pedemontana* are also valuable and will succeed in any ordinary well-drained soil. *Acantholimon venustum* is a handsome plant which builds itself up into a mass of grey foliage and looks particularly well when established in a crevice. *Cerastium tomentosum* has attractive grey foliage, but it is a spreading grower and frequently a danger to small, choice plants. *C. alpinum lanatum* is a much less

being almost as beautiful as their flowers. *Santolina incana* is a grey foliaged plant of outstanding merit, and although too strong-growing for the rockery proper, positions may be found for it in the background with advantage. *Raoulia australis* makes a neat, glistening, silver carpet, and succeeds well on warm, sandy soil.

Other plants with grey foliage suitable for positions in the rock garden include *Scabiosa pteroccephala*, *Pentstemon Davidsonii*, *Wahlenbergia pumilio* and *Zauchneria californica*, while *Papaver alpinum*, *Primula auricula* and several of the *Sedums* have foliage of a pleasing glaucous green. A. P. C.

DAPHNE CNEORUM MAJOR.

LOVELY as is the typical *Daphne Cneorum*—despair of so many gardeners—still more delightful is the variety *major*, which appears to

FIG. 61.—PRUNUS HUPEHENSIS.

(see p. 148).

eye level, in which position it will be seen to advantage. It usually ripens an abundance of seeds which germinate freely. This plant was a great favourite with the late Mr. Reg. Farrer, who waxed eloquent in his description of it; it is figured and described in *Sweet's Flower Garden*, Series II, t. 66. A. G. F.

SOME GREY-FOLIAGED ROCK PLANTS.

THERE is always a special attraction about silver or grey-leaved plants, as they contribute interest and brightness to the rock garden at all seasons; but in the late summer months when few denizens of the rock garden display their blossoms, these grey-leaved subjects contrast finely with the masses of green foliage which usually predominate.

Several of the *Achilleas*, notably *A. ageratifolia*, *A. argentea* and *A. umbellata*, have beautiful soft-grey foliage and are well adapted to sunny positions. *Alyssum saxatile* and its varieties *citrinum* and *compactum* are equally beautiful after as during their flowering season, because of their bright grey foliage. *Androsace lanuginosa*, *A. sarmentosa* and *A.*

rampant plant, and although almost green in the growing season, becomes almost enveloped with silvery, woolly hairs when the growing season has come to an end. *Dianthus caesius*, that fine British plant, gives dense cushions of pure grey foliage which remain attractive during the rest of the year after the clear, warm, pink flowers have passed, *Erodium chrysanthum* produces generous tufts of silvery, fern-like foliage and is a fine plant. *Draba scabra* (syn. *scandinavica*), the flowering period of which extends to August, has beautiful grey foliage. *Helichrysum bellidioides* and *H. trinervatum* are neat little plants with silvery foliage as also is *Leontopodium alpinum*.

Hieracium villosum has distinct grey foliage, while *Hypericum fragile* and *Linaria alpina* are a beautiful glaucous green. *Nepeta Mussinii* is one of our most valuable grey-foliaged plants, and when established on a wall or in a crevice where it does not grow too freely, is a constant source of colour. *Potentilla nitida* is a choice little plant which makes a carpet of shining, silvery leaves. Most of the encrusted *Saxifragas* have grey foliage, their silvery rosettes

grow with more freedom and to be less subject to vagaries than the type. The latter is difficult to establish in some gardens and even when it looks accustomed to its conditions, may die off unexpectedly, but the *major* variety grows more freely and has a different habit. Instead of the straggling growths of *D. Cneorum* itself, it forms a neat bushlet, giving freely of its brilliant rosy, trumpet flowers, which are such a joy to the plant lover.

D. Cneorum major is not too common, but it is really a fine plant, and deserving of a place in any rock garden. As for soil, I have seen both the type and the *major* form doing well in stiff loam without any lime, but those who have trouble with either might well try the lime treatment recommended by the late Mr. Farrer. Leaf-soil and lime in some form are what he suggested and his experience is always worth taking into account in considering the ways and means of cultivating troublesome but exquisite alpine flowers. I have seen *D. Cneorum* and *D. C. major* thriving well in sun or shade, although partial shade would seem to be the ideal condition. S. Arnott.

TWO CHINESE CHERRIES.

RELYING upon the synonymy used by Wilson in his *Cherries of Japan* (p. 29), I originally associated the Cherry he had collected in Hupeh, Western China, with the indigenous species of the central provinces of Japan, and furthermore, suggested that it might belong to the form called by Miyoshi, *Prunus mutabilis stricta* (c.f. my "Notes on Japanese Cherries," *Journ. Roy. Hort. Soc.*, Vol. L.). I remarked, however, that it was "markedly different from my imported Japanese seedlings."

With increased knowledge, this difference became even more apparent. When I wrote the above-quoted article I had not had an opportunity of critically examining the Japanese Hill Cherry in flower, but during my recent visit to Japan I saw many thousands of them growing naturally or under cultivation, and am now convinced that the Hupeh Cherry (Fig. 61) is sufficiently distinct to be given specific rank. It has several characteristics which are readily observable in life, though probably difficult to detect in herbarium specimens. Of these the uniform pink colour of its flowers is, perhaps, the most important. In the Japanese Hill Cherry the blossom is almost invariably white, the petals in freshly opened flowers being only very occasionally stained with pink. The two plants are also of different habit, the Hupeh Cherry having more upright, twiggy boughs, which are paler grey, while in the autumn the foliage turns to a darker hue and dies off a deep wine-purple colour.

The leaves of the Hupeh Cherry resemble those of the true *Prunus serrulata* of Lindley in form, colour and texture. The blade is generally narrower, smaller and more elliptical than in *P. mutabilis*, and is of a paler green shade. For this Hupeh plant I suggest the name *P. hupehensis*. Type locality: Chang-yang, Hsien Woodlands, Western Hupeh (seeds collected by Wilson, No. 349). It is a highly ornamental tree, both in spring and autumn, and is of considerable garden value.

In *Plantae Wilsonianae* (Pt. II, p. 209), Koehne described another Cherry, likewise collected by Wilson in the Chang-yang Hsien woodlands as *Prunus tenuiflora*. This plant Wilson has also merged with the Japanese species. The only specimen of *P. tenuiflora* in my possession (a descendant of a plant raised at Aldenham from seed No. 3A) is quite distinct, from anything I saw in Japan, and in my opinion Koehne's name should stand. This Cherry has pink flowers, relatively large, rugose leaves (which, together with the rest of the shoot are densely downy when young) and persistent foliaceous bracts on the fruiting stalks. *Collingwood Ingram*.

PYRUSES AS STREET TREES.

WITH garden cities and new housing schemes springing up throughout the country, the problem of suitable trees for modern streets or roadways is one that is causing public authorities some anxiety.

Trees that were planted from thirty to sixty years ago in streets and high-ways are often a public nuisance. In many cases they are situated on the pavement edge, and when the gas, water or cable companies come along, each digging its own track, the result is that all the roots on the pavement side are cut and the tree deprived of nourishment from that quarter. The roadway at the time of their planting was probably composed of rolled-in metal, through which a fair amount of rain water could percolate. Such roads have now been covered with bitumen, or some such substance, forming an impervious surface. Under these conditions any tree with an elaborate root system fails, and becomes a public danger through dead branches and instability at the roots. Such trees as Beech, Lime, Sycamore and Elm require a lot of head room, and their overhanging

branches interfere with overhead wires and obstruct the light from occupiers of houses in the vicinity, while the litter caused by falling leaves is a source of constant complaints.

The ideal street tree is one that does not produce heavy limbs and spreading branches, yet it must be fairly rigid, not easily damaged by wind, and respond to pruning and trimming. The falling leaves should not cause any greasiness to the road surface, such as those of the Lime are apt to do. Moreover, the ideal tree must be able to withstand a smoky atmosphere and yet be decorative and shapely while requiring a minimum of attention and subsisting in a restricted root run.

Many of the *Pyruses* are suitable, provided the soil conditions are good. Most of them are not in the least fastidious as to soil and grow well amidst city smoke, and are most decorative. In certain varieties the leaves are beautiful and there is a profusion of flowers, while in the autumn the clusters of bright red or yellow fruits, and the brilliant colour of the leaves are added attractions. In fact, they are so attractive that children and older folk often break off the flowering or fruiting branches. Probably if they were more grown the residents would accept them as part of their everyday life and leave them alone. *Pyrus* used for street decoration should, so far as possible, be raised from seeds. Many of the finest varieties are propagated only by grafting or budding, and in most cases they are not to be recommended for street planting. The stock usually employed for that purpose is *P. Aucuparia* (Rowan), and it is a very bad one for suckering. Any variety that is top-grafted is useless for street work. Where the union is several feet high a large swelling usually appears, and above it the stem is much thicker than below, giving the tree a top-heavy appearance. Below the union the stem has a hide-bound appearance and it requires constant attention in staking, being unfit to stand by itself.

Trees planted in streets should have at least eight feet of clear stem, and as they grow up the bottom branches should be removed until twelve feet to fourteen feet of clear stem is obtained. This pruning should not be done too hastily as any hurry in this respect reduces the sturdiness and rigidity of the stem.

Pyrus Aria, or Whitebeam, has an average height of thirty to forty feet and is a native tree. Mr. Bean, in his *Trees and Shrubs Hardy in the British Isles*, states, "there is no tree more characteristic of the chalk hills of Britain." Here it grows remarkably well in soil that is in no way calcareous, provided the site is well drained. There are various forms, and all are attractive trees. Usually the leaves are large, oval in shape, two to four inches long and half as much wide, covered with a white down underneath, delightful glimpses of which are shown during a breeze. The young shoots, in the spring, are heavily felted, giving the tree a beautiful silver-white appearance. This is followed in May by large clusters of fragrant white flowers, and in the autumn the reddish-brown fruits and rich colouring of the leaves are equally decorative. The variety *Majestica* is the most effective; the leaves, while showing the usual characteristics, are more tapering and much longer, often up to seven inches long. The fruit is slightly smaller than in the type and of a brighter red in colour. When raised from seeds a large percentage show the true character.

Pyrus intermedia, the Swedish Whitebeam, is a tree of usually twenty feet to thirty feet high, and does very well in the city. The young, downy shoots and leaves are very attractive. Judging from the several thousand four-year-old seedlings here, it does not make such sturdy growth as other kinds, and greater care has to be given to the training of the young trees to ensure stout, straight stems. Here, it has proved itself to have a first-class constitution for town planting; it is shapely, flowers freely in May and carries red fruits in the autumn.

Pyrus latifolia (Service Tree of Fontainebleau), commonly known as *P. rotundifolia*, is a most interesting tree and of very fine appearance; the general shape of the head is all that could be desired, and in the writer's experience it promises

to be the best tree in this class for street planting. *P. latifolia* is believed to be a hybrid between *P. Aria* and *P. Torminalis*. There are various forms of it, varying in the appearance of the leaves. The general outline of the tree, the way in which the branches radiate from the leading stem, and the root system, though quite distinct from those of other *Pyruses*, is the same within the type, no matter how much the leaves may vary. Of nearly 1,000 four-year-old trees raised from seeds here, two distinct types (in leaf only) are noticeable, and in the deciduous stage they cannot be distinguished. In the spring, the young leaves of the two types are distinct in character; in the one the leaves are ovate in outline, two inches to four inches long, nearly as much wide as long across the two wide marginal lobes at the base, the apex pointed margins jaggedly toothed, smooth, dark green above, covered beneath with greyish felt. The other type of leaf is felted on both sides while young; leaves roundish-ovate, margins not so jaggedly toothed and without marginal lobes at the base. The first type shows affinity with *P. Torminalis*, and the latter to *P. Aria*.

At the time of writing (July), one can hardly be distinguished from the other, as in both the terminal leaves of the current year's growth are identical.

P. Torminalis, or Wild Service, is a tree usually thirty feet to forty feet high. Unfortunately, there are no young trees here, although there are two fine specimens in one of the parks in the heart of the city. The flowers are produced in June in large corymbs and are very fragrant and white. The tree is in every way attractive, and the leaves resemble those of a Plane; indeed, I was once asked what kind of Plane tree it was. It is difficult to understand why *P. Torminalis* is not more grown, as it is a native tree, does well amidst city smoke, has a striking appearance and splendid habit, all making it a valuable tree for street decoration.

Pyrus pinnatifida, generally believed to be a hybrid between *P. Aucuparia* and *P. intermedia*, is found wild on the Isle of Arran. It generally makes a tree about twenty feet to thirty feet high, and has leaves of a very pleasing shade of green on the upper side, the under side being covered with a grey felt. The fruit of this tree is very showy, bright red and bigger than that of the Rowan. This splendid tree is like *P. Aucuparia* in the stem, but the branches are more ascending than in the Rowan.

Pyrus Aucuparia, Mountain Ash, or Rowan, is too well-known to need description. It deserves to be more extensively planted by the sides of streets and roads. *W. G. Robertson, Glasgow*.

TREES AND SHRUBS.

STAPHYLEA HOLOCARPA.

THIS deciduous shrub was first discovered by Professor Henry in the Province of Hupeh, Central China, but it was introduced to cultivation by Mr. E. H. Wilson, when collecting for the Arnold Arboretum. The leaves are composed of three leaflets, all finely toothed, and downy at the base beneath. The white or pinkish flowers are produced in broad corymbs. Flowering sprays of this species have been exhibited on several occasions at the meetings of the Royal Horticultural Society, and some of these have been shown by Mr. F. J. Hanbury, of Brockhurst, East Grinstead, whose largest plant is now about eight feet high, and is illustrated in Fig. 59.

GAULTHERIA OPPOSITIFOLIA.

ALTHOUGH *Gaultheria oppositifolia* was discovered by Sir Joseph Hooker nearly seventy-five years ago, it has not yet become popular in cultivation. It is a native of the mountainous regions in the northern island of New Zealand, consequently it is only suitable for cultivation in the British Isles in localities

where the somewhat tender Rhododendrons are a success. In its native habitat it will grow so high as eight feet, but it rarely reaches this dimension in this country. The sessile, heart-shaped leaves are usually opposite, although sometimes they appear to be in whorls of three on the stronger flowering shoots. The little urn-shaped flowers are white and produced in terminal branching panicles. An illustration of this species was given in *The Gardeners' Chronicle* of August 10, 1912 (Fig. 43, p. 109), from a drawing by the late Mr. Worthington Smith. It was made from a specimen supplied by Mr. T. Smith, of Newry, to whose son we are also indebted for the specimens illustrated in Fig. 60, this figure being a reproduction from a photograph.

CLERODENDRON FOETIDUM.

THIS handsome shrub is hardy in favoured localities, although often killed to the ground level by severe frost, so it is often more herbaceous than shrubby. The pinkish or lilac-rose flowers are produced in August in dense terminal corymbs; the leaves are of considerable beauty, large, pubescent, cordate, acuminate, toothed, on slender petioles. The reddish colouring of the young terminal leaves in late summer is an attractive feature.

At Kew the plant is killed back to the ground every winter, but Mr. Bean in *Trees and Shrubs Hardy in the British Isles*, states that it sends up new shoots in summer up to six feet in height.

Clerodendron foetidum is armed with short, rigid spines, and when the leaves are bruised they emit an odour not unlike that of Almonds and, to my sense of smell, somewhat pleasant.

This plant is very handsome when doing well in a half-shaded, sheltered and somewhat moist situation. It was introduced from China in 1820, is synonymous with *C. Bungei* and is figured in *Bot. Mag. tab. 4880. Ralph E. Arnold.*

NOTES ON CONIFERS.

XXIII.—A NEW VARIETY OF CUPRESSUS LUSITANICA, MILLER.

SEVERAL forms of this variable Mexican Conifer are cultivated in this country, especially in the mild climate of the west of England, where one often sees handsome trees of it. The variety here described has puzzled me for some years; it is based on a tree which has been growing since 1915, in the Crawley Nursery, on the Duke of Bedford's estate at Woburn, Bedfordshire. I obtained it as a small plant from Messrs. Hillier's nursery at Winchester, where it was cultivated as *Cupressus Benthamii* var. *chamaecyparoides*.

After eleven years' growth it is now a thriving, handsome tree about fifteen feet high, which bears numerous cones every year. We hope shortly to raise seedlings.

It is very distinct in habit, but is undoubtedly one of the numerous forms of *Cupressus lusitanica*, exactly resembling the variety *filifera* of *Cupressus pisifera* in its long, pendulous branches, which terminate in bi-pinnate divisions. The leaves are awl-shaped, and slightly spreading at the tips, larger and more spreading on the secondary branchlets; cones large for the species, up to three-quarters-of-an-inch in diameter. Miss Lister's careful drawing (Fig. 62) shows well the long, whip-like branches which characterise the variety. I have not met with it in any English garden, but Mdlle. Camus who some years ago gave to the world an excellent *Monograph* of the genus *Cupressus*, says she is familiar with this form, both as a subsontaneous and introduced tree in mid France. I propose to call this form *Cupressus lusitanica* var. *flagellifera* mihi, with the following diagnosis:—

Arbuscula habitu C. pisifera var. *filifera* similis. Ab *C. lusitanica* typica ramulis ultimis longioribus pendulis recedit. Woburn.

Analagous forms are *Cupressus Lawsoniana* var. *filifera* and *Thuya orientalis* var. *pundula*. A. Bruce Jackson.

FIG. 62.—CUPRESSUS LUSITANICA VAR. FLAGELLIFERA. (Natural size).

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would oblige by delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand;" or by telephone, to Gerrard, 1543.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA*

XIV.—DOMESTIC AND OTHER MATTERS.

JULY began very wet at my camp, and I became restless and anxious to break new ground. From time to time the headman arrived from the village below, bringing me butter, milk, or a few mislaid eggs; once I even bought a goat from him for R.8. (about twelve shillings), and some small Potatos. The servants were alternately sick with fever, quarrelsome between themselves, or bolshevik with me; in fact, they became so whole-heartedly communistic that my stores and rations, began to dwindle at an alarming rate. Of course, it was impossible to lock up the rations, as my steel boxes were required for more valuable specimens and silver, and other steps had to be taken to stop the rot. In the selection of servants I had had little choice, so difficult was it to persuade anyone to come to these pestilential wilds, let alone stay there. They missed the bazaar, chat, the company, the dancing girls and the picture palace at Myitkyina. But my aim had been to engage a job lot, who were likely to be mutually repulsive, as there was then less opportunity for combined general action against me. Thus my Kachin body servant, Laphai Nong; Burmese cook, Maung Ba; Nung *chokara* ('little boy'), and Nung cooly, were fully up to specification, and all hated each other with a truly unbrotherly affection; but the full advantage of this was somewhat discounted by the fact that they spoke a common language amongst themselves in the lingua franca of the country, namely Kachin, of which I understood not one word. As for Maung Ba, the bad man, he could conspire in Ming (of which Laphai was ignorant) and swear to himself in Laphai.

From time to time I had to send my cooly down to the base camp for something or other, but the order had to go through Maung Ba,

who had a playful way of adding an order, as from me, of course, for a tin of tea or a bottle of rum on his own account. Not that that mattered much, so long as peace and order

The headman had promised me transport for the journey, but always it was coming to-morrow, never did it actually come to-day. Meanwhile, I was waiting for a letter from the

FIG. 63.—AT THE HEAD OF THE BRANCH VALLEY, UPPER SEINGHKU;
12,000 FEET ALT.

Lapponicum Rhododendrons scattered over the sandy floor of a silted lake.

were maintained, but the practice led to black-mail and much mutual recrimination, because Maung Ba had no desire to share his triumphs with lesser fry, and the lesser fry revenged themselves by turning King's evidence. In short, my plan worked admirably; I never have had a staff who lost so little love amongst themselves. I let them hate each other, but chid them unmercifully if they ever pointed hate in my direction. The jobs they had to do for me were not very exacting, but I did insist on the following: meals at the recognised hours, with enough to eat, the food clean and as pleasant looking as circumstances permitted; warm, dry clothes so soon as I returned from a climb, and dry clothes to put on in the morning. The fire kept up in my hut, and a plentiful supply of fire-wood; the hut tidied and swept while I was out; the roof kept water-tight, and my bed made. The plant paper changed every day, and a supply of dry paper always available. Whatever else they did or left undone, the above programme had to be carried out daily, otherwise there would be strife. In that climate, much of the work resolved itself into cutting and drying fire-wood in sufficient quantity. Meanwhile, I had made casual enquiries of the headman as to how far it was to the Lohit river, on the other side of the range, what were the conditions, and so forth; I intended to go there, but assumed an air of complete indifference, because whenever I mentioned the Lohit, he looked at me with a quizzical air, and spoke with a certain awe, as though it were a most desperate enterprise; and of course, most of the tribes do look on Tibet as a sort of Arabian Night's entertainment.

Burma Government, to whom I had applied for permission to return to India by this route; but first the Government of India had to be consulted and sanction sought from the other local government directly concerned, namely, Assam. All this took time, but it was advisable to do the thing through the proper channels, and as I had good reason to believe that permission would be granted, there could be no harm in crossing the Diphuk La and dropping down to the Lohit on a preliminary reconnaissance, thence returning to my camp in the Seinghku valley. July was selected as the best month for the purpose, because by that time I had found most of the good things in the Seinghku valley; and if I put it off any later, there would be nothing left in flower on the other side.

During the first week of July the big *Meconopsis* flowered and proved to be a new species of the 'Grandes' group. The large, nodding flowers are borne singly in the axils of the leaves all the way up the stem (except at the extreme base) forming a column six feet high. Thus the habit is more like that of the single-flowered form of *M. paniculata* than of *M. Wallichii*. The petals are bright violet with a silky sheen, the anthers golden yellow and, though biennial, *Meconopsis violacea* (K.W. 7207) is a fine plant.

Much earlier than this I had seen a *Meconopsis* in fruit on the barer gravel patches amidst dwarf *Rhododendron*, which clothed a steep, exposed slope, *M. impedita*, I thought—a plant scattered over the mountains of Sino-Himalaya from Szechuan to the gorge of the Tsangpo. A little later I met with odd plants in flower, and the flowers were red, but I regarded them as abnormal. However, in July, up the valley between 11,000 and 12,000 feet altitude,

*The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, and July 30, 1927.

every scree was dotted with the plant, which sent up a little shower of ruby, or port-wine coloured flowers, each nodding on a single, wiry stem; and when a chance sunbeam

more abundant towards the base where the soil was deeper; indeed, where the underlying gravel came through the top soil it was replaced by a very different species, namely, the elegant

The drifts of 'Claret Cup' swinging and shaking their tiny bells, clustered in twos and threes on thread-like stems, as the dense mist came lashing up that slope, were an unforgettable sight, and close by were cushions and carpets of the 'Violet Primrose' (K.W. 6928). This last is related to the Chinese *P. sonchifolia*, and also to the better known *P. Winteri*, though the colour is much deeper than in the last-named. But the 'Violet Primrose' is a true alpine from 13,000 to 14,000 feet, and is not, like *P. sonchifolia*, found in the forest; a fact which may be to its advantage in this country. It is a plant which might grow in the bog so long as the soil is not acid. I noticed one or two white flowered plants. At the foot of the slope were strewn a few boulders, on which grew scattered plants of a pretty pink 'Nivalis' *Primula*, a species closely resembling *P. calliantha*. The boulders were thatched with flaming mats of *Rhododendron repens*, and the *Primulas* bobbed up amidst the fire, making a wonderful colour combine, washed by the violet seas of the 'Petiolaris' *Primula*.

It was a most awful day, and the rain stung; also it was bitterly cold, and so thick that I could not see where to go next or how to climb the cliff to reach the head of the valley. Eventually I climbed a precipitous gulley, not knowing in the least where I was going, except that it was in the right direction, more or less, and presently found myself on a lofty ridge almost above the plant line.

Descending the other side, I came upon colonies of the tiny, violet *Primula kongboensis*, and tufts of dwarf *Rhododendron*; and lower down I found the feeble blue flowers of the flimsy, dwarf, *Meconopsis lyrata*. But it was not till I reached the foot of the cliffs (having nearly come to grief on a steep new slope) that I found another really prize plant. There was an open meadow here—it was really a gravel scree, but for a couple of months at any rate, the sheltered slope of the cone was so thickly overgrown with coarse herbaceous plants that 'meadow' best conveys the appearance of it; and amongst the flowers were *Nomocharis pardanthina*, *Meconopsis Baileyi*, *Primula sikimensis*, and many others. And suddenly I caught sight of a deep, port-wine-red *Meconopsis*, and then another, and another. I was thrilled; this was something new in my experience. The flowers were a rich red right through;

FIG. 64.—SUMMIT OF THE RANGE; IRRAWADDY-BRAHMAPUTRA DIVIDE; 16,000 TO 17,000 FT. ALT. SCRUB IN THE FOREGROUND.

drove through it, the flower shone absolutely scarlet. It was certainly a most beautiful thing, though my delight was sobered by the discovery that, like *M. impedita* itself, it forms a deep tap-root which goes far down into the scree, being usually two or three times as long as the plant is high; a sure sign of difficulty in cultivation. Curiously enough, after most careful comparison, I am unable to find any good character by which to separate this plant (K.W. 6974) from *M. impedita* itself, and am therefore naming it variety *rubra*. It is a plant worth persevering with, and coming from much lower altitudes than true *M. impedita* it may, of course, prove much more easy to handle.

One day, I decided to tackle a great, bare-looking cliff which I could plainly see from my camp, up the branch valley, as there might be something in the glen at its foot. So I went up the cattle path and came to a big torrent, which stopped me. A little higher up stream was a snow bridge, which looked none too secure, nor was it, for it gave way so soon as I stepped on it, my foot going right through, and I scrambled out just in time. Being unable to cross the torrent, I followed it up, till I came to a waterfall, and turning aside, climbed through a dense tangle of dwarf *Rhododendron* on the flank.

After some difficulty, I at last reached the valley above, and keeping along the base of an enormous cliff, to avoid the tanglement below, found a grassy slope absolutely violet with a fine *Primula* of the 'Petiolaris' type. From a big crown of leaves it sent up, like an enormous Primrose, an incredible number of flowers, each on a stalk. It grew in sheets of vast extent in the sticky, black loam of the steep gravel slope at the foot of the cliff, becoming

FIG. 65.—RHODODENDRON SCARLET LETTER, K.W. 6955.

This forms domed cushions on the hillside at 12,000 ft. alt.; Upper Seinghu Valley.

little jewel called *P. silaensis*, or 'Claret Cup,' a near ally of 'Cherry Bell,' found in Tibet in 1924. The 'Amethystina' *Primulas* are gems of the first water, but difficult beyond words.

no spots or streaks or rash of any sort, on stems shorter than those of *N. pardanthina*; also there were only two or three flowers on each plant.

I dug up a bulb; it was a good six inches down,

in very coarse soil—gravel, in fact, with a mixture of humus near the surface derived from decaying meadow plants. One could knead this soil like dough almost, and evidently it contained a fair proportion of clay; in fact, I did actually make a ball of it.

Now *Nomocharis* generally grows on a talus slope, or, at least, on a slope of some sort, below cliffs composed of gneiss or granite containing plenty of felspar, or other aluminium double silicates, which on decomposition would form clay; hence, the sticky nature of the soil—'tenacious' was the word I used at the time. As for the depth at which their bulbs are found that would easily be accounted for by the annual top dressing of decayed vegetable matter, as the meadow plants die and are pressed down by the weight of snow, which has a conserving effect; and sometimes by the addition of gravel from the splintering cliffs above.

But despite the layer of black humus above, and the clay below the ground, though soaking

The baskets in question are eighteen inches in diameter, and have been filled with plants propagated early in the present year. At the time of writing (last week in July) they are well furnished with trailing growths, from two to two-and-a-half feet in length, towards the ends of which the clusters of flower buds are rapidly developing, giving promise of a splendid display of rich blue blossoms a little later. The baskets are suspended from the roof of a greenhouse, and when it is remembered that the outside shade temperature on some days has been so high as 92°, it will be readily understood that the conditions under which this *Ceratostigma* is growing are somewhat tropical.

I may state that large numbers of this plant are grown in pots throughout the summer for the purpose of filling formal flower beds wherein they are planted immediately they commence to bloom. T. H. Everett, New York.

throat are the most desirable, for they are usually of more graceful habit, and the contrast of the white throat and surrounding colour is very effective. But the type which produces sturdier spikes of flowers that have the throats either stained or rayed with colour have a distinct value in the garden where colour mass is required, as well as in contrast to the others.

A good selection of the many varieties grown at the Victoria Tower Gardens includes Mrs. Matthew, bright pink with white throat; Mrs. Allsop, dull crimson; Fair to See, bright red with rays of carmine; Mauve Queen, mauve with white throat; Rosy Morn, rich rose with rayed throat; and Mauve Beauty, purplish-mauve with white throat; while, rather later to flower, there are Aldenham Pride, of deep colouring; Warthill, deep red; and Alex. Lafont. Each variety has a clear, but inconspicuous, label, and a neat edging of a red form of *Begonia semperflorens* makes a suitable margin to the excellent *Pentstemons*. A. C. B.

FIG. 66.—TIBETAN COOLIES ARGUING.

wet, was quite well drained, partly owing to its steep slope, and partly owing to its gravelly nature, for it was full of big stones and sand. The slope, of course, faced south, otherwise it would have been covered with scrub *Rhododendron* and other woody plants. This red *Nomocharis* was not at all common here, but subsequently I found a few plants higher up the valley, always scattered on steep gravel slopes below cliffs, and rare; the only rarer species was *N. nana*, of which I found about a dozen plants on a cliff. *N. pardanthina*, however, was abundant. F. Kingdon Ward.

CERATOSTIGMA PLUMBAGINOIDES AS A BASKET SUBJECT.

THE beautiful, blue-flowered *Ceratostigma plumbaginoides* or *Plumbago Larpentae*, as it was once named, is familiar to many English gardeners as a suitable plant for the embellishment of the rock garden during the late summer, when it is rendered attractive by reason of its prettily coloured foliage in addition to the beauty of its flowers. In certain favoured localities it is quite hardy, while in other districts it is necessary to give it the protection of a cold greenhouse during the winter months.

Here, in New York, I find it grown as a basket plant with splendid effect, and as I have not seen it treated in this manner in the old country, I thought it worthy of note.

PUBLIC PARKS AND GARDENS.

PENTSTEMONS IN LONDON.

IN the Victoria Tower Gardens, which stretch along the Thames Embankment, from the southern end of the Houses of Parliament, there is an exceptionally fine show of *Pentstemons*. An ample border, approaching a hundred yards in length and averaging nine feet in breadth, is filled with a large collection of the best varieties. These plants are very well grown and, as special care has evidently been taken in the colour arrangement, the border is particularly attractive.

Great interest is added by the neat stand which contains "A Short History of the *Pentstemon*" (see p. 122). From this the gardener, who desires to know the origin of the *Pentstemon*, may learn that while there are sixty species in cultivation, the handsome sorts now to be seen were obtained from *P. Cobaea* and *P. gentianoides*, two pale-purplish-coloured species from America. The latter, which is represented by a goodly batch of plants, is, in itself, a valuable garden plant and not surpassed in grace by any of the newer sorts. This account of the *Pentstemon* also states that we owe the *Pentstemon* as a garden plant to John Mitchell, an English physician who lived in Virginia in 1741.

As already stated, *P. gentianoides* is one of the most graceful of the *Pentstemons*, and it is the tallest of those to be seen in this noteworthy border. Its flowers are also the equal of the others in size; they are of pale purple, or lilac shade, with a pale throat. For general garden effect the varieties which have a definite white

THE compiler of this small volume* expresses the belief that it "will fill a vacant space in gardening literature." Earlier in the preface he suggests that the book is intended for the edification of amateurs and jobbing gardeners, its object being to provide "a complete and effective guide to garden plants of every description." Greatly daring, the compiler has attempted this within the limits of an octavo volume of 155 pages, including lists of plants for various purposes and seasons and with few apparent qualifications.

A few quotations, taken at random, will serve to show the style and the measure of success that has been attained. "Laurel—*See Aucuba, Kalmia*." "*Jasminum* (*Jasmine*)—Ord. *Oleaceae*. Hardy, greenhouse and stove shrubs. Like a good ordinary soil. Propagation by layering or by cuttings. The flowers are yellow or white. Some of the kinds are small, not growing higher than three or four feet. The more usual height varies between ten and twenty feet." "*Pelargonium* (*Stork's Bill*) Ord. *Geraniaceae*. Greenhouse and hardy perennials. Soil loam and leaf mould with a little sand preferable. Propagated by cuttings, which may be taken during the whole of the Spring and Summer, in sandy soil in boxes and pots. Increased by seed, buds, and also by cuttings of the roots, though these methods are less usually employed than the first. Colours various. Height six inches to three feet. Flowering period, April to July. There are several sections, including the variegated-leaved and the Ivy-leaved, as well as the Zonal."

There are numerous little pen-and-ink sketches concerning which the compiler wisely states on page nine: "The illustrations in the text refer to the plants whose names appear in capitals ABOVE the illustrations," for we failed to recognise quite a goodly proportion. However, the half-tone illustrations are good, but, and the inevitable "but" intrudes itself, these were supplied by, with one exception, only two firms "that readers may deal with . . . knowing they will receive value for their money." We have nothing but respect for the two firms in question but this savours too much like an advertisement.

As a dictionary of gardening this newcomer has the merit of being cheap and the publishers have done their part as well as could be expected, but we wish the material had been more worthy of their attention.

Gardening in Wales.

Most readers of *The Gardeners' Chronicle* are well acquainted with the interesting notes that are periodically written by Mr. A. T. Johnson on uncommon plants growing in North Wales. In amplification, as it were, he has

* *A New Dictionary of Gardening*. By J. W. Morton. Published by W. Foulsham and Co., Ltd., London. Price 2/- net.

titled quite a considerable book with pleasantly-written discussions on all manner of plants, and in the problems and pleasures connected therewith.

*A Garden in Wales** is essentially a book for the real lovers of gardens and gardening—the two are not necessarily synonymous—those who love to know of others' experiences with plants of their acquaintance, and of the plants they do not know; their garden trials, troubles and tribulations; their successes and failures. Mr. A. T. Johnson writes in an agreeable, conversational manner, and serves up frequent cultural hints in very attractive form. There does not seem to have been any set method with the book, which is made up of chapters with such titles as "Some Dwarf Woodland Plants, Mainly Ericaceous," "On Certain Early-flowering Shrubs," "Another Mixed Bag," and "On a Southern Slope."

In his preface, Mr. Johnson commences with the following rather surprising statement: "To most people a garden in Wales will doubtless be visualised as one with a climate of the kindest geniality, one that is watered by heaven's warmest and gentlest rains and sheltered from the biting winds of the east by the bulwarks of the hills. Comparatively, that may be true enough; actually it is a mirage." Now, I dare to say, to most of us Wales conjures up visions of a mountainous country with rushing streams and swept by fierce gales. So that to gardens in Wales the newcomer would probably expect to have to battle against adverse conditions and make his garden in what sheltered nooks he could find.

But, as so often happens, there is a considerable gap between these two impressions of the principality. Wales has rugged mountains and it is these very mountains that make the favoured valleys where, as Mr. Johnson has shown so delightfully, a great variety of uncommon shrubs and plants may be grown to the great joy of the possessor and the admiration and envy of the visitor. The letterpress is good, and there are about a score of very attractive half-tone illustrations. A. C. B.

REMARKS ON THE CONDITION OF THE FRUIT CROP.

(See Tables and Summaries, Ante. pp. 131-137)

SCOTLAND, N.

SUTHERLANDSHIRE.—Fruit generally is very scarce this year all over the north of Scotland. At Dunrobin there was a great show of blossom on all fruit trees, but late frosts and snow destroyed the flowers. Of Gooseberries and Black Currants we have none; Raspberries, only a very moderate crop, but Loganberries promise an abundant yield. Cherries were a super crop. Late Strawberry Alton Pine, promised fair, but all varieties of Plums, Apples and Pears are very scarce. The soil is of a light, sandy nature, with a subsoil of pure sand. W. F. Game, *Dunrobin Castle Gardens, Golspie.*

SCOTLAND, S.E.

ROXBURGHSHIRE.—The soil in this district is very light and of a gravelly nature. We have experienced a good deal of rain and very severe frosts; 18° of frost were registered on May 10, just when the blossoms of Cherries and Plums were fully expanded. On the whole, it has been a very backward season for fruit, and crops are nearly five weeks late. Alexander Black, *Ancrum House Gardens, Ancrum.*

SCOTLAND, E.

ABERDEENSHIRE.—Outdoor fruit crops are a failure owing to late frosts and the cold, wet spring and summer weather. Simon Campbell, *Fyvie Castle Gardens.*

—The fruit crops in this part of Scotland are, generally, disappointing. Early in the season all fruits promised to yield a good

average quantity. In April we had frost which, so far as records here are available, were unprecedented in severity, and they were followed by unusually low temperatures, with cold, biting winds. As a consequence of the untoward weather, with the exception of Strawberries, fruits of all kinds will be much below the average, both in regard to quantity and quality. John McKinnon, *Haddo House Gardens, Aberdeen.*

—The fruit crops, generally, are a failure, especially Apples and Currants. Strawberries were a fair crop, but very late and small. It is the most disastrous year for fruits in my fifty years' experience. James Grant, *Rothienorman Gardens.*

BANFFSHIRE.—The fruit blossom in this district was spoiled by frosts and cold winds from April 24 till May 1. We registered from 1° to 12° of frost, and again on May 23, 4°. Previous to this period trees and bushes were looking very well. George Edwards, *Ballindalloch Castle Gardens.*

FORFARSHIRE.—Fruit crops have turned out much better than was anticipated. Apples, Plums and Cherries were badly nipped by the late frosts, but Black and Red Currants came through remarkably well. Gooseberries carried as heavy a crop as we have ever had; Strawberries were good, although late. J. B. Peffers, *Panmure Gardens, Carnoustie.*

—The fruit crops are very much better than was expected after the severe frosts on April 29 and later. Previous to that date there was promise of the heaviest crop of fruit for several years. A considerable amount of damage was done to the Apple crop, which is practically a failure. Pear, Plum and Damson trees were laden with blossom, but these crops are only fair. Gooseberries, Black and Red Currants and Cherries cropped exceptionally well. Raspberries in sheltered gardens have cropped exceedingly well, but the foliage and young shoots of those under field cultivation were badly damaged by the frost. Strawberries were of good size but tasteless. Fruit, on the whole, is very late in ripening owing to an excess of rain and dull weather during May and June. Gavin Brown, *Craigo Gardens, by Montrose.*

KINCARDINESHIRE.—Owing to the long spell of dull, cold weather, all fruits are late. Strawberries look very promising, although the fruit may not be of good quality. In this district everything is about three weeks later than usual. William Thomson, *Ury House Gardens, Stonehaven.*

MIDLOTHIAN.—The fruit trees looked well in the early part of the season, but frosts completely ruined the blossoms. W. Crighton, *Morton Hall Gardens, Liberton.*

PERTHSHIRE.—The late frosts and cold winds spoiled most of the fruit crops in this district, the chief sufferers being Apples, Pears and Plums. Black and Red Currants suffered least. Our soil is of a heavy nature. James Tunstall, *Keir Gardens, Dunblane.*

—Up to April 27, the prospects of a heavy fruit crop were favourable, but hard frosts from then until the 30th severely damaged most fruits, especially Peaches, Pears and Apricots. These were well set and swelling freely, but dropped off later. Some varieties of Apples and Plums are bearing freely, while others are fruitless. Small fruits are a good average crop. Peaches are more affected by leaf-curl than usual, while the later Apple blossom never opened fully. James McGregor, *Rossie Priory Gardens, Inchture.*

SCOTLAND, W.

ARGYLSHIRE.—Fruit crops are very bad in this district owing chiefly to the severity of the weather in April and May. Bullfinches destroyed the buds on Plums, Currants, Gooseberries and Apples. Strawberries are losing vigour. Formerly they grew well, but runners from young stock are very weak. D. S. Melville, *Poltalloch Gardens, Kilmartin.*

AYRSHIRE.—This has been a disappointing fruit season. Everything promised well until April 28 and May 1, when 10° of frost were registered which made Plums and Pears fall from the trees. Apples were scarcely in flower, but later on they dropped their fruits, James Grieve, Worcester Pearmain and Allington Pippin being almost the only varieties with a few fruits. Peaches and Nectarines are much better as their fruits set before the dates mentioned and had four-ply netting to protect them. D. Buchanan, *Bargany Gardens, Dailly.*

—There was an abundant show of fruit blossom, but between 4° and 5° of frost at the end of April did great damage, and later cold winds about the middle of May resulted in Apples setting sparsely. The fairly heavy crops of last year may also have something to do with the light crop of 1927, but even trees that carried only a moderate crop last season are as bad, if not worse, than those which did well the previous season. Small fruits, with the exception of Strawberries, are very heavy crops, but they are later than usual in ripening, owing to the sunless, wet weather experienced during the latter half of June and continuing into July. A. T. Harrison, *Culzean Gardens, Maybole.*

BUTESHIRE.—Owing to the severe frosts in the last week of April and beginning of May, most fruits in this district are very scarce and late. Up to the time of writing the weather has been very wet and cold, consequently most fruits are quite a month late. Strawberries were very backward, and other fruits, such as early Gooseberries, show no sign of ripening. Our soil is heavy clay loam overlying marl rock. J. Davidson, *Arden Craig, Rothesay.*

DUMFRIESHIRE.—The fruit crops this year are the poorest on record owing to the late frosts. Everything pointed to a good crop until the advent of frost. Our soil is a sandy loam. James McDonald, *Dryfeholm Gardens, Lockerbie.*

STIRLINGSHIRE.—Apples when in bloom gave promise of a fine yield which, however, failed to materialise; the spell of wet weather which occurred at a critical time had much to do with the poor resulting crops. Plums, while in bloom, experienced 11°, 12° and 13° of frost on successive nights and, as was to be expected, the crop is almost a failure. The small fruit crops are the heaviest seen here for some years. Strawberries had a fine show of bloom, and the earlier varieties have developed well during a short spell of sunshine. At the time of writing some of the later varieties are still in bloom. J. D. Cunningham, *Duntreath Castle Gardens, Blanefield.*

ENGLAND, N.E.

DURHAM.—Taking into consideration the bad weather of summer and the severe mid-June frosts, it is rather a surprise that there is much fruit at all. Some varieties of Apples, such as Lord Grosvenor, Worcester Pearmain, Warner's King, Cellini, Stirling Castle and Ribston Pippin, have better crops than for some seasons past, and others are bare. Cherries are exceptionally good. Of the bush fruits, Currants and Gooseberries are heavily laden. Raspberries are good, but Strawberries are a failure. Plums are better than usual, but Pears, both on trained trees on walls and also on bushes are a miserable crop. J. A. Woods, *Beamish Park Gardens, Beamish, S.O.*

NORTHUMBERLAND.—All fruit trees promised good crops in early spring. Apricots set well but late frosts did much damage. Plums and Black Currants were cut down by the frost. Cherry trees have good crops, a few early flowers only being frozen. Apples and Pears set freely, but owing to weeks of dry weather and cold nights, the crop was reduced by half. Strawberries escaped the frost. Gooseberries set well but were blown off the trees during the last fortnight of June. Our trees have been very free from caterpillars; I destroyed the latter with Morteg, which has proved very satisfactory. The soil is a light loam of great depth, and rests on a bed of freestone. William McCombie, *Newton Hall Gardens, Stocksfield-on-Tyne.*

(To be continued).

FROST INJURY TO APPLES.

AMONG the different causes of disfigurement of Apples, before picking, it is probable that frost is by far the rarest, at least in so far as the south of England is concerned. It is, therefore, of interest in a year such as the present, when late spring frosts wrought considerable damage, to put on record the nature of the injury attributed to it.

The following figures, kindly supplied by Captain A. H. Bird, Observer at Wye under the Ministry's Agricultural Meteorological Scheme constitute a complete record of every occasion during the months of April and May, 1927, on which the temperature at Wye (Kent) fell below freezing point (32°F.).

| 1927. | Grass Minimum |
|----------------|---------------|
| Night of | Thermometer. |
| | °F. |
| April 1-2..... | 26 |
| 3-4..... | 28 |
| 7-8..... | 30 |
| 9-10..... | 31 |
| 11-12..... | 30 |
| 16-17..... | 29 |
| 17-18..... | 30 |
| 26-27..... | 21 |
| 27-28..... | 26 |
| 30-1 May..... | 21 |
| May 11-12..... | 25 |
| 13-14..... | 29 |
| 22-23..... | 30 |
| 27-28..... | 29 |
| 28-29..... | 29 |

It will be noticed that on the night of April 26-27 there was a hard frost, and that this was followed four nights later by another of equal severity. At this time (April 27) Bramley's Seedling Apple trees were in the early "pink bud" stage of blossoming, and the petals had not unfolded.

Some days after the two severe frosts had occurred it became evident that quantities of blossom had been damaged. In the case of earlier varieties with blossoms wide open, it is probable that great havoc was done, one plantation of Beauty of Bath, with a phenomenal amount of blossom—to the writer's own knowledge—being subsequently entirely without fruit. Varieties such as Bramley's Seedling, with the blossom not so far advanced, did not escape, and even in those blossom buds which were green, *i.e.*, with the petals still folded and covered by the calyx, the receptacle was found to have been turned brown in the centre. Before May was ended, therefore, it was not surprising that growers held a somewhat pessimistic view regarding the present year's Apple crop. It is probable that the greatest damage occurred in low-lying situations or in those which were much exposed. Orchards and plantations on higher ground or those which were well sheltered escaped injury.

An almost immediate effect of the frost was seen on the foliage of several varieties. Many leaves became puckered and blistered, the whole thickness of the lamina, with the exception of the lower epidermis, being raised here and there. The lower epidermis was unable to cover the bases of all the blisters on a leaf, and in many cases had become torn or had turned brown under the puckered places, giving the lower surface of the leaf a brown-green, mottled appearance in addition to the crinkling. The affected leaves were amongst the earliest formed, and they did not sustain sufficient injury to cause them to fall. Figure 68 shows two frost-affected leaves of Cox's Orange Pippin, which were photographed on July 8.

As regards the fruits, it was soon found that the damage done was considerably less than had been thought, and that a fair crop of Apples was setting. From early June onwards, it was noticed that Apples of several varieties, growing in various situations, were marked around the "eye" with a greyish-brown ring of dry skin, and in certain cases there were shallow cracks present in the affected zone. The injury was not deep and the layers of brown cells, if scraped with the finger nail, were easily removed, revealing the normal green colour of the Apple skin beneath. This damage was conspicuous

and will possibly reduce the market value of the fruit. In the majority of cases seen, the quantity of fruits affected on any one tree has been small, but a whole plantation of Bramley's Seedling is known to the writer in which practically every Apple on all the trees

Apples have quite possibly been derived from some of the more tightly-closed flower buds in the case of a variety such as Bramley's Seedling. These might have suffered no internal injury but might have been slightly frozen on the exterior immediately below the lobes of the calyx.

FIG. 67.—FROST INJURY TO APPLES.

Bramley's Seedling; natural size; photographed July 8, 1927.

is thus marked. The damaged fruits are at present hanging well, and there is every indication that they will reach maturity. Fig. 67 shows the injury to Bramley's Seedling Apples gathered from the plantation mentioned.

Similarly marked Apples have been received

Several forms of injury to Apples, including that under consideration, are figured by P. J. Fryer.* Frost damage to the fruit has also been described by U. P. Hedrick† in the United States.

As regards the frost-blistered foliage, this has been described by Paul Sorauer‡ in Germany

FIG. 68.—FROST INJURY TO APPLES.

Blistered leaves of Cox's Orange Pippin, photographed July 8, 1927.

from Swanley, East Malling, Patricxbourne, near Canterbury, and Linton, near Maidstone, in addition to those which are common at Wye. It is known that besides Bramley's Seedling, Stirling Castle is another variety which suffered injury to the fruit.

There seems no reason to doubt that frost was the cause of the damage, since this type of injury cannot be attributed to animal or fungous agency; further, it has occurred plentifully on trees which have never been sprayed and on trees the blossom of which is definitely known to have been damaged by frost. Externally disfigured

and by F. C. Stewart and H. J. Eustace§ in the United States. In England the phenomenon fortunately appears to be rare. W. M. Ware, South-Eastern Agricultural College, Wye, Kent.

MARKET FRUIT GARDEN.

THE present season, so far as my place is concerned, promises to be satisfactory, though, so far, it has been very difficult. The satisfaction comes from bountiful crops of Black Currants, Apples, and two varieties of Plums; the difficulty has been caused by the weather, which has hindered cultivation and frequently interrupted picking. I am generally able to pride myself on the cleanliness of my cultivated plantations, but this year they are disgracefully weedy. A wet March prevented an early start with cultivation. During most of the time when the land was fairly dry in April horses and men were fully occupied with spraying, so little cultivation was accomplished. Then came the May drought, which hardened the surface so that implements could make little impression. The return to rainy weather in June and July produced a big crop of weeds and poor conditions for dealing with them. From now onwards the horses will be almost continually employed in carting Apples from the plantations to the packing house and again to the station; so it is to be feared that the land will have to remain weedy, unless a team can be hired.

As for picking, I never remember such a difficult time during the Black Currant harvest. On account of rain and dewy mornings, scarcely a full day's work was accomplished; and matters have not been much better during the picking of Rivers' Early Prolific Plums. Turning to the more cheerful side of the picture, there is ample compensation to be found in the excellence of certain crops. Black Currants, to my surprise, yielded more than double as much as they did last year—the best crop I have had for a long time. Rivers' Early Prolific Plums produced nearly three times the amount of last season's crop, a number of trees having to be propped up to support the weight. Czar, unfortunately, was not propped, and a good many branches have broken under the load of fruit. Other varieties of Plums will give so light a crop as to be scarcely worth mention. A mere sprinkling of Victoria, Pond's Seedling and President is all that the spring frosts have left. The brightest feature, however, is the Apple crop, which, for quantity and quality combined, is the best I have had since 1922. As the crop throughout the country is decidedly patchy, there should be a fair prospect of marketing the fruit to advantage.

BLACK CURRANTS.

Black Currants have apparently been planted too extensively in recent years. It seems impossible otherwise to account for the very low prices realised for this season's crop. Taking the country as a whole, the yield was certainly not more than moderate. East Norfolk, the chief Black Currant area, was even less fortunate. Yet the price fell to 4d. per lb. in Covent Garden. Only those growers who made forward contracts secured a satisfactory return. I refused a late contract at 6d. per lb.; but it would have paid me to accept it for several tons of mid-season fruit. If I had not been lucky enough to obtain a heavy yield, the result would have been very poor. The question is: What will happen in a season when there is a really good crop throughout the country? Apparently it will depend a good deal on continental supplies. This year imports from France were exceptionally heavy; and the quality of the fruit was so good that many jam-makers bought it in preference to home-grown. The outlook is not encouraging. I doubt if we can afford to grow Black Currants to sell at less than 6d. per lb., for they are an expensive crop. Generous manuring is essential, and bud-mite, aphid and reversion are costly to control. Certainly there will be no profit made from plantations which are not in thoroughly healthy and productive condition. Those which are worn out, or which contain many reverted bushes, should be grubbed; and it may be that by doing this growers will ease the situation to some extent.

Mine being an early district, it will probably pay me best to grow Boskoop Giant and to place

the crop on the market in the ordinary way. I obtained 11d. per lb. for some fruit of this variety. Baldwin was weighted down and black with fruit, but, as the bushes are young and small, they did not yield so heavily per acre as Seabrook's Black. I doubt if Baldwin will answer with me, as it will not hang late enough in my early district to escape the low, mid-season prices, and it is not vigorous enough for my soil. Owing to the heavy crop and the drought, it has made scarcely any growth this year, whilst other varieties have done very well in this respect. Bushes of several varieties planted last winter looked rather sickly during the drought, but have since made such good progress that they will be large enough to carry a substantial crop next year.

A CLEAN APPLE CROP.

My worst enemy, Apple scab, is giving me hardly any trouble this season. There is ample evidence that spraying was worth while; but there is no doubt that the dry weather of May also played an important part in holding the disease in check. I was afraid that the frequent rains experienced since then would result in a serious spread of scab, but, as my past records show, it is the weather of May which has most to do with the amount of trouble from this disease. Conditions before and after are relatively unimportant. That it is most unwise, however, to trust to the controlling influence of drought is shown by unsprayed trees on my place and by reports from other districts, where scab has severely attacked the fruit on trees not protected by fungicides. The least satisfactory control with me is in the case of Beauty of Bath; but even this variety carries a much higher percentage of clean fruits than it has done for several years.

Some months ago, a correspondent to this journal recorded his experience that trees growing in positions where they are shaded during part of the day are much freer from scab than trees in fully exposed positions. It has been easy for me to put this matter to the test, as control rows, purposely left unsprayed, in one plantation, are protected from the morning sun at one end by a high shelter belt. Careful examination does not afford any confirmation of the theory. There is some variation in the amount of scab on different trees in the rows, but it has no reference to their position with regard to shade. It is more likely due to variation in stock, as the trees are on seedling stocks. The shaded trees are neither better nor worse than the fully exposed ones with respect to scab.

TROUBLE WITH LOGANBERRIES.

Loganberries are apparently liable to suffer from a disease somewhat similar in its characteristics to reversion in Black Currants. A relative and near neighbour planted some Loganberries in the winter of 1925, and they carried their first crop this summer. He finds that a considerable proportion of the stools is worthless, the leaves being small and narrow and the fruits imperfect. The cause of the trouble has not yet been definitely traced.

THINNING APPLES.

The thinning of some of my latest varieties of Apples has not yet been finished. The weather interrupted and prolonged the picking of soft fruits to such an extent that there was no interval between this and the picking of early Plums during which the women could attend to thinning. Most of the work has been done by men working overtime—a rather too expensive method. Early varieties were, for the most part, dealt with in good time, although the start was postponed owing to the rather heavy natural dropping of fruit, which seemed likely to thin the crop sufficiently. The value of early thinning is now strikingly apparent. Lord Grosvenor and Early Victoria, for example, have responded wonderfully, the fruit being large and even in size. There can be no doubt whatever that thinning is a sound commercial proposition in these days when the public demand high-grade fruit. Cooking Apples of small size are almost worthless. *Market Grower.*

FRUIT REGISTER.

APPLE COE'S GOLDEN DROP.

It is a matter for considerable surprise that this really excellent Apple is not more freely planted. Within my knowledge, a fine crop of clean fruits was invariably gathered from a standard tree and always claimed a full measure of appreciation. In season from November to May, the fruits are small to medium in size, conical, very even and regular; the skin yellow, flushed crimson on the cheek facing the sun, with a few irregular, crimson spots, and flushed with thin patches of delicate russet. The flesh is greenish-yellow, firm, very juicy and sugary; the tree is hardy and a regular cropper.

Mr. Gervase Coe, of Bury St. Edmunds, who raised the Golden Drop Plum, was also responsible for the introduction of this useful dessert Apple. Whether he raised it is a matter of some doubt, as Dr. Hogg states that the variety was probably known in Essex orchards for many years prior to its introduction, although it was sent out by Coe as a seedling. Coe's Golden Drop is also an excellent Apple on the Paradise stock, either as a dwarf bush or espalier. *Ralph E. Arnold.*

APPLE COURT PENDU PLAT.

This very old Apple is one of the most consistent cropping varieties, but, as stated in your remarks on the fruit crops (p. 121), it has failed entirely in many districts this season. A tree in my garden has cropped consistently over a long number of years, but it has only one or two fruits this season. It is one of the latest of all Apples to flower, and in the majority of years it escapes injury to its blossoms, for which reason it has long been known as the "Wise Apple." Other synonyms are Garnons and Wollaton Pippin. This variety is grown extensively on the continent, and Hogg, in the *Fruit Manual*, gives a whole list of names in French and German.

The fruits are of very characteristic shape, so that the variety is easily determined. They are oblate, of regular outline, and flattish at the top and bottom, something after the manner of Fearn's Pippin. The flavour is good, but the flesh is very hard, and on that account is not popular with some. When, however, at their best, the fruits are very crisp, juicy and finely flavoured. In sunny summers the skin develops a rich red tinge on the exposed side. The variety is well worth cultivating, as it is one of the most dependable of all Apples in cropping. *T.*

HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

R.H.S. Awards.—The criticism by so faithful a servant of horticulture as Mr. Charles E. Pearson, in your issue of August 6, will naturally command attention. If Mr. Pearson will be good enough to look on page 67 of the R.H.S. *Notices and Arrangements* for the year 1927, he will see the objects of the Committees set out; these include awards to "objects of great excellence which have been hitherto overlooked or ignored"; accordingly, Floral Committee B were acting up to their instructions in making the awards to which Mr. Pearson takes exception. It remains to consider these awards on their merits, and in this connection it may be pointed out that whilst shrubs from South America, Australia and New Zealand are often tender while young, they become reasonably hardy when they have made plenty of wood and attained the proportions of a bush. *Carmichaelia australis*, as generally seen, is a rather weedy shrub and not very attractive. As shown by Mr. Gerald Loder it was a charming plant; owing to the wet weather it had developed a number of small leaves, and these set off the innumerable white and purple

flowers, giving the general impression of a very beautiful Heath. Feijoa Sellowiana flowers well on walls in many parts of England, including Kew, when the wood is mature. It is very beautiful in flower but rarely or never fruits in this country. Major Stern has recently planted the Feijoa in his chalk pit, and I have followed his example and put a plant on the open down at the foot of Boxhill. It survived the frosts of 1925-6, and though early this spring it had its head blown off, it is growing very well. *Lomatia ferruginea* has been flowering freely this year throughout the country and has revealed an unsuspected charm, having been grown up to now mainly for its foliage. It succeeds well in the open at Headley without the support of a wall, and Mr. H. Comber has recently brought back from the Andes seeds collected at a high altitude. *Mitraria coccinea* is a charming plant which does best in peaty soil on a north wall. We grow the tropical *Hymenocallis speciosa* bulb in complete shade under the staging in the stove, but it will also grow in a temperate house. It increases rapidly by offsets and is no trouble whatever, producing magnificent leaves throughout the year and immense umbels, two feet across, of white flowers, on stalks three feet high. Each bulb flowers regularly in July or August and scents the air with the heavy fragrance of Vanilla. For some reason or other, this bulb figures at a high price in catalogues, but there seems to be no justification for this as it is very easy of increase. We owe a debt of gratitude to Mr. Hay for reintroducing the beautiful annual *Sabbatia campestris*, indeed, it is difficult sufficiently to appreciate the work Mr. Hay has done and is doing in recovering fine plants that have gone out of cultivation; for example, certain *Arctotis* and other *Compositae*, *Lathyrus nervosus*, *Berberis Nevinii*, and the blue perennial *Triptilion*. Five of the six plants mentioned above may be obtained without much difficulty in this country and would well repay any Fellow who might acquire them. They were originally introduced to this country by old collectors who were able to pick and choose their plants and did not have to go through a flora with a tooth-comb, which nowadays results in a crop of dingy Primroses, weedy *Calceolarias* and minute *Rhododendrons*! Finally, further justification for the awards made to these plants is found in the fact that within the last ten years four of them have been considered sufficiently worthy to have their pictures in *The Gardeners' Chronicle*. William Lawrence, Burford.

Strawberries.—I think the majority of gardeners find Strawberries a difficult crop to grow. One hears much about failures by private gardeners, but these are not the only places where there is trouble. I have seen acres of Strawberry plants ploughed in (and other crops planted) by market growers. Those who have trouble with British-raised varieties might do worse than try the Dutch and German sorts. I know gardeners who have tried them and secured good crops, and if the fruits are not quite up to those of British Queen flavour, it is better to obtain a good, healthy crop than the miserable specimens one sees so often everywhere. I planted The Duke, and two years afterwards grubbed the lot out, then planted two other new introductions which were also grubbed up. Royal Sovereign, from new stock, bought in pots, was a failure. Kentish Favourite did well, but Leader was the worst of the lot with me. Madame Kooi (a monstrosity) stood up as green as grass when the other varieties were dead or dying. What is the reason of it all? It cannot be that cultivation is at fault, as Strawberries fail under the best of conditions. Sometimes one sees a healthy lot. I saw such a batch grown under market conditions planted with dibbers, and cropping well, while less than a mile away young beds were being ploughed in, although the ground had been well prepared. Would it not be advantageous if our Strawberry raisers used some of the foreign-raised sorts as parents to impart new vigour into their stock? Perhaps they have done so. Strawberry growing is not a paying proposition now, so far as British-raised varieties are concerned. G. Kent, Apps Court Nursery, Waltham.

SOCIETIES.

SCOTTISH SWEET PEA, ROSE AND CARNATION.

SUCCESS again attended the annual show of this enterprising Society, which was held on Wednesday and Thursday of last week. The entries in the large classes of Sweet Peas were not so well filled as in former years, but the popularity of the single vase competition was reflected in the increased space required. Roses were particularly good, and the entries were the largest in the history of the Society, while the quality of the blooms was almost incredible considering the weather. The backward season did not affect either the quantity or quality of Carnations.

SWEET PEAS.

In the open section, Messrs. TORRANCE AND HOPKINS staged the only collection, and they were second in the class for twenty-four vases, where Mr. JOHN A. GRIGOR won first prize; he also excelled with a decorative vase of six novelties of 1927. The latter consisted of Model, What Joy, Royal Mauve, Del Monte, Red Gauntlet and Patience. Two Cumnock growers, Mr. JAMES BLACKWOOD and Mr. DAVID SMITH, were first and second prize winners in the class for twelve vases, the first-named showing Ivory Picture, Sybil Henshaw, Youth, Charming and Powerscourt.

Honours in the gardeners' section were widely distributed. Mrs. Claud Allan's Cup for six vases was awarded to Mr. J. B. CAMPBELL, Newport, whose examples of Margaret, Peggy, Purple Perfection, Powerscourt, Constance Hinton and George Shawyer were superior, but their arrangement could have been improved. Mr. ROBERT MILLAR, Dumbarton, excelled for twelve vases; and Mr. JOHN M. URQUHART, for nine vases. Mr. EDWARD THOMSON, Larbet, was also successful.

The principal prize winners in the amateurs' section were Mr. JAMES PAUL, Killcarn; Mr. WALTER TURNER, Chryston; Mr. JAMES LOGAN, Cumnock; Mr. JAMES MCINTOSH, Aberdeen; and Mr. JOHN M. JEFFREY, Selkirk.

The last-named exhibitor also excelled in the gardeners' and amateurs' sections, and he staged the best vase of the new cream sort, What Joy. Prize winners of single vase classes were Mr. J. GRIGOR (Royal Mauve and Miss Philadelphia); Mr. JAMES PAUL (Colorado and Olympia); and Mr. J. LOAN, Coldstream, (Model). This vase of Mr. Bolton's new white Pea also secured the award for the best vase of any 1926-7 novelty, and was ultimately selected as the best vase of Sweet Peas in the show.

The chief award in the open class was the Burpee Cup, for which there were nine groups of twelve vases. Competition was keen, and Mr. JAMES PAUL defeated Mr. J. A. GRIGOR (second prize) and JAMES LOGAN (third prize). His best vases were Magnet, Royal Sovereign, Charming, Venus, Hebe, Youth and George Shawyer. Mr. GRIGOR was compensated by his success in the class for eighteen vases, for which Mr. JAMES BLACKWOOD was the runner up, and he also won six prizes in the single vase competition.

ROSES.

The feature in this section was the outstanding success of Messrs. D. AND W. CROLL, Dundee, who were placed first for six baskets, twelve vases, twelve blooms of varieties introduced since 1924, twelve blooms red, twelve blooms yellow, twelve blooms of any other colour, and twenty-four blooms, distinct varieties. Messrs. JAMES FAIRLEY AND Co. and Messrs. ADAM AND CRAIGMILE were also successful. Only Mabel Morse was shown in the yellow class and Mrs. Henry Bowles in the pink class, but the most admired exhibit in the show was Messrs. CROLL's dozen blooms of Lady Inchiquin. In the class for six blooms of any seedling not in commerce, Messrs. DOBBIE AND Co. were placed first and second with Duchess of Atholl and Elizabeth of York, for which they also

received a Gold Medal and Certificate of Merit, respectively.

Among the successful exhibitors in the Gardeners' and Amateurs' classes were Mr. EDWARD PENFOLD, Parton, Mr. JAMES KERR, Stewarton, Mr. ANDREW FOX, Kilverning; Mr. J. G. WILLIAMSON, Whitecraigs, Mr. D. MURCHESON, Kirn; and Mr. JAMES PATERSON, Lamington; the last-named won Lady Glenarthers Cup in the amateur class. The best Rose in the nurserymen's class was Mrs. Franklin Dennison, grown by Messrs. PATON AND SONS, while in the gardeners' and amateurs' section, Mr. JAMES KERR provided the best bloom with an example of Mrs. Henry Bowles. Mr. JAMES PATERSON secured a similar honour in the amateur division.

CARNATIONS.

Here a new successful record was created by Mr. ALEXANDER McMILLAN, Cumnock, who staged eleven first prize exhibits, his prizes including the Irvine Valley Cup for six vases of Carnations and Picotees; the Carlaw Cup, open to gardeners and amateurs; and a Gold Medal for the best vase of Carnations shown by an amateur. In the remaining classes Messrs. JAMES SMITH, Darvel; Mr. THOMAS KILPATRICK, Kilmarnock; Mr. JOHN H. McDONALD, Glasgow; Mr. R. W. MAIR, Stewarton; and Mr. JAMES FULLARTON, Ayr, also excelled. All the first prizes for Perpetual-flowering Carnations were won by Mr. ARTHUR ROSS, Kilmalcolm, and in each case Mr. A. T. HARRISON, Culzean Castle, was the runner up.

DECORATIVE.

The display in this department was extensive and of high merit. The Invertrossachs Cup for the best decorated dinner table was awarded to Miss EDNA DIXON, Dumfries, whose arrangement consisted of *Lamia* Roses.

Mr. D. McNEIL and Mr. W. HOLMES, Helensburgh, staged the best bouquets, while Mr. JAMES BLACKWOOD, Mrs. RUSSELL MEARNES, Mr. E. PENFOLD, Mr. ARTHUR ROSS and Miss SMILLIE were other prize winners.

TRADE EXHIBITS.

Large Gold Medal.—To Messrs. AUSTIN AND MCASLAN, Glasgow (Roses); and Messrs. DOBBIE AND Co., Edinburgh (Roses and Sweet Peas).

Gold Medals.—To Messrs. THYNE AND SON, Dundee (Roses and herbaceous flowers); Messrs. R. K. GEMMELL AND Co., Glasgow (Roses and Sweet Peas); and the SCOTTISH CO-OPERATIVE WHOLESALE SOCIETY, West Killside (Roses).

Silver Medals.—To Messrs. LOWE AND GIBSON, Crawley (Carnations); to Messrs. LEIGHTON'S, Glasgow (Sweet Peas); to Messrs. BALLANTYNE AND JACKSON, Hamilton (Sweet Peas and Roses); and to Messrs. CAMPBELL AND SON, High Blantyre (Carnations).

SWEET PEA TRIAL AWARDS.

Specimen vases of seedling Sweet Peas which have been under observation at Helmsburgh, were staged by the Society and the following awards were made:—

Gold Medal.—To Mrs. A. Searles (Messrs. ROBERT BOLTON AND SONS). This cerise variety showed a rogue at the Reading trials, but came true in the Scottish trials of the past two years.

Silver Medal.—To *Pinkie*, deep cream-pink (Messrs. C. MORSE AND Co., California); *St. Mungo*, deep cream pink (Mr. GEORGE BOWNESS, Busby); and *Charm*, deep cerise (Mr. J. STEVENSON, Wimborne).

Certificate of Merit.—To *Glorious*, cerise; and *No. 68*, rose (Mr. J. STEVENSON); *Hero*, cerise (Messrs. C. C. MORSE AND Co.); *Auld Reekie*, light cream-pink (Mr. BOWNESS); *Mountjoy*, cerise (Mr. W. E. SANDS, Lisburn); *No. 35*, cream-pink (Messrs. R. BOLTON AND SONS); *No. 86*, blue (Messrs. DOBBIE AND Co.); *Victoria*, lavender (Mr. W. J. BLAND, Victoria, B.C.); *Corona*, rose, and *The Admiral* (Messrs. CULLEN AND SONS, Witham); the last is a new shade in dark blue Sweet Peas, and the blooms are large and of good form.

ROYAL HORTICULTURAL.

AUGUST 16.—There was a rather better attendance at this fortnightly meeting of the Society at Vincent Square, Westminster, than on several recent occasions. Gladioli were the chief flowers, though Roses, Phloxes and general border flowers were freely shown. The Foremarke Cup for Gladioli induced good competition. The Floral Committee recommended three Awards of Merit and selected four other novelties for trial at Wisley. Orchids were few and apart from several small collections of bush fruits the Fruit and Vegetable Committee found little to engage its attention. The Joint Dahlia Committee met for the first time this season and selected seven new Dahlias for trial at Wisley.

Orchid Committee.

Present: Mr. C. J. Lucas (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. Frederick J. Hanbury, Mr. Arthur Dye, Mr. J. E. Shill, Mr. H. G. Alexander, Mr. Fred. K. Sander, Mr. Charles H. Curtis, Mr. A. McBean, Mr. T. Armstrong and Mr. Richard G. Thwaites.

AWARDS OF MERIT.

Cypripedium Hiraethlyn (Godefroyae × Blanchette).—A very charming hybrid with petals and dorsal sepal quite broad, white, with radiating, dotted markings of dark purple, while the white lip is "dusted" with dots of similar colour. Shown by LADY ABERCONWAY and the Hon. H. D. McLAREN (gr. Mr. Puddle), Bodnant.

Odontoglossum grande var. *Oddity*.—A very distinct and unusual form in which both the petals have taken on the formation of the labelum so that the flower appears to have three lips; there is but one column, but the winged base and crest of the lip is repeated in the petals. The sepals have darker brown markings than in most forms of *O. grande*, and the yellow ground colour in all the parts is paler than usual, the true lip being the only organ of quite similar colouring to the type. Shown by Messrs. STUART LOW AND CO.

GROUPS.

Messrs. SANDERS contributed a group of Orchids, and their exhibit contained a fine specimen of *Oncidium Wentworthianum* with a branching spike about eight feet long, carrying yellow and brown flowers; examples of *Stanhopea oculata* and *S. insignis* var. *flava*, the latter carrying eight flowers, with a second spike as yet unexpanded; *Vanda coerulea*, *Oncidium pumilum*, *Bifrenaria tetragona*—quite rare; and *Odontoglossum grande* and its variety *Oddity*, which is described above. Other interesting plants were *Cypripedium niveum*, *C. A. de Laresse* var. *St. Alban*, *C. Wiertzianum* and *C. Maudiae*, together with *Cattleya triumphans*—one of the *C. Rex* hybrids—*C. Hardyana* and *C. H. alba*.

Messrs. CHARLESWORTH AND CO. showed the fine *Laelio-Cattleya Pyramus* var. *Senator*, with handsome, mauve-purple flowers; *L.-C. Orebus*, with golden sepals and petals; *Odontioda Vivian*, *Odontoglossum Olivia* var. *Princess*, *O. Harryanum magnificum*, *O. St. Mungo*, quaintly marked; *Vuylskeara rubra*, *Platyclinis filiformis*, and the tiny *Masdevallia simula*.

LADY ABERCONWAY and the Hon. H. D. McLAREN (gr. Mr. Puddle), Bodnant, showed *Cypripedium Hiraethlyn* (Godefroyae × Blanchette), *C. Glaslyn* (Blanchette × niveum), and *C. Penllyn* (bellatulum × Blanchette). These were all new crosses and all very beautiful; we have placed them in the order in which they appealed to us. *C. Hiraethlyn* has broad, white segments dotted and dusted with dark purple; the lip is white, faintly dotted or dusted with purple, and has a small opening.

Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mrs. Ethel M. Wightman, Mr. H. J. Jones, Mr. William Howe, Mr. Donald Allan, Mr. D. Ingamells, Mr. W. H. Page, Mr. James B. Riding, Mr. W. B. Gingell, Mr. J. T. West, Mr. D. B. Crane, Mr. Courtney

Page, Mr. G. W. Leak, Mr. A. Turner, Mr. Charles E. Pearson, and Mr. N. K. Gould, Secretary.

Section B.—Hon. Henry D. McLaren (in the chair), Mr. James Hudson, Mr. G. Reuthe, Mr. F. G. Preston, Mr. Mark Fenwick, Mr. Amos Perry, Mr. E. H. Wilding, Mr. G. Yeld, Mr. T. Hay, Mr. W. G. Baker and Mr. R. D. Trotter.

AWARDS OF MERIT.

Lobelia Shirley Crimson.—This is a very showy variety of the tall-growing *L. cardinalis* type. It is a vigorous grower producing large, purplish leaves and an erect raceme of large, bright crimson flowers. Shown by Messrs. B. LADHAMS, LTD.

Rhododendron prophantum.—Unfortunately, it seems that this vividly beautiful *Rhododendron* is not quite hardy. It was discovered by Forrest in Upper Burma in 1919, where it becomes a large tree. The large leaves are rough, dark green and covered on the upper surface with a loose, dark grey tomentum, while the undersides have a persistent pale cinnamon covering. The trusses are large and the semi-pendulous flowers have long, hairy stalks. The colour is a shining Morocco crimson. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Southampton.

Watsonia Orange Beauty.—This is a vigorous variety of the well-known South African Liliaceous plant, bearing pale orange-coloured flowers. Shown by LADY ABERCONWAY (gr. Mr. F. C. Puddle), Bodnant, N. Wales.

FOR TRIAL AT WISLEY.

Three very good, large-flowered Gladioli, raised by Messrs. KELWAY AND SON were selected for trial at Wisley. Langport Scarlet is of brilliant scarlet colour with a touch of crimson on the lower segments. Perfect Peace has a well-formed spike of large, white flowers with short, dull to carmine lines running to the base of the segments. Mr. Peel has pink flowers with carmine markings on the lower segments. Phlox Sweetheart, sent by Messrs. RICH AND COOLING, bears a well-formed truss of large, pale pink flowers flushed with salmon, and has a paler centre.

DAHLIAS FOR TRIAL.

The following varieties were selected by the Joint Dahlia Committee for trial at Wisley.

Mrs. A. Sandeman.—A large, rose-mauve-coloured garden Cactus variety.

Mrs. Fred Warner.—A Cactus variety which has rolled florets of rose-pink colour lightly tipped with white. The centres of the flowers are milk-white.

R. H. Holton.—A very large, flattish Decorative variety of orange-scarlet colour.

Dulcet.—A Cactus Dahlia with rolled pink florets and a yellow centre.

Redpole.—A showy Cactus variety of velvety crimson colour.

Alfred Dyer.—A good, pure white Decorative variety. The above were shown by Messrs. J. STREDWICK AND SON.

Pink Perfection.—A pretty miniature Paeony of bright pink colour with a small carmine zone. Shown by Messrs. J. CHEAL AND SONS.

GROUPS.

Gladioli were extensively shown by many growers. Messrs. KELWAY AND SON filled a large space with a more than usually attractively arranged collection. In the centre they had a raised basket of the beautiful creamy Lady R. Portal, in association with Diplomacy, blush; Bleriot, bright salmon; J. L. Clucas, vivid scarlet, and the lovely Golden Measure. Amongst the many varieties shown in smaller quantity were the gorgeous Orby, of uncommon rose and velvety-crimson shades, and Princess Maud, of rich velvety-crimson colouring. In addition to the above-named large-flowered sorts there were many Primulinus hybrids.

In a large floor group, Messrs. CARTER AND CO. made a most attractive show of Gladioli. The centre was devoted to three large baskets

of the clear purple Jacoba, with lower baskets of the dark velvety Baron Hulot. Other admirable sorts were Rose Precocoe, of salmon colouring; Vesuvius, fiery red; White Giant; America, lilac blush; and Niagara, of creamy shading. Besides these large-flowered varieties there was a good selection of Primulinus hybrids.

On the staging, Messrs. R. H. BATH, LTD., set up an interesting collection of Gladioli of both types. Chief amongst the Primulinus hybrids were goodly vases of Salmonea, Salmon Beauty, Alice Tiplady, L'Orillon and Xanthia. Messrs. D. STEWART AND SON had vases of Frau Dr. Hauff, orange-crimson, and Dawn, salmon, of the large-flowered sorts, and Atalanta, Souvenir and Isis amongst the Primulinus hybrids. Messrs. KONIJMENBERG AND MARK had a good collection of Gladioli. Messrs. R. AND G. CUTHBERT staged Glory, Orange Queen, Orange Brilliant, Vanessa, Margaretta and other Primulinus varieties with a background of *Hydrangea paniculata grandiflora*.

The Foremarke Cup, which is offered for a collection of twenty spikes of Gladioli, in not fewer than ten varieties, grown by the exhibitor, was won by Mr. A. E. AMOS, Colchester, with an exceedingly good collection. His chief varieties were Leslie Henson, pink with a cream blotch Sunset, shades of salmon; and Professor Ribbins, scarlet, of the large-flowered type, and La Couronne, white, with crimson markings on the lower segments; and Desmond Amos, lilac shades, with carmine blotch. Messrs. D. STEWART AND SON were second, and they included Libesfleur, Duchess of York, Pfitzer's Triumph, Herada and Sappho. Messrs. H. LANGRIDGE AND CO., the third prize winners, included spikes of Pride of Haarlem and Niagara in their exhibit.

On a goodly floor space, Mr. H. J. JONES set up an admirable collection of herbaceous Phlox, well set out in round baskets. His principal varieties were Evangeline, salmon; Dr. Koningshofer, glowing scarlet; F. A. Buckner, white; Europe, pale blush with carmine eye; Salmon Queen, and the splendid pink variety, Daily Sketch, which received an Award of Merit at the previous meeting. At one end of the Phloxes, Mr. JONES placed some baskets of decorative Dahlias.

Zinnias of exceptional size and of beautiful colours were staged by Messrs. DOBBIE AND CO. The many varieties included Crimson Monarch, Illuminator, beautiful old rose colour; Oriole, orange; Golden State, rich yellow; Dream, rosy mauve, and Purple Prince. An extensive collection of *Echinacea purpurea* was shown by Mr. ERNEST BALLARD. Mr. H. HEMSLEY had another selection of his dwarf Sidalceas, which included Mrs. J. B. Riding, double flowers of deep pink colour; Abol, clear pink; Mrs. R. Corfield, ruby red and some good unnamed seedlings.

In a large collection of miscellaneous border flowers, Messrs. B. LADHAMS, LTD., included hardy Crinums, Lavatera Olbia, Coreopsis, herbaceous Phlox, Sidalceas and Physostegia speciosa rosea. Mr. W. WELLS, Junr., brought a large quantity of Gypsophila Bristol Fairy which well illustrated its great decorative value. Nearby, Messrs. I. HOUSE AND SON set up a collection of their valuable varieties of Scabiosa caucasica.

By the Tea Annexe, Messrs. L. R. RUSSELL, LTD., had an interesting group chiefly of shrubs. This included Datura (Brugmansia) Knightii, bearing several large, pendulous double white flowers, Musa japonica (M. Basjoo), Hedychium Gardnerianum, Solanum jasminoides and some Clematis. Messrs. C. ENGELMANN, LTD., had a good collection of greenhouse Carnations, which included Orange Sunstar, Topsy, Eldorado and Saffron.

Roses were particularly well-shown. Messrs. ALEX. DICKSON AND SONS had large masses of Lady Worthington Evans, Margaret Dickson Hamill, Lady Mary Elizabeth, Betty Uprichard and Lady Hillingdon. Mr. J. H. PEMBERTON staged vases of Golden Emblem, Los Angeles, The Adjutant, Paul's Scarlet Climber and other good garden Roses. Messrs. B. R. CANT AND SONS included Red Letter Day, K. of K., Betty Urichard and Sovereign in their collection, while Messrs. RICH AND COOLING had a few vases of Roses with herbaceous Phlox.

Fruit and Vegetable Committee.

Present: Mr. E. A. Bunyard (in the chair), Mr. W. H. Divers, Mr. H. Markham, Mr. F. Jordan, Mr. J. Wilson, Mr. T. Pateman, Mr. G. F. Tinley, Mr. E. Harriess, Mr. H. S. Rivers, Mr. A. Bullock and Mr. A. N. Rawes (Secretary).

Mr. T. PATEMAN, Bocket Hall Gardens, Hatfield, exhibited Black Currant Florence, which received an Award of Merit on July 22, 1924. This variety was found growing in a hedgerow at Biggleswade some forty years ago. It is a very fine late Black Currant of exceptionally good flavour, and the fruits will hang until September. The Award of Merit previously granted was confirmed.

Mr. E. A. BUNYARD showed fruits of the Mirabelle Plum and Cambridge Gage; the latter is a very heavy cropping variety, and grown largely for market in the Cambridge district. It is partly self-fertile and a very useful variety for pollinating other Plums.

Messrs. DANIELS BROS., LTD., Norwich, showed this Black Currant September Black; Messrs. LAXTON BROS. showed the Veitchberry, and Mr. J. J. KETTLE a group of Raspberries and Wineberries.

SHROPSHIRE HORTICULTURAL.

MANY circumstances combined to make the opening day of the Shrewsbury Floral Fete an unusual success. The show was held on August 17 and 18. August 16 was a very wet day in the west and midlands, and rain fell incessantly during the morning at Shrewsbury, but the afternoon was pleasant and the evening gave promise of a fine day to come. This promise was fulfilled, and the opening day was bright and fine—Queen's weather—to greet Her Majesty, who, accompanied by the Duke of Cambridge, visited the show about 10 a.m., and visited most of the tents and remained an interested visitor for a considerable time. In addition to the fine weather and the presence of Queen Mary, there was the success of the show from a purely horticultural standpoint; indeed, this was one of the finest shows held at the old-fashioned county town of Shropshire, whose streets run "up hill and down," and where half-timbered houses are numerous and historic associations abundant.

Non-competitive displays were particularly fine and constituted a considerable part of the show; they were as varied as they were interesting and beautiful. In competitive classes the array of large groups was imposing, while the contributions of Roses, hardy flowers, Gladioli, Dahlias and floral designs were all splendid; fruits were better than usual and vegetables quite up to the usual high standard expected at Shrewsbury.

Judging commenced at 9 a.m., and the public were admitted at 10.30 a.m.; by 11 a.m. the tents were crowded and note-taking was an extremely difficult business.

GROUPS AND PLANTS.

There were four competitors for the Shrewsbury Cup and £45 offered as first prize for an artistic display of flowering and foliage plants arranged on a space of 300 square feet, and these awards were secured once again by Messrs. JAS. CYPHER AND SONS with a particularly graceful, elegant and bright display wherein *Lilium auratum*, *L. speciosum*, *Francoa ramosa*, *Humea elegans*, tall and brilliant *Codiaeums*, *Acalyphas*, *Gesneras*, *Cattleyas* in variety, *Cypripediums*, *Caladiums*, *Humeas*, *Fuchsia fulgens* and two fine examples of *Laelia elegans* were pleasingly associated against a background of Palms and Bamboos. Second prize was awarded to Mr. W. HOLMES for a very handsome exhibit in which *Ixoras*, *Liliums* and *Codiaeums* were used with fine effect. Sir G. H. KENRICK (gr. Mr. J. Macdonald), Edgbaston, was placed third with a very happy arrangement in which *Ixoras* and *Oncidium*s were conspicuously good; Mr. MANNING, fourth.

In the class for a decorative group of foliage plants arranged on a space of 250 square feet, the premier award was won by Messrs. JAS. CYPHER AND SONS with a beautiful and charac-

teristic display in which fine Palms, brilliant *Codiaeums*, bright *Dracaenas*, bold *Anthuriums*, varieties of *Begonia Rex*, *Selaginellas*, *Phyllanthus*, *Caladiums*, the variegated Pine-apple, and *Acalyphas* were disposed in graceful and rich effect. Second, Mr. W. HOLMES, Chesterfield, who must have been very few points behind the Messrs. CYPHER, as his *Codiaeums* were especially bright; third, Mr. W. R. MANNING, Dudley; fourth, Sir G. W. KENRICK.

There was only one collection of Orchids but this was a good one and secured the first prize for J. MCCARTNEY, Esq. (gr. Mr. Potts), Hey House, Bolton, *Cattleya Venus*, *C. Hardyana*, *Laelio-Cattleya Profusion*, *Odontoglossum grande*, and *Cypripediums* in variety were included in the group. A trophy was added to the first prize.

In the county class for a group of plants, A. M. BAMBER, Esq. (gr. Mr. Bremell), Wellington, led with a pleasing exhibit of *Francoa ramosa*, *Liliums*, *Cypripediums*, *Fuchsias* and trailing *Lobelias*; second, Mr. H. H. HOWELL.

By far the finest group of *Begonias* was the one contributed by Messrs. BLACKMORE AND LANGDON, who made a splendid display of fine plants of grand varieties; second, Mr. A. M. BOWLES, Wellington; third, Mr. H. HEWITT, Shrewsbury. For a smaller group of *Begonias*, H. FIELDING, Esq. (gr. Mr. Reynolds) won first prize.

First prize for a group of aquatic plants and flowers was won by Messrs. BOWLES AND SKARRATT who had a charming little pool of *Nymphacas* surrounded on three sides by *Bamboos*, *Carex*, *Astilbes* and *Senecios* with a low rock work in front, planted with *Heaths*, *Funkias*, *Astilbes* and *Sparaxis*; second, Mr. W. TAYLOR, Grimshill, Salop.

FLORISTS' FLOWERS.

The handsome trophy and £15 offered as first prize for a collection of Roses arranged artistically on a space twenty feet by four feet, were won by Mr. T. ROBINSON, Nottingham, with a brilliant display of clean flowers; conspicuous in this exhibit were the columns of *Independence Day* and *Lord Charlemont*, and the baskets of *Betty Uprichard*, *Hortulanus Budde*, *Phyllis Bide* and *Madame Abel Chatenay*; second, Messrs. GUNN AND SONS; third, Messrs. BEES, LTD.; fourth, Messrs. S. MCGREDY AND SON.

The several entries in the class for a collection of large-flowered Gladioli combined to produce a fine effect, as each was arranged on a space fifteen feet by four feet. A trophy valued at fifteen guineas was added to the first prize of £10. Premier honours were awarded to Messrs. HEWITT AND Co. for baskets of spikes pleasingly arranged, but in many instances there were few opened blooms on the spikes; second, Mr. W. E. SAMUEL, Wrexham, who had finer flowers but a stiff arrangement; third, Messrs. G. MAIR AND SONS, Prestwick, who had wonderfully fine flowers on grand spikes (we counted so many as twelve and thirteen flowers on the spikes), while the arrangement was quite good; fourth, Mr. IVOR THOMAS, Liverpool. We certainly could not understand the basis of judgment in this class.

Messrs. HEWITT AND Co., Mr. W. E. SAMUELS and Messrs. CLEMENTS, DALLY AND Co. were placed in the order of mention in the class for *primulinus* varieties.

Messrs. C. ENGELMANN, LTD., won the trophy and first prize for a collection of perpetual-flowering Carnations arranged on a space eighteen feet by five feet; the Saffron Walden firm had fine masses of *Laddie*, *Red Laddie*, *Saffron* and *Orange Sunstar*. For a smaller collection, Mr. CHARLES WALL won the premier honours.

Messrs. W. TRESEDER, LTD., exhibited the best collection of Dahlias arranged on a space twenty feet by five feet. The firm made a capital display, showing Mrs. E. Beynon, *White King*, *Nancy*, and many other varieties, great and small, and all without wires or any other kind of artificial support. The same firm showed the best collection of *Cactus Dahlias* and here contributed a handsome display of,

among others, *Honesty*, *May Murray*, *Edgar Jenkinson* and *Ballet Girl*.

HARDY FLOWERS.

First prize for a group of hardy flowers arranged on a space of 250 square feet was won by Messrs. BEES, LTD., with a gorgeous exhibit of sheaves of *Hollyhocks* and *Gladioli*, masses of *Kniphofias*, *Lilium auratum*, *L. speciosum*, *Lobelia Hunstman*, *Phloxes*, *Pyrethrum Firefly*, *Agapanthus Mooreanus albus*, *Poterium obtusatum*, *Helianthus* and *Astilbes*, all finely arranged.

Messrs. M. PRICHARD AND SON were placed second for a grand display in which *Poterium obtusum*, *Kniphofias* in variety, *Crinum Powellii album*, *C. Krelagei*, *Gladioli*, *Montbretias*, *Trollius*, *Astilbes*, *Rudbeckias* and *Agapanthus*; third, Messrs. G. GIBSON AND Co., Leeming Bar.

Messrs. BEES, LTD., appeared to be the only exhibitors of a collection of Lilies and other bulbous plants arranged on a space of 100 square feet. They were awarded first prize for a group composed of masses of *Lilium Henryi*, *L. speciosum*, *L. tigrinum*, *L. Sargentiae*, *Gladioli* in great variety, *Crinum Powellii*, *C. P. album*, and *Galtonia candicans*.

Messrs. BEES, LTD., were also successful in the class for eighteen bunches of hardy flowers staged on a ground space of twelve feet by five feet.

Messrs. BEES secured the first prize in the new class for a collection of *Montbretias*, making a capital display on a ground space eight feet by four feet.

In the county class for a dozen bunches of hardy flowers T. H. SHORTING, Esq. (gr. Mr. Butler), Broseley, was the most successful competitor, Capt. BIBBY coming second.

FLORAL DECORATIONS.

One large tent was filled with floral decorations and there was a keen competition for the prizes, so much so, indeed, that fifth and sixth prizes were awarded in several classes.

The best table decoration, Roses excluded, was a charmingly elegant arrangement of *Gloriosas*, *Francoa ramosa*, red *Honeysuckle*, tiny *Celosia* plumes, and a few small *Cattleyas*; second prize was awarded to Miss N. WARREN, Darwen, for a combination of *Gloriosas*, *Francoa*, small *Pentstemons* and *Humea elegans*; third, Miss M. POWELL, Barry; fourth, Mrs. W. H. REYNOLDS, Tettenhall, with pink *Carnations* and *Francoa* sprays.

In the other table decoration class Roses only were allowed, and here there were a dozen entrants, and Mrs. J. NIXON led with a clean design of light orange Roses in low, dark baskets; second, Miss NEWMAN, who showed *Independence Day* in low glass bowls; third, Mrs. MADELEY, Wem, with *Ophelia*.

Mr. CHARLES VICKERS led for a bride's bouquet and two bridesmaids' bouquets, with the former consisting of white petalled *Cattleyas* of the *C. gigas* type, with purple and pale yellow lips, and white *Odontoglossums*. The bridesmaids' bouquets were of deep heliotrope, red-flecked *Carnations* and *Cattleya Loddegesii*. Second prize was awarded to Messrs. A. ADSHEAD AND SON, who had white *Cattleyas*, *Carnations* and *Francoa* in their bride's bouquet, and made up the bridesmaids' bouquets of deep scarlet *Carnations*; third, Messrs. HEWITT AND Co.

Messrs. HEWITT AND Co. obtained first prize for a bride's bouquet (white or coloured flowers allowed), with a design in mauve *Cattleyas*, mauve and white *Odontoglossums* and short sprays of *Francoa*; second, Messrs. A. ADSHEAD AND SON; third, Mrs. J. NIXON.

For a basket of cut flowers, Orchids allowed, Mrs. J. NIXON was placed first with a gorgeous arrangement of *Anthuriums*, *Gladioli*, *Clivias*, *Montbretias* and *Francoa*; second, Mr. C. VICKERS, with *Cattleya Dowiana*, yellow *Arums*, buff *Carnations* and *Gerberas*; third, Messrs. A. ADSHEAD AND SON.

In the basket class, where Orchids were not admitted, there were many fine exhibits. Mrs. J. NIXON led with yellow *primulinus* *Gladioli*, mauve *Delphiniums*, *Thalictrum dipterocarpum* *Astilbe* plumes and *Maple* foliage—a very bold and handsome effort; Messrs.

A. ADSEKAD AND SON second, with bronze Chrysanthemums and soft red and yellow Gladioli; third, Miss NEWSHAM.

Mr. W. WEAVER, Mold, was successful in other classes.

DESSERT FRUITS.

In the class for a decorated table of dessert fruits, the collection to consist of twenty-four dishes, in not fewer than nine distinct kinds, there were six competitors for the Champion Trophy and £25 offered as first prize. These awards were won by the DUKE OF NEWCASTLE who showed a fine collection that included excellent examples of Black Hamburg, Chas-selas Napoleon and Muscat of Alexandria Grapes, Pineapple Nectarines, Triomphe de Vienne Pears, Dymond and Gros Mignonne Peaches, Lady Sudeley Apples, Jefferson Plums, Figs and Melons; he led with a total of 202 points. Second prize was won by LORD BELPER (gr. Mr. J. McCartney), Derby, with 181 points, his set containing fine Muscat of Alexandria and Muscat Hamburg Grapes, and Sea Eagle Peaches; third, the MARCHIONESS OF TWEED-DALE (gr. Mr. A. Bean), Yester, with 168½ points; fourth, Sir CUTHBERT QUILTER (gr. Mr. A. New), with 157½ points.

Col. HAYWOOD LONSDALE (gr. Mr. J. Mills), Shevington Hall, led for a collection of twelve dishes of fruits, showing good Grapes, Peaches, Plums and Melons. The same competitor excelled in the class for nine dishes of fruits.

Mr. S. WITHERS was successful in the county classes for Peaches, dessert Apples and culinary Apples, while Col. T. WICKIN excelled for Plums.

GRAPES.

THE DUKE OF NEWCASTLE was successful in winning the principal award in the class for a dozen bunches of Grapes, in four or more distinct varieties. He exhibited a fine set and the bunches were pointed as follows:—Muscat of Alexandria, 7½, 7½, 7 and 7; Madresfield Court, 9, 9, 8 and 8½; Muscat Hamburg, 8 and 7½; and Black Hamburg, 9 and 8; total 96. Second prize was won by the PWLL-Y-COCH HOTEL (gr. Mr. W. Owen), Colwyn Bay, with 93 points, the Madresfield Court and Muscat of Alexandria being finely represented; third, R. J. CORBETT, Esq. (gr. Mr. J. Jones), Towyn, with 86½ points; fourth, Messrs. J. WEBBER AND SONS, Minehead, with 72½ points.

LORD BELPER had the best four bunches of Grapes, two black and two white, followed by the EARL OF LICHFIELD (gr. Mr. J. Smith), Shugborough Hall. These exhibitors were also successful in numerous other classes. The EARL OF COVENTRY (gr. Mr. H. Wilson), Croome Court, led for two bunches of Black Hamburg Grapes.

Lady JULIA DUFF (gr. Mr. Weaver), Coombe Court, Kingston, scored for two bunches of any other black Grapes, and G. W. MELLOR, Esq. (gr. Mr. C. Price), Abergele, had the best two bunches of White Muscats.

In the county classes E. G. GRIFFITHS, Esq. (gr. Mr. Lee) led for Black Grapes and Col. H. LOVELL led for White Muscat Grapes, with Capt. BIBBY second.

VEGETABLES.

Collections of Vegetables were numerous and the produce shown was of high quality. VISCOUNT HAMBLEDON (gr. Mr. Turnham), Henley, won the first of Messrs. Sutton's prizes for nine distinct kinds, with Mr. T. M. JONES, Llandilo second. For Messrs. J. Carter's and Co.'s prizes for nine dishes, LORD LECONFIELD (gr. Mr. Streeter), Petworth, was awarded premier honours, while for Messrs. Cliban's prizes Mr. W. ROBINSON, Garstang, was the most successful competitor.

In the class provided by Messrs. Dickson and Robinson, Mr. T. M. JONES led, while in the class provided by Messrs. J. Peed and Son, Mr. W. WHEILDON, Coventry, beat Mr. W. ROBINSON, Mr. A. H. HICKMAN and Mr. T. BOWEN, Abernethy, were placed first and second respectively.

In the open class for a collection of twelve kinds of Vegetables the Silver-Gilt Medal and first prize were won by Messrs. J. JONES AND

SON, Ammanford, with a superb set of Carrots, Runner Beans, Celery, Leeks, Peas, Potatos, Tomatos, wonderful Parsnips, Cauliflowers, Beet and Cucumbers; second, VISCOUNT HAMBLEDON

NON-COMPETITIVE.

As already stated, the non-competitive exhibits were very fine; indeed, it was difficult to choose a few for special commendation. It must suffice, therefore, to state that the Hon. VICARY GIBBS (gr. Mr. Edwin Beckett), Aldenham House, Elstree, arranged a surpassingly fine display of vegetables, every dish in perfection. The arrangement was unusual, for in addition to the more substantial part of the exhibit, where Peas, Celery, Leeks, Carrots, Beet and Cauliflowers were disposed against a trellis background, there were several separate tables of choice vegetables, the intervening spaces being planted with perfect Cabbages, Savoys, Kales, Lettuces, Maize and Capsicums, while a little gravel path led around among the plots and tables, and the whole was surrounded by a green grass verge. Messrs. SUTTON AND SONS also contributed a very fine exhibit of vegetables, while the KING'S ACRE NURSERIES filled the end of one section of the big tent with a grand lot of fruit trees in pots, and Mr. W. J. UNWIN, Histon, was responsible for a beautifully arranged group of well-grown Gladioli.

MEDAL AWARDS.

Large Gold Medal and Special Award.—To the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree; Mr. W. J. UNWIN, Histon; and the KING'S ACRE NURSERIES.

Large Gold Medal.—To Messrs. SUTTON AND SONS, for vegetables; Messrs. E. WEBB AND SONS, for vegetables, flowers and fruits; Mr. WALTER TAYLOR, Shrewsbury, for alpine flowers; Messrs. BAKERS, for formal garden; Messrs. DICKSON AND ROBINSON, for Gladioli, Lilies, etc.; Messrs. JARMAN AND CO., for hardy flowers; and to Mr. H. WOOLMAN, for Dahlias.

Gold Medal.—To Messrs. BAKERS, for floral designs; Mr. H. CLARKE, for hardy flowers; Messrs. DANIELS BROS., for a miscellaneous display; Messrs. DOBBIE AND CO., for Zinnias and Roses; Messrs. F. E. FAIRBAIRN AND SON, for Phloxes; Messrs. ISAAC HOUSE AND SON, for Scabious; the KING'S ACRE NURSERIES, for Roses; Mr. J. KLINKERT, for topiary work; Mr. E. MURRELL, for Roses; Messrs. J. PEED AND SON, for stove and greenhouse plants; Messrs. M. PRITCHARD AND SON, for floral designs; Messrs. TOOGOOD AND SONS, for vegetables and flowers; Mr. C. VICKERS, for floral designs; and to the SHROPSHIRE COUNTY COUNCIL for an educational exhibit.

Silver Medal.—To Messrs. ALLWOOD BROS., for Carnations; Mr. E. G. BAYLEY, for flowers and vegetables; Messrs. BLACKMORE AND LANGDON, for Phloxes; Messrs. BOWEN AND SKARRATT, for alpine plants; DICKSON'S NURSERIES, for Roses; Messrs. DOBBIE AND CO., for Potatos; Mr. H. N. ELLISON, for Ferns, etc.; Messrs. J. J. ENGLISH AND SON, for Roses; Messrs. J. FORBES, Hawick, for hardy flowers; Messrs. JEAN AND TROWBRIDGE, for alpine plants; Messrs. JONES BROS., for Carnations, etc.; Mr. JOHN JONES, for Violas; Messrs. J. KELWAY AND SON, for Gladioli; Messrs. MAXWELL AND BEALE, for alpine plants; Mr. E. H. PARSONS, for Apples and other fruits; Mr. W. H. SIMPSON, for Antirrhinums; Messrs. STARK AND SON, for Sidalceas; Mr. W. WELLS, for hardy flowers; Mr. B. WATERHOUSE, for hardy flowers; Mr. JAMES WATSON, for hardy flowers; Miss THOMPSON, for Cacti; and to Mr. W. WATKINS, for hardy flowers.

HARROGATE.

THE horticultural section of the joint agricultural and horticultural show held at Harrogate on August 5 and 6 was opened by the Mayoress and appears to have been a successful venture. This section was organised by a Committee with the Rev. Bernard Hall as its Secretary. The exhibits were housed in a large marquee and were contributed by growers in various parts of the country.

One end of the marquee was filled with Begonias, Lilliums, Trachelium caeruleum and other flowers associated with Davallias and two large Platyceriums, all admirably arranged by Mr. J. G. BESANT, Superintendent of the Harrogate Corporation Parks. No prizes were offered, consequently there was no direct competition, but medals were awarded in accordance with the extent and beauty of the displays, and these awards were as follow:—

Large Gold Medals.—To Mr. T. ROBINSON, Nottingham, for Roses; Messrs. EDWARD WEBB AND SONS, Stourbridge, for flowers; and to THE HARROGATE CORPORATION (Parks Superintendent, Mr. J. G. Besant) for a group of plants.

Gold Medals.—To Mr. C. GREGORY, Chilwell, for Roses; Messrs. G. GIBSON AND CO. Leeming Bar, for herbaceous flowers; and to Messrs. BACKHOUSE NURSERIES (YORK) LTD., for a formal garden and herbaceous flowers.

Large Silver-Gilt Medals.—To Messrs. W. AND J. BROWN, Peterborough, for Roses; and to Messrs. MAURICE PRICHARD AND SONS, Christchurch, for alpine plants.

Silver-Gilt Medals.—To Messrs. KENT AND BRYDON, Darlington, for Phloxes, etc.; Mr. P. GARDNER, Addingham, for a formal garden and rockery; and to Messrs. F. G. MACKENZIE AND SONS, Ilkley, for a formal garden.

Large Silver Medals.—To Messrs. HARKNESS AND SONS, Bedale, for herbaceous flowers; Messrs. ISAAC HOUSE AND SON, Bristol, for Scabious; and to Messrs. MAXWELL AND BEALE, Broadstone, for alpine plants.

Silver Medals.—To Mr. W. BRAITHWAITE, Bedale, for hardy flowers; Mr. R. V. ROGER, Pickering, for alpine plants; Mr. S. GARDNER Leeds, for hardy flowers; Mr. A. H. TODD, Pocklington for Violas; Messrs. WHITAKER AND WILSON, Leeds, for hardy flowers; and to Messrs. A. GREENWOOD AND CO., Wetherby, for alpine flowers.

Messrs. JOSEPH CHEAL AND SONS, LTD., Crawley, were highly commended for new Dahlias.

Messrs. WHEATCROFT, Gedling, received an Award of Merit for the new Rose The Princess Elizabeth; and a similar award was made to Mr. T. HANCOCK, Mansfield, for Rose Charming, Princess.

In the amateurs' section Col. C. F. TETLEY, D.S.O., Kirkman Bank, Knaresborough (gr. Mr. H. G. F. Ogram), received the Harrogate Agricultural Society's Silver-Gilt Medal for the best exhibit. Mr. J. K. WOODMANSEY, Ye Olde Manor House, Knaresborough, gained a Silver Medal and the Gardening Illustrated Medal for British Ferns. V. H. SHEPHERD, Esq., Knaresborough (gr. Mr. R. M. Stockhill), was awarded a Silver Medal for Sweet Peas. Dr. W. LEE SPINK and Mr. C. F. SPINK, North Dene, Balmoral Avenue, Great Yarmouth, received a Silver Medal for a floral display, and Miss WORTH Holbeach, was awarded a Silver Medal for an exhibit of Cacti.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MR. CHAS. H. CURTIS presided at the monthly meeting of this Society, held at the R.H.S. Hall, on Monday, August 8. Six members were elected, and five members withdrew from their deposit accounts sums amounting to £98 7s. 0d. Sick pay for the month, on the Ordinary side, amounted to £97 19s. 11d., and on the State Section to £74 13s. 8d., while maternity claims came to £2 10s. 0d. The sum of £75 1s. 6d. was granted to insured members for dental and optical treatment and ten new cases were considered.

The Secretary produced the Government Auditors' report of the State Section accounts of the Society for the year 1926, all were certified as correct. The resignation of Mr. J. Craik from the Committee was received with regret.

TRADE NOTES.

THE Board of Trade, after consultation with the Minister of Agriculture and Fisheries, the Home Secretary and the Secretary of State for Scotland, has exempted farm and garden seeds from the requirement of the Merchandise Marks Act, 1926, that imported goods sold or exposed for sale under a British name or trade mark must bear an indication of origin.

JUBILEE OF A GERMAN NURSERY FIRM.—The nursery firm of Otto Mann, Leipzig, celebrated on August 15, the fiftieth anniversary of its foundation, and at the same time three members of the staff were in a position to look back upon twenty-five years' continuous service with the firm.

ANSWERS TO CORRESPONDENTS.

DRACAENA LEAVES DAMAGED.—*R. W. R.* In some cases the leaves received showed damage due to drip caused by faulty glazing or condensation. The damage on other leaves appears to be due to the biting action of some beetle, and we suggest that you place traps among the plants and also give attention to the glazing.

CHERRY TREE FAILING TO BEAR FRUIT.—*J. D. W.* It may be that the Cherry fails to bear fruit because the soil is lacking in lime, but it may also happen that it needs to be cross-fertilised by pollen from another variety. You do not state, however, what your variety is.

GRAPES FAILING.—*J. R. B.* Over-cropping, combined with low temperature and the wet condition of the outside border, are probably the causes of the trouble with your Grapes.

NAMES OF PLANTS.—*E. G.* 1, *Magnolia grandiflora* var. *lanceolata*; 2, *Calycanthus occidentalis*; 3, *Spiraea Douglasii*. *T. B.* Conifer, probably *Thuja dolabrata*; the other is probably *Daphne Mezereum*, but both specimens were too scrappy for correct determination. *H. B.* *Daphne Laureola*.

PEACH SPLITTING.—*H. G.* The ripe Peach, possibly a fine fruit of *Crimson Galande*, probably split because solid or liquid feeding had been given too freely after the stoning period had finished; the stimulating treatment was carried on too late and should have been withheld a full three weeks before the fruit ripened.

PHLOXES DISEASED.—*D. W.* Your Phlox plants are suffering from eelworm disease. The eelworms are now migrating down the stems, so that action should be taken so soon as possible to destroy these if such plants are to be propagated from. Full details of the disease and its control appeared in the *R.H.S. Journal* Vol. 49, part 2, July, 1924, page 203.

VINE LEAVES MILDEWED.—*F. E. S.* The cause of injury to your Vine leaves is mildew which is very prevalent this season in cold houses where the temperature has fallen very low at night. This trouble shows plainly on the leaves first and if you had dusted the foliage with flowers of sulphur a fortnight ago, when you first saw the small specks, it is probable the disease would not have spread. As yours is not a bad case, remove any affected berries and lateral leaves, and dust others that are slightly affected. If you keep the border well watered, the house ventilated carefully and the atmosphere moderately moist you should not be troubled further this season.

REMARKS.—With the exception of *Lilium longiflorum* and *Lily-of-the-Valley*, supplies of practically all other flowers have exceeded the moderate demand during the past week. *Asters* and double *Stocks* are somewhat varied in price; these flowers from the open have been damaged by the recent heavy rains and are difficult to clear at a very low price. The quantities of *Carnations* and *Roses* exceed the present demand. Some very fine *Gladioli* are being marketed. Red varieties are the best received so far this season. *Chrysanthemums* are becoming more attractive; both disbudded blooms and spray varieties are much improved in quality. Some very fine blooms of *Duchess*, *Sanctity* and *Mrs. Phil Page* are available. In the plant department the trade is very slack, beyond

the usual varieties of Ferns and Palms. Flowering plants include *Marguerites*, blue *Hydrangeas*, a few *Fuchsias*, and *Campanulas*. Pot *Chrysanthemums* will be greatly welcomed.

REMARKS.—Trade in general is very slow and the market is over supplied with *English Apples*, *Tomatoes*, *Grapes*, *Peaches* and *Nectarines*.

GLASGOW.

A severe slump in prices of cut flowers was experienced last week when *Gladioli* were practically unsaleable at 1s. per box. Quantities changed hands at 3d. per dozen spikes, and special blooms were only worth from 6d. to 8d. for 6's. Other flowers were also cheap. *Sweet Peas*, *Asters* and *Marguerites* being sold at 1d. to 2d. per bunch; *Stocks*, 2d. to 6d.; *Annual Gypsophila*, 2d. to 3d.; *G. paniculata*, 4d. to 9d.; *Carnations*, 9d. to 1s. per dozen; *Roses*, 9d. to 2s.; and *Asparagus* (medium size), 9d. to 1s. *Spray Chrysanthemums* ranged from 3d. to 6d. per bunch; *Bronze Phoenix*, 1s. 6d. to 2s. per dozen; *Countess* (disbudded), 1s. to 1s. 6d. (6's); *No. 1 White*, 1s. to 1s. 3d.; and *Pink*, 1s. 3d. to 1s. 6d.

Good business was done in the fruit market at values which may be described as steady to firm. *Table Strawberries* fluctuated between 9d. and 1s. 6d. per lb.; *Black Currants*, 10d. to 1s.; *Red*, 3d. to 5d.; *Raspberries*, 6d. to 10d.; *Gooseberries*, 1½d. to 3d.; *home Peaches*, 6s. per dozen; *Victoria Plums*, 1s. per dozen; *Czar*, 4d. to 5d.; *Egg*, 8s. per sieve; *Belgian Cherry Plums*, 7s. to 8s.; *Spanish Gages*, 19s. to 20s.; *French Gages*, 7s. 6d. per crate; *Californian Plums*, 16s. to 18s. per 20 lbs.; *William Pears*, 13s. to 14s. per crate; *English Apples*, 3½d. per lb.; *American Red William Apples*, 14s. to 17s. per case; *South African Navel Oranges*, 14s. to 24s. per case, according to counts; and others, 14s. to 20s.

In the vegetable market *Tomatoes* were a little dearer at 8d. to 9d. per lb.; *Marrows* made 4s. to 6s. per dozen; *Cucumbers*, 4s. to 7s.; *Cauliflowers*, 3s. to 6s.; *Lettuces*, 1s. to 1s. 6d.; *dwarf Beans*, 7s. per pot; and *Peas*, 3½d. per lb.

Forestry in
Great
Britain.

No citizen of this country and assuredly no gardener can fail to take an active interest in the afforestation of Great Britain. Indifferent as were most of us, and dilettante as were all our successive governments before the epoch of the Great War, that indifference and dilettantism were mortally stricken by that event, for the war stretched its ruthlessness hard over the three million acres of our woodlands and destroyed nearly 500,000 acres of them. The curious may calculate how vital was the importance of the thousand million cubic feet of timber which this despoiled forest area yielded. In these far-off days when the watchword—how soon forgotten!—was "never again," the Acland Committee appointed by the Coalition Government proposed a wise and far-reaching programme of forest development, which programme it is good to know is in course of execution, not, indeed, at the rate originally contemplated, but, nevertheless, with such speed as to give hope that

ultimately all the three million pre-war forest acreage will be restored to timber production, and much of the waste land suitable for growing trees will be brought under tree cultivation. There is, nevertheless, good reason why all patriotic men and women should lend their active support to the efforts of the Forestry Commission and there is probably no better way of doing this than by their becoming members of the Society of Foresters of Great Britain. A subscription of one guinea entitles the subscriber to Associate Membership of the Society, and carries with it the privilege of receiving the *Journal* of the Society which, judged by the first number which has recently been published by the Oxford University Press, is a privilege well worth having. The editor, Mr. H. M. Steven, has prefaced the *Journal* with a most interesting survey of British forestry which, based as it is on the census of woodlands recently made by the Forestry Commission, gives an accurate picture of our forests in the year 1924. What is evident from this survey is that afforestation on an adequate scale in this country is beyond the powers and disposition of the private owner; if it is to be done at all it must be done in the main by the State. The investigations of the Forestry Commission are already leading to the acquisition of much useful information with respect to the species to be planted in different types of soil. Sitka Spruce (*Picea sitchensis*), of western North America, has proved itself both productive and adaptable, thriving, as Dallimore and Jackson state, from sea-level in mild districts up to a considerable elevation in exposed parts of the Scottish Highlands. Japanese Larch is proving a useful tree for planting under the wet and exposed conditions of the west coast. Douglas Fir (*Pseudotsuga Douglasii*), though liable to suffer from wind and heavy snows when grown in dense stands on wet ground, nevertheless grows well in more favoured situations. No less important than the growing of timber is its marketing, and the *Journal* points out the sour truth that whereas our annual imports of timber amount to ten million loads, of a value of fifty million pounds, home-grown parcels of timber are disposed of only with difficulty. Here is work for the recently established Forest Products Research Laboratory. One of the most interesting articles in this first number of Forestry is that by Mr. H. M. Steven on the silviculture of Conifers in Great Britain. First in order of age and dominance of our trees was the Birch, which was the principal tree of the boreal period, that is, the epoch which immediately succeeded the arctic period. Pine followed, but was long in becoming a dominating tree. The Alder immigrated hither, and with it were associated Hazel, Elm, Oak, Lime, Beech and Hornbeam—pollen of all of which trees has been recovered from the remains in Chatmoss, Lancashire. At the dawn of the Christian era, Scots Pine (*Pinus sylvestris*) was but a subsidiary species in the forests of England but there were Pine forests in the Scottish Highlands. This tree thus had had its ups and downs, and had been, in yet earlier times, more widely spread in this country than it was, say, when Caesar came to Britain. It was not till the sixteenth century that exotic Conifers were largely introduced. During that time *Pinus Pinaster* and Norway Spruce (*Picea excelsa*) were brought hither. Parkinson, in 1629, describes and figures Scots Pine, Larch, Spruce and Cypress. These and other Coniferous trees were first planted as ornamental subjects, and it was not till the beginning of the eighteenth century that Coniferous species began to be grown for

timber production, but even so, the first species to be planted was the indigenous Scots Pine. But those who would get a clear picture of the present position of Forestry in this country must needs read this and other articles contained in the *Journal* for themselves. If they do we think that they will join the goodly company of the Society of Foresters and thereby encourage the object for the promotion of which the Society was founded—an object which ought surely to have the warm approval of all lovers of their country and their countryside. So long, indeed, as professional zeal on the part of the Forestry Commission does not rob us of our lovely playgrounds and natural Nature reserves—replacing the bog land and the staggd and mossy Oaks by stands of dreary Conifers—we shall all wish both the Commission and the Society of Foresters every success in their efforts and increasing powers for the fulfilment of their afforestation plans.

Supplementary Illustration.—*Attalea Cohune*—the Cohune Palm—is a native of Honduras and Guiana, but is widely distributed throughout the West Indian Islands. It is a spineless Palm reaching to a height of fifty feet or sixty feet, with large, erect, ultimately spreading, pinnate leaves. The brown fruits, about the size of a hen's egg, are borne in large, pendent clusters as seen in the Supplementary Illustration of a plant growing in the Botanic Gardens, Dominica. From the seeds an oil is expressed which has a pleasant, nutty flavour, and is considered superior to Coconut oil, but hitherto it has been costly to prepare owing to the thickness of the walls of the fruit and the comparatively small size of the kernels. Special machinery has been recently introduced to overcome this difficulty and oil is now being extracted on a commercial scale. The oil is likely to find a ready use in the manufacture of margarine, for which it is said to be very suitable.

Old Florists' Flowers.—It is with very great pleasure we publish the following letter from Sir Daniel Hall, and we hope sincerely that his efforts to get together a collection of florists' flowers of other days will meet with every success:—The John Innes Horticultural Institution is endeavouring to form and maintain a collection of some of the old florists' flowers which have gone out of favour with the amateurs of to-day and are in danger of extinction. Sixty years ago there were successive shows in many of the towns and villages of the North and Midlands of Auriculas and Gold-laced Polyanthus, Tulips, Laced Pinks, Carnations, etc. The growth of the towns deprived the old florists of their gardens, and a new fashion in gardening sprang up which decried the formal beauty of the old florists' flowers, and poured scorn on the rigid canons of showing that were involved. There must, of course, be two schools of gardening—the one which regards flowers as an element in the design of a garden, and the other which regards a garden as a place in which fine flowers may be grown. The old florists were all for the flower; their gardens were often no more than allotments, dominated, perhaps, by a brewery or a gas works, and the opportunity for lay-out or design did not exist. Of course, at some ideal point the two schools meet, and the gardener may paint his design with flowers that are individually perfect. Meantime, however, the florists' flowers very often failed to meet the need of the gardener, for too generally they were difficult to grow in mass, weakly in constitution or awkward in habit, and they have become displaced by varieties that could be trusted to make a show with less care and management. None the less, the standards of excellence which the old florists evolved will reassert themselves, because they were the fruit of long observation and love of the flower. No one, for example, who has once acquired an appreciation of the flat-petalled, fine-textured, smooth-edged petal of the old show Carnation, will ever be satisfied with the modern Carnation, however much he may recognise its vigour, colour and floriferousness. These are essentials; the work

of the breeder is to couple them with the earlier excellencies of form and texture. In the same way the formal florists' Tulip has suffered an eclipse in favour of the powerfully-built weather-resistant Darwins and their opposite numbers among the Cottage Tulips. Yet the ideals of the old Tulip fanciers are quietly winning back; the rounded, smooth cup of the florists' flower is being preferred to the square profile of the typical Darwin bloom and must eventually become the standard again, just as the pure base will prevail as superior to the blotched base, however superficially attractive the latter may be. It is necessary, then, to preserve representatives of the old florists' flowers; on the one hand they provide a model, a type of proved excellence to which to breed, and on the other hand they may be useful for crossing purposes to the breeder who is endeavouring to combine the old form with the vigour and useful habit of the modern garden flowers. It is, however, becoming difficult to find many of the old florists' flowers that were famous in their day and it is the hope that some may be found amongst readers of *The Gardeners' Chronicle* that this appeal is inserted. The John Innes Institution desires in particular examples of the old show Auriculas, Laced Pinks and Carnations. It has already been helped in regard to Auriculas, both show and alpine, Gold-laced Polyanthuses and Pinks and Tulips, and it possesses a very representative collection of Pelargoniums and Geraniums. I should be grateful if any of the readers of *The Gardeners' Chronicle* can put us in the way of getting specimens of the show Ranunculus, a flower which seems to have become extinct, though scores of varieties are figured in the florists' books of a century ago. But any of the famous old flowers will be welcome, and I can promise that they will be looked after and increased and will always be available for students, breeders and collectors.

"Gardeners' Days" in Magdeburg.—For several days at the end of August, the town of Magdeburg, in Saxony, is keeping a gardeners' festival in the "Schützenhaus," in the lovely Rotehornpark. On the 27th a delegate conference of the Saxony Fruit-growers' and Gardeners' Society is to be held, and on the 29th the Chamber of Horticulture will hold a reception at which numbers of distinguished people are expected to be present.

Trials of New Roses.—For several years past the Council of the National Rose Society has had under consideration the conduct of trials of new seedling Roses, and from time to time there have been rumours with regard to the site for such trials. The whole matter has again been considered by the Council, and we believe that matters have progressed considerably, indeed, we understand the Society has been offered a suitable site on favourable terms, and if arrangements can be completed satisfactorily, it is most probable that in the near future the Society will be holding its own trials under the superintendence of the Hon. Secretary, Mr. C. Page.

Legacies to Gardeners.—The late Mr. Frank Lloyd, of Coombe House, near Croydon, who died on May 20, bequeathed the sum of £600 to his head gardener, Mr. Mark E. Mills.—Mrs. Mary Anne Smythe, of Newbold Beeches, Leamington, who died on May 14, bequeathed £150 to her head gardener, Mr. George James.—The late Alderman John Ashburner Nix, of Tilgate, Crawley, who died on May 9, leaving property to the gross value of £212,213, left £100 to his head gardener, Mr. E. Neal.

The R.H.S. Daffodil Show, 1928.—The Royal Horticultural Society's Daffodil Show will be held next year on April 17 and 18. The schedule of eighty-eight classes is ready, and may be had on application to the Secretary, R.H.S., Vincent Square, Westminster, S.W.1. The competitions are open to all residents in Great Britain, Ireland and the Channel Islands, whether they are Fellows of the Society or not, and there are no entrance fees. In addition to the open classes, there are special sections for amateurs, novices who have never won a first prize at a R.H.S. Daffodil Show, and market growers. For the sake of growers who do not purchase the expensive new varieties, it has been stipu-

lated in a number of classes that the varieties exhibited must have been listed in a retail catalogue in the autumn of 1927 at a price not exceeding a certain specified sum. It is hoped that these classes will attract exhibitors who are not Daffodil specialists, but who are keen admirers of these spring flowers.

Mr. F. S. Sillitoe.—In the King's Birthday Honours List of the present year appeared the name of Mr. F. S. Sillitoe, as the recipient of the M.B.E. for services rendered as Superintendent of Gardens, Khartoum, Sudan. Mr. Sillitoe was selected for his present position by the Director of the Royal Gardens, Kew, and left England to take up his duties in March, 1903, so he is one of the oldest of Sudan Government officials. The history of the final overthrow of the Khalifa by Lord Kitchener at Omdurman, in September, 1898, after the country had been ravished by the Dervishes for thirteen years is well-known, following the death of General Gordon and of the Mahdi in 1885. The present Palace at Khartoum, the residence

MR. F. S. SILLITOE, M.B.E.

of the Governor General, is erected on the site of the one occupied by Gordon, and has a garden of some eight acres, laid out and planted with lawns, trees and flower beds, in fact, in keeping with Kew or other large English gardens. Four grass tennis courts are planted with *Cynodon Dactylon*. The heat is intense, and there is practically no rainy season, so that irrigation is carried on throughout the year, water being pumped up by small, electrically-driven, centrifugal pumps from the Blue Nile, in which there is a difference of some twenty feet between high and low flood. During the winter season Bougainvilleas provide a wonderful blaze of purple. Among Roses only the Hybrid Teas succeed, but they are a great success. The following trees and shrubs add to the brilliant show of colour:—*Poinciana regia*, *Spathodea nilotica*, *Cassia Fistula*, *C. grandis*, *C. siamea*, *Bauhinia purpurea*, *B. variegata*, *Euphorbia pulcherrima* (the Poinsettia), *Bignonia venusta*, *Beaumontia grandiflora*, *Quisqualis indica*, *Antigonon leptopus*, *Ipomaea Leari*, and other species; *Tecoma stans* and *Caesalpinia pulcherrima*. *Phlox Drummondii*, *Zinnias*, *Cosmeas*, *Petunias*, *Dianthi*, *Verbena erinoides*, *Celosias*, *Sunflowers*, etc., thrive from November till February. Mr. Sillitoe was born at Redhill, Surrey, in 1877, and commenced his training with Messrs. J. Cheal and Sons, of Crawley, staying there four years. Possessing the spirit of adventure and a desire to go abroad, he went to the Chelsea nurseries of Messrs. J. Veitch and Sons, and for two years worked in their New Plant Department under the late

Mr. John Heal. Then followed three years at Kew in the Tropical Orchids and Propagating Departments. A curious coincidence is that while there he and Mr. Dawe—now in Sierra Leone—were equal firsts in the British Botany course, and within a year Mr. Dawe was his nearest Kew neighbour, in Entebbe, Uganda, and at Christmas, 1904, Mr. Dawe called on him at Khartoum, having travelled the whole Nile route from the south. In 1919, Mr. Sillitoe made a tour of the Yei River valley, along the Congo border, and made a fine herbarium collection from an area not touched since Schweinfurth visited it in 1870. During last winter, Mr. Sillitoe spent some months at Port Sudan, on the Red Sea, laying out the Public Gardens. He is now in England, but is returning this month to complete that work and also some further schemes in Khartoum. His Highness the Sultan of Egypt conferred upon Mr. Sillitoe the Order of the Nile in 1919.

Jubilee at a German Horticultural College.—The Higher Horticultural College at Koestritz, in Germany, was founded so long ago as 1887, and is celebrating this year its fortieth anniversary. At the same time, the seventy-fifth birthday of the founder (and for many years Principal) of the college, Dr. Settegast, is being celebrated. Quite a round of festivities marked this double anniversary, which took place at the end of July and beginning of August, including a festival service on Sunday morning in the local church, followed by a luncheon at the "Goldene Löwe."

The Selborne Society.—The appeal which Lord Montagu of Beaulieu, Lord Avebury and Sir John Otter are making on behalf of a new Bird Sanctuary for the recently enlarged Borough of Ealing (see p. 141) is a reminder that when the Selborne Society was started, more than forty years ago, it was first of all for the "Protection of Birds," and afterwards of "Plants" and "Places." A great deal has recently been done for the feathered fauna, both by Societies which have since sprung up, and by individuals, but it will be a long time before there are too many bird sanctuaries, and it must be remembered that every one, if properly maintained, is an open space unspoiled. Some time ago, the Plant Protection Section of the Selborne Society, under the presidency of Dr. Rendle, Keeper of Botany in the British Museum, started a new and vigorous campaign, which included the circulation of many thousands of leaflets written specially for teachers, for pupils and the general public, respectively. The lean years of the war, unfortunately, however, stopped it for a while, but the pressing need for renewed action is brought home to all thoughtful persons every day, for what pleasure can they derive from "Places" which are carpeted with litter instead of with flowers and Ferns? We understand that the Selborne Society intends to take up activities in this direction again.

A New Journal of Agriculture.—The Ministry of Agriculture for Northern Ireland has published the first issue of a *Journal* dealing with agricultural and horticultural subjects. It is published annually by His Majesty's Stationery Office, 15, Donegall Square West, Belfast, price 2s. 6d. net. The more important articles include "Notes on Experiments relating to Loss of Vigour in Stocks of Potatoes," by Mr. W. J. Megaw; "Experiments in Northern Ireland with various types of Phosphatic Fertilisers," by Dr. G. S. Robertson; "The Control of American Gooseberry Mildew in Northern Ireland," by Mr. Arthur E. Muskett; and "The Cutting of Majestic Seed Potatoes," by Mr. J. G. Rhynehart. In a foreword, the Rt. Hon. E. M. Archdale, Minister of Agriculture for Northern Ireland, states that the object of the *Journal* is to provide a medium for the publication of the results obtained by the different Research Divisions attached to the Ministry of Agriculture for Northern Ireland. The article on the control of American Gooseberry mildew deals with one of the most serious diseases with which fruit growers in Ireland have had to contend during the past two decades. Two sprays with polysulphide specific have proved to be effective in controlling American Goose-

ATTALEA COHUNE IN FRUIT.

berry mildew, the first spray to be applied immediately after flowering, and the second three weeks later. Ammonium polysulphide used with soft soap has given the best results, and these are followed very closely with those obtained by using lime sulphur with skimmed milk or flour paste as spreading and sticking agents. With regard to the loss of vigour in stocks of Potatoes, Mr. Megaw states it has been definitely established that deterioration is mainly, if not altogether, due to a group of virus diseases, the two most common of which are leaf-roll and mosaic diseases. Advice is given that where leaf-roll or mosaic is present to any serious extent, a change of seed is required. With regard to the cutting of seed Potatoes, it is indicated that no serious disadvantage may be expected from the practice of cutting seed Potatoes of the Majestic variety, provided such cutting is done at the time of planting. If it is not possible to cut the tubers as they are being planted, it is recommended that the period between cutting and planting should be as short as possible, and the cut tubers kept in a moist atmosphere.

Bulbs for the Royal Parks.—The Office of Works, in conjunction with the Empire Marketing Board, has decided to purchase 170,000 British-grown bulbs for planting in the Royal Parks, London. The bulbs will embrace seventy varieties of Tulips; they will be supplied by bulb merchants in this country, through the Horticultural Trades Association, and the cost will be borne equally by the Office of Works and the Empire Marketing Board. It will be remembered that some 50,000 Dutch bulbs were planted in Hyde Park last year, these being received as a gift from the Dutch growers, and that strong comments were made in horticultural trade circles that they were not obtained from home sources. In the three previous years many thousands of bulbs were presented to the Office of Works by the *Evening News* for planting in Hyde Park.

Westonbirt as a School.—Westonbirt, Tetbury, Gloucestershire, the residence of the late Sir George Holford, was recently offered by auction and withdrawn, as the reserve price was not forthcoming. Negotiations are now progressing for its purchase by the Rev. P. E. Warrington, Vicar of Monkton Combe, Bath, the founder of Stowe School, who proposes to convert it into a high school for girls.

Appointment.—Mr. J. Robbie, Student Gardener, Royal Botanic Gardens, Kew, has been appointed by the Government of the Sudan, Assistant Superintendent of Gardens, Khartoum Province.

Mr. J. M. Bridgeford.—The many friends of Mr. J. M. Bridgeford, Managing Director of Messrs. Watkins and Simpson, will be interested to learn that he has returned from his visit to Canada and the United States, and has greatly enjoyed his tour. He landed at Quebec on July 8 and visited Montreal, Vancouver and Victoria, British Columbia. After a week's stay in Canada, he proceeded to San Francisco, California, where he met Mr. Lester Morse and Mr. Frank G. Cuthbertson, son of Mr. William Cuthbertson, who accompanied him on a long visit to Messrs. C. C. Morse and Co.'s seed farms at Selinas. Mr. Bridgeford next visited some of the great southern Californian seed farms, including those of the Waller-Franklin Co. at Guadalupe, the Bodger Seed Farm at Lompoc, the Floradale Farms of Messrs. W. Atlee Burpee and Co., at Lompoc, and Messrs. John Bodger's Sons Co.'s seed farms at Los Angeles. While in British Columbia Mr. Bridgeford met Mr. Bennett of Victoria and passed a very interesting time inspecting his extensive collection of alpine. Mr. Bennett is collecting, on behalf of the Royal Horticultural Society, some of the native alpine with a view to introducing them to Wisley. In southern California, Mr. Bridgeford met Mr. O'Melveny, a very enthusiastic amateur gardener who owns a large ranch near Los Angeles, and Mr. Bridgeford has brought home seeds of many interesting Californian alpine from the neighbouring mountains. Another interesting visit was made to the ranch of Mrs. Bryant, an enthusiastic amateur, who is planting as many of the native trees and plants as she

can obtain, on her extensive estate, and she is erecting an herbarium in which dried specimens of the plants she is growing will be exhibited.

Appointments for the Ensuing Week.—**MONDAY, AUGUST 29:** Royal English Horticultural Society's meeting (five days). **TUESDAY, AUGUST 30:** Royal Horticultural Society's Committees meet. **WEDNESDAY, AUGUST 31:** Dufftown Flower Show; Kelso Flower Show. **THURSDAY, SEPTEMBER 1:** Paisley Florists' Society's show (two days); Royal West Renfrewshire Horticultural Society's show (two days); Greenock Flower Show (two days); Islay Flower Show. **FRIDAY, SEPTEMBER 2:** London Allotments and Garden Show; Alloa Flower Show (two days); Darvel Flower Show;

originates with M. de Pannewitz, the inventor of a process for converting the fibrous matter of Pine leaves into textile threads. The *Pinus sylvestris*, or wild Pine, is the species which, in the case under notice, yields the fibrous material, but every member of the Pine and Fir tribes may, it would appear, be turned to similar account. The leaves of these trees consist of a woolly or cottony matter, agglutinated together by means of a resinous substance. The latter, by chemical solvents, may easily be removed, leaving the woolly matter free, and when removed may be turned to good account as the basis of a medicinal bath. The vegetable wool thus produced is woven into counterpanes, blankets and other similar articles. It has been used for a considerable period in

FIG. 69.—ODONTOGLOSSUM GRANDE VAR. ODDITY.

R.H.S. Award of Merit, August 16. Flowers pale yellow and brown. Shown by Messrs. Sanders (not Messrs. Stuart Low and Co. as stated on p. 157).

Kirkcaldy Flower Show (two days); Leith Flower Show (two days). **SATURDAY, SEPTEMBER 3:** Hemel Hempstead Horticultural Society's show; Alnwick Horticultural Society's show.

"Gardeners' Chronicle" Seventy-five Years Ago.—Wool from the Vegetable Kingdom.—Two very extraordinary applications of Fir tree leaves to useful purposes have been made in a domain called the "Prairie of Humboldt," near Breslau, in Silesia. One consists in the extraction from them of a fibrous material which has been termed "vegetable wool," the other in the establishment of medicinal baths with the refuse balsamic fluid, liberated in the course of the former manufacture. The establishment of both these manufactures

many of the charitable institutions of Vienna, and is much approved of. Amongst other advantages, textures of this substance possess the excellent quality of banishing all manner of insects, which are driven away by a certain odour, not at all disagreeable, which the fibre never loses. *Gardeners' Chronicle*, August 28, 1852.

Publications Received.—*Modern Bee-keeping*, by Herbert Mace; The Publisher, Station Road, Harlow, Essex; price 5/- net.—*Income Tax Up-to-date*, by H. J. Gully; Revised Edition; The *Financial News*, 111, Queen Victoria Street, E.C.4; price 9d.—*How to Photograph Flowers and Gardens*, by J. A. Williams, The Fountain Press, Ltd., 14, Clifford's Inn, Fleet Street, E.C.4; price 1/- net.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Albino Cypripediums.—The albino Cypripediums include *C. Curtisii* Sanderae, *C. Lawrenceanum* Hyeaen, *C. callosum* Sanderae, *C. Maudiae*, and hybrids between these varieties, the plants usually flowering during the late spring and early summer. They are attractive and useful Orchids that need the heat of the warmest division and a position where they can be shaded from strong sunshine. If the plants have passed out of bloom examine them with a view to providing new rooting material for those that require it. These Cypripediums thrive best when grown in the old peat and moss compost, but as the former is difficult to obtain, it is advisable to add some A.I. Fibre to make it durable. Plenty of drainage is necessary, as much soil about their roots is undesirable, and every endeavour should be made to keep the compost sweet and open. All through the growing season the roots of these tessellated-leaved Cypripediums should be watered freely and a humid atmosphere maintained around them at all times. Light sprayings overhead with soft, tepid water, when the weather is favourable, are very beneficial and help to keep the foliage free from thrip.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Peas.—Should mildew appear on this crop, as it often will on wet and heavy land, spray the haulm every ten days with sulphide of potassium at the strength of one ounce to three gallons of water. Apply the fungicide during the evening.

Onions.—The present is a suitable time to sow Onions in the open to withstand the winter. Sow the seeds in drills made from fifteen inches to eighteen inches apart on rich, well-prepared ground, such as has been cropped with Peas or Potatoes. A little bone-meal should be forked in the soil when preparing it, and a liberal dressing of burnt garden refuse and a little soot raked well below the surface before making the bed solid. The crop from this sowing will prove very useful next season about the time when the supply of old bulbs is becoming exhausted. Good varieties for present sowing are Premier, Ailsa Craig, Cranston's Excelsior, Carter's Record, Giant Rocca, Lisbon, and the Tripoli section. Choose a fairly open situation, and so soon as the seedlings are through the soil, stir the soil between the rows with the Dutch hoe and again on frequent occasions throughout the growing season. This crop is rarely attacked by the Onion fly, and may be relied on to give good results.

Cauliflowers.—A sowing of Cauliflower seed should be made about now, either in the open ground on a border or in a cold frame. So soon as the little plants are strong enough, prick them out on a very sheltered border, where they may be protected in very severe weather or, better still, in a cold frame, where they can be protected with ease. Keep the frames well aired so that the plants may grow very sturdily; some of them may be planted in their permanent positions about mid-March, according to the season. Never allow the plants to become drawn or they will be too enfeebled to withstand the rigours of the cold and changeable weather which generally prevails in early spring. Where frame space can be spared some of the strongest plants should be put direct in them, at a suitable distance apart; these will not need trans-

planting again, and will naturally give the earliest heads. I find that if a little fire-heat is given this crop when necessary a very early supply can be obtained; but do not allow the plants to be coddled at any time. Varieties suitable for this purpose are First Crop, Magnum Bonum and Early London; the last is the hardiest, though the growth is, perhaps, not quite so compact as that of the first named varieties.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brocket Hall, Hertfordshire.

Violets.—Violets that are being grown out-of-doors for flowering in frames during the autumn and spring months have this year made very satisfactory growth. Remove all the runners as they appear so that the crowns may receive every encouragement to become strong and well-ripened. A light dusting of soot occasionally will be found very beneficial, and if the weather becomes dry the plants should be sprayed during the evening, taking care that the moisture reaches the undersides of the leaves. Red spider is very partial to Violets, and unless some means are taken to keep this pest in check, good results cannot be obtained.

Bush Chrysanthemums.—These plants have well filled their pots with roots, and to keep them in a healthy condition they will require some manurial assistance. Liquid manure from stables or cowsheds is an excellent stimulant to commence with; this, alternated with soot-water, and a little later with a concentrated Chrysanthemum manure, will keep the plants in a healthy condition. Much will depend on the weather; should it be wet and dull care must be taken not to overfeed the plants or they will make soft, sappy growths, which neither produce flowers in quantity nor of quality. It often happens during showery weather that these plants are overlooked with regards to watering, and it is during these times that great care is necessary to ascertain the requirements of the roots. Plants that have produced good leaves will ward off much rain, and often the roots will be found to be quite dry. Mildew will be a source of trouble and must be checked on its first appearance, otherwise the plants will soon be defoliated, the flowers poor in quality, and fail to keep when cut. Attend to the staking and tying of the young growths to prevent them being broken by high winds. Plants intended to produce large blooms will need frequent attention with regards to feeding the roots and tying the growths. In feeding the roots the grower must be guided by the weather and the growth of the individual plant.

Hippeastrums.—The earliest batch of Hippeastrums have completed their growth and water should be withheld gradually from the roots. Expose the bulbs fully to the sunshine to ripen them thoroughly. At this date the plants may receive much cooler treatment and be given an abundance of air whenever the outside conditions are favourable. Seedlings should not be dried off but kept growing in a moderate temperature through the winter.

Adiantum cuneatum.—Where Maidenhair Ferns have been kept growing steadily during the latter months they should be given plenty of room to develop their fronds. When in full growth this Fern needs an abundance of moisture at the roots and frequent applications of liquid manure and soot-water. As the plants are grown under cool conditions, watering the roots and the damping of the floor, etc., must not be done late in the day, otherwise moisture may be deposited on the plants in the form of dew in the morning. A little top ventilation, both night and day, will prevent this. Grown under these conditions fronds will be obtained that will last well when the plants are used for decorative purposes as well as when cut to supply decorative foliage.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Strawberry Plants.—Young layers in small pots intended for planting in well prepared beds for fruiting next year have filled their pots with roots, and should be set out so soon as possible in order that they may become well-established by the end of the growing season. If the soil was prepared for their reception some time ago, it will have settled down and be firm enough for planting, but where this has not been done, choose a piece of ground that is in good heart and requires but little preparation. The soil for these plants should be moderately firm, well-drained and not too heavily enriched with manure which would favour coarse, soft growth. Set out the plants in rows two feet apart each way, and make the soil quite firm about the roots as the work of planting is proceeded with. If several varieties are grown to ensure an unbroken supply of berries over a long period, plant the earliest sorts on one side of the bed and the others in their order of ripening, finishing with the very latest on the opposite side. After the planting is completed rake over the soil between the rows and if the land is light in texture apply a mulch of suitable material. If the plants have not been specially prepared in small pots for planting runners may be lifted from the old beds with a trowel, with good balls of soil and roots, and be planted either singly or in triangular fashion, allowing a space of four inches between each of the three plants thus set out. For this purpose the best of the well-rooted runners should be used, and with suitable weather the plants should grow freely and develop good, sturdy crowns by the end of the present season. Pinch out all runners so soon as they develop to direct the energies of the plant into the development of sturdy crowns. Keep the bed clear of weeds.

Peaches.—Examine the trees of late Peaches and Nectarines and expose the individual fruits as much as possible to the sun. Varieties that ripen at the end of September and early in October are always useful and much appreciated for dessert purposes. A little extra attention given the fruits will well repay the cultivator. Keep a watchful eye for earwigs; these pests are very numerous in some gardens, and destroy many of the best Peaches and Nectarines. They may be trapped in hollow Bean stalks cut into lengths of eight inches and placed behind the branches of the trees here and there. The canes should be repeatedly examined and the insects either blown or shaken into a pail containing paraffin emulsion or some other insecticide sufficiently strong to kill them.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Orchard House Trees.—Early fruits in the orchard house will be over, but those of midseason sorts will be ready for use and very late ones swelling freely. The management of the trees until the house is cleared includes liberal ventilation, syringing on fine mornings with soft water, and watering the roots carefully, using clear water in the case of trees with fruits ripening, and the later ones with liquid manure and other liquid stimulants. Early Pears and Plums, as in the case of early Peaches, should now be watered with clear water, but the later sorts should be given slight stimulants, both in liquid and solid form, the latter as top-dressings, as often as is necessary. If well cropped, the trees will not be making much growth, but laterals and sub-laterals should be kept pinched to allow light and air to enter the trees and also to cause the flower buds, which should be ripe by the end of September, to gain strength. When the fruits approach ripeness they cannot be handled too carefully, as the slightest pressure produces a bruise, fermentation follows, and the flavour is destroyed. Each fruit should be gathered before there is any danger of it dropping;

numbers of good growers do not pay nearly sufficient attention to gathering and packing their fruits; they need to be uniformly firm and solid in the box to travel safely.

Pot Fruit Trees.—The potting of fruit trees being now well understood, I need not give details, but would emphasize the great importance of the balls of soil and roots being thoroughly moist before the plants are turned out of the pots. September potted trees should have one good watering and be syringed lightly to keep the foliage fresh until all the flower buds are mature. If maiden trees in eight-inch or nine-inch pots have not been repotted they should be transferred to receptacles two inches larger so soon as the flower buds are well set. Old trees which may require reducing should also be attended to. Pick out a quantity of the exhausted soil with a pointed stick, shorten the strongest roots and transfer them to a dry pot of a similar size. Use the compost in a fairly dry state, working the tree up and down to keep the roots well apart from each other, and finally make the soil thoroughly firm by ramming. Early Plums and Pears may require larger pots, but of two evils it is better to have medium-sized pots full of roots than large ones containing compost which is not occupied by the roots. Cherries set their fruits best when the roots are pot-bound and the fruit will be of splendid quality provided the trees are top-dressed and fed properly throughout their growing season.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Plants for Summer Bedding.—Foliage plants used for sub-tropical bedding or for giving relief to beds of flowering plants should be raised from seeds sown sometime during September. I refer to such subjects as *Grevillea robusta*, *Jacaranda*, *Eucalyptus*, *Centaurea candidissima* and *C. Clementi*. The sowing of the stronger and quick-growing *C. gymnocarpa* may be deferred until early in the new year. If required for bedding purposes, *Humea elegans* should now be raised from seed. *Begonia semperflorens*, of which there are many fine varieties, is an ideal plant for summer bedding and deserves to be more generally used for this purpose, for the plant is more or less indifferent to weather conditions, thriving equally well during hot, dry weather as in wet, sunless summers. Some cultivators sow the seeds now to obtain large plants for placing out-of-doors next season. While this may be necessary in the colder parts of the country, it is unnecessary in the south, where excellent stock may be raised from a sowing made during January. If the seeds are obtained from a good source the different varieties come practically true to type. These *Begonias* may also be increased from cuttings rooted early in the year, but this method entails wintering stock plants. When propagating by this method care should be taken to select young shoots from the base of the plant, as flowering shoots, although they will root, seldom break into growth.

Permanent Beds of Hardy Plants.—Wherever possible, beds of hardy herbaceous plants should take the place of the usual summer bedding subjects; such plants are specially suitable for furnishing large, isolated lawn beds, and now that they are in flower is a good time to take note of any that is likely to suit one's purpose and conditions. The following are useful for the purpose, viz., *Salvia nemorosa* and *Eryngium yuccifolium*, the latter interplanted with *Campanula persicifolia* to which it forms a succession. By planting two subjects in the same bed, a good deal may be done towards maintaining a long flowering period; thus, many bulbous plants may be used for giving a display during the spring. *Narcissi*, for example, may be planted in beds of *Paeonies*, their flowers showing well against the brightly-coloured young shoots of the *Paeonies*. *Gladiolus* in many varieties or *Hyacinthus candicans* may also be used in similar beds to give a late display. Other plants that may be effectively used are *Helenium*

autumnale var. *pumilum*, *H. Crimson Beauty*, *Bocconia cordata*, *Achillea filipendulina*, *Erigeron Merstham Glory* and *E. Quakeress*, *Veronica subsessilis*, *Geum Mrs. Bradshaw*, *Catananche caerulea*, *Poterium obtusatum*, *Monarda didyma* (in a cool, moist position), and *Helianthus rigidus* var. *Miss Mellish*. *Hollyhocks* and *Michaelmas Daisies* are also useful, especially where large beds are required. Some of the strong-growing, free-flowering *Kniphofias* are also suited to this purpose. Many of the plants mentioned are also suitable for planting in large, informal drifts in the semi-wild parts of the garden.

Propagation of Bedding Plants.—This work should be commenced forthwith; in the case of some subjects, such as *Pelargoniums*, it is wise

FIG. 70.—WATSONIA ORANGE BEAUTY.

R.H.S. Award of Merit, August 16. Flowers pale orange. Shown by Lady Aberconway and the Hon. H. D. McLaren, Bodnant. (see p. 157).

to propagate the quantity required at this time, so that any losses that may occur during the winter may be made good by rooting the tops of the rooted cuttings early in the new year. In the case of many soft, quick-growing plants, it is only necessary at this time to propagate the required number of stock plants to carry over the winter. Where large plants of *Heliotrope* and *Fuchsias* are required, the desired number should be rooted this month and the plants grown steadily on throughout the winter. Cuttings of *Violas*, *Pentstemons* and *Calceolarias* should be inserted in beds of sandy soil in cold frames.

Hardy Annuals.—Where conditions permit of the plants wintering safely, hardy annuals are best sown during the autumn, for apart from the fact that they give an early display, they are nearly always better than when spring-sown.

While some of them are hardy under almost any circumstances, many of them suffer during the winter in cold, wet, heavy soils, and in low-lying situations; generally, they are a success in light, warm, well-drained soils. It is important to make the ground firm as this favours the development of strong, stocky, sturdy growth. Thin sowings and early thinning are also of great importance; probably more annuals are spoiled by overcrowding than from any other cause. All the hardy annuals may be expected to succeed from autumn sowings.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Bulbs for Forcing.—The potting or boxing of bulbs which are required to flower at Christmas should be attended to so soon as they are received from the bulb merchant. A rich compost of loam, leaf-mould and sand should be used, and ample drainage must be provided so that when the pots or boxes are plunged in sand or ashes there will be no danger of them becoming water-logged and the soil turning sour. To secure good pots of either Roman or Miniature *Hyacinths* with the plants flowering simultaneously, the boxing method is the best, as when the time arrives to remove them from the plunging materials, it will be easy to see which bulbs should be placed in the same receptacle to make up a well furnished pot. The plants may be lifted from the boxes without undue disturbance, and they will soon grow into good specimens. The later ones from the same box may be treated likewise to form a succession. In choosing a site for the plunging bed preference should be given to a cool, shady place, where the roots will develop more freely than in a hot, dry situation.

Cuttings.—In order to secure good plants for another season, cuttings of many half-hardy subjects, such as *Heliotropes* and *Fuchsias*, should be inserted now. Make the cuttings from short-jointed shoots, place them singly in small pots filled with a sandy compost, keep them shaded carefully for a fortnight, and they will soon strike and may later be placed in larger pots as found necessary. Where *Pelargoniums* are largely employed for summer bedding, the propagation of these plants should be commenced now. Go carefully over the beds and remove some of the side-shoots for making cuttings; these shoots will not be greatly missed and the plants will give a display for another month. *Pelargonium* cuttings inserted now should not be watered in, as they are inclined to damp off if made wet; if the cuttings are sappy they may be allowed to lie exposed to the air for twenty-four hours after they are made, to dry them up. *Viola* cuttings rooted at this time in portable frames may have the frames removed from them later; the frames will be available for other plants needing protection.

Lawns and Sport Grounds.—Where grass has been worn by much traffic or play, the first opportunity should be taken during showery weather to apply a top-dressing of some quick-acting fertiliser, such as sulphate of ammonia, at the rate of from one to two ounces per square yard. Make sure that the fertiliser is well washed down to the roots of the grass before using the lawn-mower or roller again. Bowling greens should be kept free from Clover and other broad-leaved weeds by the frequent use of sulphate of ammonia, but where the Clover is very plentiful the green should be scythed evenly and carefully before applying the fertiliser. This operation of scything is best performed in the early morning while the dew is on the grass, and great care is necessary to avoid ribbing the turf. Worms are often very troublesome on bowling greens during the autumn and should be destroyed by a worm-killing powder or liquid at the strength recommended by the makers. These wormkillers are usually composed of corrosive sublimate in solution with other chemicals, and while ridding the lawn of worms, have a beneficial effect on the grass if used according to the directions given by the makers.

TREES AND SHRUBS.

CLETHRA.

THE Pepperbush, *Clethra alnifolia*, is one of the most common as well as the most sweetly-scented of shrubs. Mr. E. H. Wilson states, in the *Bulletin* of the Arnold Arboretum, that it is abundant in swamps, woodlands and moist places from Maine to Florida; its blossoms fill the air with fragrance in late July and August. Unfortunately, the leaves are too often disfigured by attacks of red spider, but this year the bushes in the Arnold Arboretum are clean and healthy.

A second species, known as *C. tomentosa*, blooms later. Hailing from North Carolina and Florida, this is also quite hardy in the Arboretum and may be distinguished from the common Pepperbush by a covering of white hairs on the lower surface of the leaves.

Another American species is *C. acuminata*, native of the southern Appalachian Mountains. This is not so attractive in blossom as the species already mentioned, but its polished cinnamon-brown stems make it singularly attractive in the winter season.

The only other species grown in the Arnold Arboretum is the Japanese *C. barbinervis*. This has spreading inflorescences of pure white, nodding flowers and is the first of the Pepperbushes to bloom. Widespread in Japan, in the Nikko region and elsewhere, it is often a bushy tree thirty feet tall. It is the handsomest of the *Clethras* hardy in New England.

ACANTHOPANAX RICINIFOLIUS.

MR. E. H. WILSON considers this one of the noblest trees of the cool, temperate regions. It occurs wild, scattered through moist forests from the extreme south to the limits of northern Japan, but is most abundant in Hokkaido, where it grows to a large size, and specimens eighty feet tall with a trunk from fifteen feet to twenty feet in girth are not rare. In Korea and central and western China it is also a valuable timber tree. In old trees the bark is grey and deeply furrowed, the branches thick and spreading to form a flattened or rounded crown. In young trees the branches are erect-spreading and both they and the trunk are armed with short, scattered, stout spines. The dark green leaves on long stalks are very like those of the Castor-oil plant (*Ricinus*), hence the specific name. Each branchlet terminates in a broad, flat compound cluster of white flowers which are rapidly followed by small, jet black fruits. The large and handsome palmate leaves give this tree a tropical appearance, yet it is perfectly hardy in the Arnold Arboretum, quick-growing, and thrives in ordinary garden soil but prefers a moist situation. So far as is known, it is not attacked by any insect or disease.

HYPERICUM AUREUM.

At the time of writing (early August) two fine plants of *Hypericum aureum* are to be seen in bloom in the gardens of the Greystone Estate, New York. The one is in the form of a rather dense bush, about four feet or five feet in height, and planted on the side of a steep bank it forms a pleasing feature, with its deep yellow flowers contrasting well with the glaucous green foliage.

The other specimen is a standard bush, eight feet in height. The head is dense and bushy, and four feet or more in diameter. The flowers are borne in clusters at the termination of each shoot. They are an inch-and-a-half in diameter and sessile. The centre of each flower is occupied by a dense cluster of deep yellow stamens about three-quarters-of-an-inch in diameter.

The flowers are succeeded by a conical fruit half-an-inch in length, and the five, unequal, leaf-like sepals persist at the base. Unless seed is required, it is advisable to remove these fruits as they form, for they are produced in great abundance, and the vigour of the plant is expended on their formation if they are allowed to remain.

The shrub possesses undoubted merits as a garden plant, and it is to be regretted that it is

not seen to a greater extent in English gardens. Of its hardiness there can be no question for it withstands the severe winters experienced in this part of the world, and as one of its greatest merits lies in its late flowering, it follows that late frosts would not damage it in Britain. *T. H. Everett, New York, U.S.A.*

FLORISTS' FLOWERS.

EARLY-FLOWERING CHRYSANTHEMUMS.

IN spite of the popularity and usefulness of the modern Dahlia, which has undoubtedly become a serious rival to the early-flowering Chrysanthemum, the latter still retains a position of importance, both as a border plant and for cut flower purposes and, although the great beauty of the cut flower in some sections of the Dahlia cannot be gainsaid, it is more difficult to display it in the market in an attractive condition than the Chrysanthemum. Moreover, the Chrysanthemum is a much hardier plant, and is capable of presenting a bright appearance after a few degrees of frost may have put an end to the Dahlia display for the season. Beside being a good bedding plant for producing massive effects, it has also the invaluable quality of lending itself readily to removal for the purpose of filling gaps in the border in late summer and autumn.

The Chrysanthemum, being generally considered very easy to cultivate, is frequently given too little attention, and in consequence indifferent results are often obtained. In common with all other plants, Chrysanthemums amply repay for good cultivation, and if grown in well-prepared ground in an open, sunny position, free from overhanging trees yet protected from high winds, they can hardly fail to give satisfaction.

The early-flowering section now includes so many excellent varieties rivalling in beauty of form and richness of colour those of the mid-season varieties that every taste can be satisfied, and the choice is often a matter of individual preference.

Many of the older varieties retain their popularity, however, and are still largely grown because of their ease of culture, floriferousness and reliability in almost all localities. Polly is a very floriferous variety producing a mass of lovely, deep orange flowers shaded with amber, and its yellow sport, Golden Polly, and deep bronze sport, Abercorn Beauty, are worthy companions. Diana, which is also amongst the first to flower, is of crimson and gold colour, and with its sports Golden Diana and Crimson Diana, make a particularly useful group.

The members of the Masse group are noted for their free-flowering habit, and most of them are popular favourites, although of somewhat heavy character. Improved Masse, with large, rosy-lilac flowers, is distinct, and produces large blooms; John McAlpine has flowers of an attractive shade of silver and amber, and Horace Martin, of pure yellow; Ralph Curtis, a cream variety; George Bowness, crushed Strawberry; and White Masse, are all worth growing. Nina Blick is an excellent variety amongst the first earlies, its bright red colouring flushed with bronze being particularly attractive.

These varieties are usually in flower in August and amongst those which are at their best in September may be mentioned Mrs. J. Fielding, chestnut-red; Normandie, blush-pink, and Bronze Normandie; Lichfield Pink and Lichfield Purple, both producing large flowers; Dick Barnes, rich crimson; Goacher's Crimson, Bronze Goacher, La Pactole, with large bronzy flowers; September White, one of the best of the white sorts; and Almirante, a remarkably fine variety with scarlet and chestnut flowers which may be disbudded if desired.

Single varieties continue to grow in favour, particularly for room and table decorations, and the range of colours amongst these has been considerably widened in recent years. Morning Star, golden amber; Delice, bright pink; Stanley Baldwin, crimson; Shrapnel, terra

cotta; Dolly Thorpe, salmon-apricot; Vicar of Shirley, bronze; and Simplicity, white, are all excellent varieties. *A. P. C.*

NEW CARNATIONS.

THE following two new Carnations have been registered by the British Carnation Society:—

Apethorpe Citronella, raised by Mr. Charles Garratt, Peterborough; colour, pale yellow.

Lady Daresbury, raised by Messrs. Stuart Low and Co., Bush Hill Park; colour, delicate rosy blush.

The Floral Committee of the National Carnation and Picotee Society (Northern Section) has made the following Awards:—

FIRST-CLASS CERTIFICATE.

Jim Dalton, lavender-mauve self.

AWARDS OF MERIT.

Rosie, deep rose-pink fancy.

Eglinton, Vieux-rose fancy, with red-shaded centre. All three varieties were shown by Messrs. Torrance and Hopkins, Busby, Glasgow.

ORCHID NOTES AND GLEANINGS.

A NEW ODONTOGLOSSUM.

WE have received from Mr. R. Brooman White, of Arddarroch, a very fine flower of an unnamed *Odontoglossum* of unrecorded parentage. The flower in question measures four inches from petal tip to petal tip, and three-and-a-half inches from the top of the dorsal sepal to the tip of one of the lower sepals.

The colour is difficult to describe in a way to convey the beauty of the rounded flower. More than two-thirds of each sepal and petal is of a light orange shade, the tint being produced apparently by a base of soft yellow overlaid with pale pink. There is a narrow, irregular margin of blush pink round each sepal, the dorsal sepal having the most regular marginal band. In the petals the body colour is a trifle paler than in the sepals, and the tips of these organs, and the wide margins are of a pale shade of mauve-pink, while there are a few irregular markings at the base.

The lip, one-and-a-half inch long, is very handsome, and is soft yellow over the greater part, but there are blush-white areas on the "shoulders" and the frilled, broad apex is of a similar tint. The lateral margin of the lip is finely toothed and recurved a little. The labellum suggests a little fairy that has been told to stand in the corner for disobedience, with arms folded behind. There are high blush-white shoulders, the yellow-shaded frock with its blush-white basal frill, the wings of the golden crest, and the crest itself, suggesting a loose and elegant neck-tie. The column (the fairy's neck) and its broad cap (the fairy's head) complete this quaint conceit, so if Mr. Brooman White is hunting for a name for this dainty Orchid, we suggest he gives due consideration to "Arddarroch Fairy."

We may add that in general appearance this beautiful and distinct *Odontoglossum* reminds us somewhat of *O. Armstrongiae*.

SCUTICARIA.

THERE are two species of *Scuticaria* in cultivation, viz., *S. Hadwenii* and *S. Steelii*; the former is easily recognised from the latter by its short, terete leaves and growths, eight to nine inches in length, whilst *S. Steelii* often attains to a length of forty inches or more with stems as thick as an ordinary writing pencil.

S. Hadwenii succeeds in a warm intermediate house, whilst *S. Steelii* enjoys the heat of the warmest division whilst making its growth.

The plants are best grown on rafts, with very little compost about their roots, and the rooting material should be renewed as it becomes decayed.

Both species should be syringed freely during the growing season. The best time to disturb

the plants and afford them new rooting material is when their wiry roots are active.

It is well-known that Orchids with terete, fleshy leaves are much exposed to direct sunlight in their native countries, hence, in glasshouses in this country they should be grown in the lightest position available.

PLATYCLINIS FILIFORMIS.

THE elegant Golden Chain Orchid should be repotted, if this is necessary, after its flowering period is over, and so soon as new roots are seen to be pushing from the partly developed growths. It is not a very robust Orchid, therefore no risks should be taken in potting the plants out of the proper season.

P. filiformis is best grown in shallow pans suspended from the roof, in a shady position in a house having a warm, intermediate temperature. When the roots have grown freely in the new material they may be supplied with water whenever the compost becomes dry, and the plants sprayed overhead frequently all through the growing period as a preventive against red spider.

At almost every exhibition held in August *Platyclinis filiformis* figured in groups of Orchids or other displays and is often seen used in floral designs.

P. glumacea is worth growing for its sweet perfume. *P. Cobbiana* and *P. uncata* require similar treatment to that suggested above. *J. T. B.*

INDOOR PLANTS.

RUELLIA MACRANTHA.

THIS plant is undoubtedly of great value for decorating the greenhouse or conservatory during the winter months. It was introduced from Brazil in 1768, and has been cultivated in most botanic and other gardens of note, ever since, for the beauty of its flowers.

R. macrantha grows about two feet in height, has a bushy habit, and its large, rosy-purple flowers are produced from November to January on terminal and axillary spikes, in such great abundance that the foliage is almost obscured. Fortunately, this plant is not difficult to cultivate. Cuttings should be inserted in a sandy compost in April, and placed in a propagating case over slight bottom-heat. Rooting takes place very rapidly, so that in a few weeks the plants are large enough to be placed in three-inch pots. From these, as they require it, they should be repotted, first into five-inch and finally into seven-inch pots, in which they will flower. A good potting compost consists of two parts loam, one part leaf-mould, and one part well rotted manure, such as is obtained from an old hot-bed.

In the early stages of growth a stove temperature is necessary, but as warm weather approaches the plants should be gradually hardened off, so that by August they may be accommodated in a cold greenhouse, where they will obtain the maximum amount of air and sunlight. They should, however, be returned to the warm house in early autumn.

Given this treatment, *Ruellia macrantha* will produce well-ripened wood, which is essential for the production of flowers.

To ensure a bushy habit it is necessary to pinch the shoots at three different periods, *i.e.*, immediately after the plants have recovered from each potting. After the plants have flowered the soil should be kept on the dry side for a few weeks, after which they should be restarted into active growth. The old plants may be grown on to form large specimens, or the young shoots may be used to form a new batch of plants. *G. F. Gardiner, Botanic Gardens, University of Bristol.*

LACHENALIAS.

THESE South African bulbous plants are very effective grown either in pots, pans or baskets. The egg-shaped, Scilla-like bulbs should be potted during August and September. Five

inch pots are a convenient size, and from six to ten bulbs may be placed in each pot. The tops of the bulbs should be placed about one inch below the surface.

Excellent results may be obtained by the use of good, turfy loam, without manure or sand. Many growers favour a mixture of loam, leaf-mould and a small quantity of well-rotted manure or bone dust.

Although not quite hardy, the plants may be grown well under quite cool conditions. After potting them they may be placed in a frame or on a greenhouse shelf, and the soil kept

BULB GARDEN.

THE NATURALISATION OF BULBS.

NATURALISED bulbous plants, in suitable environment, contribute to the most beautiful of spring-garden effects, and at other seasons of the year it is quite possible, by judiciously selecting and planting bulbous subjects, to bring into the garden something of Nature's delightful harmony.

Narcissi are possibly unrivalled for growing

FIG. 71.—CYPRIPEDIUM HIRÆTHLYN.

R.H.S. Award of Merit, August 16. Flowers white, dotted with purple. Shown by Lady Aberconway and the Hon. H. D. McLaren, Bodnant. (see p. 157).

moderately moist until the leaves are visible. An important point in after cultivation is to keep the plants well supplied with water.

During the winter a minimum temperature of 40° by night and a maximum of 55° by day suits them. Plenty of air should be admitted but cold draughts must be prevented. When growing freely the plants may be fed with weak liquid manure and receive an occasional top-dressing of an approved fertiliser. Feeding may be continued until the foliage begins to fade when the plants may be returned to a sunny frame and kept dry until the following August.

Lachenalias are very attractive when grown in baskets. The baskets should be lined with good, clean moss and the bulbs inserted as the soil is filled in. *C. Ruse.*

in grassland; they are especially beautiful in open parkland, as the flowers sway in harmony with the slightest breeze; in an old orchard they lend their native charm to an already beautiful and very English scene. Daffodils, however, should never be grouped on turf which is mown with a machine, as it is of the utmost importance that the foliage of the bulbs is allowed to ripen thoroughly or decay before it is removed.

September is an ideal month in which to plant the bulbs, and the work may be expeditiously accomplished by the use of a bulb planter or by the homely method of making two cuts with a spade to form a cross, and then by placing the spade under one side to cause the cross-cut to open; if the bulbs are placed within the aperture and the spade withdrawn, the turf resumes its normal position, with the bulbs well covered.

Such well-known varieties of *Narcissi* as *Sir Watkin*, *Golden Spur*, *Emperor*, *Empress*, *Horsfieldii*, *poeticus*, *ornatus* and *princeps* may be naturalised in grass. In a woodland clearing the exquisite little *N. cyclamineus* will freely naturalise to form a dainty picture, and *N. Bulbocodium* will revel in moist soil by a stream-side, where the summer sun will ripen the bulbs.

Tulips are not grown so successfully in grass as *Narcissi*, and a careful selection is necessary. The varieties *Bouton d'Or*, *Gesneriana major*, *Gesneriana lutea*, *T. macrospila*, and the indigenous *T. sylvestris* are suitable.

Two memories of spring bulbs will ever remain with me—a mass of *Crocus Tommasinianus* around the base of a giant Beech tree, and a thickly-set carpet of the Winter Aconite (*Eranthis hyemalis*) beneath the spreading branches of a large Chestnut, the one an azure sea, the other a field of gold.

The Dutch Crocuses naturalise very well if planted in grass of not too coarse growth.

Anemone apennina and *A. blanda* are lovely in thin woodland or in grassland, and if planted in turf, it is well to scythe the grass over early in the year, before the *Anemones* commence to grow.

Those who are familiar with the haunts of our native *Colchicum autumnale* know well the beauty of the rosy flowers as they peep from grass or bracken, and very few bulbs are comparable with this pretty species, or the noble *C. speciosum* for naturalising; they are most effective when planted rather thinly, especially the larger species, for then the great goblets are proud of port and bold of outline. The rosy-crimson flowers of *Cyclamen Coum* are attractive during February and March, sometimes even earlier, and a few corms grouped around the stems of deciduous trees will soon form considerable colonies; a like effect may be obtained in August and September from *C. europaeum*, *C. hederacifolium* and *C. h. album*.

To realise the wonderful beauty of Snowdrops they should be massed boldly in big colonies; the common *Galanthus nivalis* and its double form, also *G. Elwesii*, are the best Snowdrops for planting in woodland and grassland.

Fritillaria Meleagris is beautiful in grass—near to a North Wiltshire village are to be found acres of this quaintly pretty flower growing wild; the old-world *F. Imperialis* will, if undisturbed, also contribute a pretty effect in the wild garden. *Ornithogalum umbellatum* will grow well under trees and is capable of creating pretty effects.

A wealth of other beautiful bulbous subjects includes *Muscari conicum* Heavenly Blue, a splendid subject for grass; such autumn-flowering Crocuses as *C. sativus*, *C. pulchellus* and *C. zonatus*, the winter-flowering *C. Imperati*, and the spring-flowering *C. susianus*; such beautiful *Chionodoxas* as *C. Luciliae*, *C. L. var. gigantea* and *C. L. var. sardensis*; *Leucojum vernum*, *L. v. carpaticum*, and such *Liliums* as *L. pyrenaicum* and *L. tigrinum* for woodland clearings.

Bold massing of these subjects, remote from all formality, and in a purely natural environment, will lend enchantment and bring Nature herself within the garden. *Kiftsgate*.

ARTHROPODIUM CIRRHATUM.

It is interesting to come across an old friend amongst plants occasionally. *Arthropodium cirrhatum* was grown in the old Chiswick Gardens in the early eighties of last century, and now it has turned up again in the gardens of the Royal Horticultural Society at Wisley. It is a Liliaceous plant, allied to *Anthericum* and *Chlorophytum*, having a similar habit of growth, but differs in the filaments having a densely woolly appendage above the middle, which is conspicuous in the open white flowers, nearly an inch in diameter. The appendage is two-lobed at the base, and coiled at the tips of the lobes, after the fashion of a tendril, and this has given rise to the specific name.

The species is the finer of the two that are natives of New Zealand. The plant is also the larger, the flower stem varying from one to three feet in height, and bearing a panicle of flowers, nearly one foot long. It is figured in *The Botanical Magazine*, tab., 2,350. *J. F.*

ALPINE GARDEN.

DELPHINIUM CASHMERIANUM.

BEING of dwarf stature and very attractive in bloom, this species might well be given a place on the rock garden in light, rich soil. A native of the Himalayas, where it is to be found growing at an altitude of from 12,000 to 16,000 feet, it is quite hardy and perennial, and although not long lived is readily raised from seeds, which it produces abundantly.

D. cashmerianum forms clusters of orbicular leaves, about three inches in diameter, and palmately five- or seven-lobed, the lobes being sharply divided and toothed. The leaves are carried on slender petioles up to ten inches in length. The cauline leaves, which are produced sparingly on the semi-erect, one-foot-high flower-stems, are very short-petioled, dark green and three- or five-lobed.

The deep, purplish-blue flowers are produced in corymbs on spreading pedicels, three inches or more in length, along which are several small, lanceolate bractioles. They are about one-and-a-half inch long, the top sepal being elongated at the base into a conical protuberance, half-an-inch or so in length, while the lateral sepals are broadly oblong and downy on both surfaces. The insignificant petals are almost black in colour, the dorsal ones being spurred, while the lateral ones are two-lobed and very hairy. When in blossom, usually during late June and July, this *Delphinium* is highly attractive, so that in the absence of a rock garden it might well be given a place in the front of the herbaceous border. *A. G. F.*

DIANTHUS KNAPPIL.

THE writer recently saw a number of very healthy looking plants of the now rare *Dianthus Knappii*, a plant which he grew many years ago from seeds, and which flowered so profusely that all the plants succumbed without forming shoots suitable for propagation and did not produce seeds. Probably, if some of the plants had been cut down before flowering, "grass" would have been produced, which would have served for propagation. These failings of *D. Knappii*—want of production of shoots and absence of seeds—will account for its rarity nowadays. The many admirers of the genus *Dianthus* should not forget to bear *D. Knappii* in mind for the sake of its clear yellow flowers. This is a colour not at all common among the *Dianthi*. The flowers are borne in close heads, and the plant is not so lanky and tall as some other cluster Pinks for it is only five or six inches high. With the writer, plants from seeds sown under glass in spring were, after being pricked out, planted in a border, which was of light soil, in July; they bloomed well the following year. But for the two defects, already mentioned, *D. Knappii* would be more favoured with growers.

EPIMEDIUM MUSSCHIANUM.

SEVERAL of the *Epimediums*, or Barrenworts, appear to be gradually dropping out of the lists of nurserymen, and are likely to become difficult to procure from the trade.

This betokens a lack of interest in the genus *Epimedium* on the part of garden lovers—a lack undeserved by these pretty plants, which, among other good qualities, will thrive and flower in the shade.

Among the members of the genus which I have looked for in vain in catalogues of several of the leading hardy plant dealers is *E. Musschianum*. It is preferred by some to *E. niveum*, but the plant I have known for many years as *E. Musschianum* is dwarfer than *E. niveum*.

This species is about six inches high, and has the usual delightful foliage of the Barrenworts, with an abundance of clear, white flowers of almost diaphanous texture. Like all other members of the race, it delights in shade, and may even be grown under deciduous trees. If left alone, it will soon spread into generous masses.

This *Epimedium* will grow well in soil containing a good proportion of leaf-mould. It is

charming in spring with its lovely green foliage and white flowers, while in autumn, with suitable weather, the leaves will assume a delightful bronzy hue, and will last a long time for winter decoration. *S. Arnott*.

EPILOBIUM MACROPUS.

ALTHOUGH a native of New Zealand, this Willow Herb is perfectly hardy in this country.

It is a carpeting plant of more than usual merit and should become popular with growers. It has a neat, close habit, bronze foliage and large white flowers rivalling those of *Arenaria montana grandiflora* in both size and colour. It rarely exceeds two inches in height.

This *Epilobium* is not particular as to soil or situation, being quite at home in either the crazy path or the alpine house. Propagation is easily effected by seeds or division. *S. R. D.*

THE LITHOSPERMUMS OF THE PYRENEES.

THERE are three, and even four, interesting *Lithospermum* species on the Pyrenees, which we found lately, during a trip that began at Bayonne and ended at Perpignan. First of all, *L. prostratum* was growing as a weed between the Heathers near Bayonne. Next was the most beautiful of all, the splendid *L. Gastonii*, a Spanish plant which appears here and there on the high cliffs of the central Pyrenees. It grows between 1,400 and 2,000 metres alt., on sunny positions, and always on limestone rocks. It forms big fields of azure which are seen from afar, and are much admired by the inhabitants, who call it "the Blue Flower."

Another beauty is *L. oleoides*, with silver leaves, pink and azure flowers—a marvel when seen in the high and hard limestone rocks it adorns on the Spanish side of the Pyrenees, where it covers large places on half-shady situations. *L. fruticosum* is a little shrub (20-25 cm.) with Rosemary-like, hoary leaves, and deep blue, narrow flowers. This species grows on sunny banks and barren places from Prades to Perpignan, and thence to Aix-en-Provence. *Henry Correvon, Flore, Geneva*.

FLOWER GARDEN.

PENTSTEMONS.

THE colours of the modern florists' Pentstemons are varied and beautiful and they are most useful and popular plants for summer and early autumn effect. They are of easy culture and do well in the majority of deeply cultivated soils, enriched with well decayed animal manure each year. Although not perfectly hardy, the plants will withstand a certain amount of cold weather and may be planted early in April in most districts with safety. From that time onward the beds or borders cannot be hoed too frequently; this operation will assist root action and promote quick, healthy growth.

If exhibition flower spikes are required allow only three or four strong shoots to mature on each plant and feed the roots occasionally with weak liquid manure. The removal of spikes that have finished flowering enables later shoots to gain strength.

Towards the end of September shoots suitable for propagating will be available. Only strong, healthy shoots, without flower buds, should be chosen, unless the stock is small, for propagating from weak growths usually results in poor plants. A cold frame facing south is an excellent place in which to strike the cuttings, in a fairly rich, sandy compost. The frame should be kept close and moist and shaded lightly if necessary until the cuttings show signs of growing, then sufficient air should be admitted to cause the shoots to grow sturdily. If damping occurs at any time plenty of air should be admitted on fine days and the soil dusted with dry sand.

It is a common complaint of growers in some districts that the large-flowered varieties deteriorate after a few years' cultivation; the plants lose their robust habit and healthy cuttings are more difficult to obtain each year.

When this is the case the plants should be given a change of quarters for one season, preferably in the kitchen garden, the flower buds picked off so soon as they appear, and every effort made by good cultivation to help the plants to regain their former vigour. Cuttings from these plants will be plentiful and healthy and a stock raised from them will be available for planting in the borders the following season. S. Bowler, Ford Manor Gardens, Lingfield, Surrey.

HERBACEOUS LOBELIAS.

ALREADY very popular, the herbaceous Lobelias are destined to become even more favoured by growers, and will be a feature of many gardens later. They are a great success in places where moist conditions prevail, for *L. cardinalis* is a true bog plant, and the other species delight in wet or moist soils; they are beautiful when grown in the stream garden, in the bog or in moist, half-shaded positions in the lower part of the rock garden. Although somewhat foreign to their requirements, *L. cardinalis*, *L. fulgens* and the variety Queen Victoria will furnish a summer flower bed in a very telling manner.

In cold districts these Lobelias are not quite hardy, but if the plants are lifted, potted, and placed in a slightly warm house they will pass the winter successfully, or they may be wintered in a cold frame, but I have found a little trouble from them damping in frames, and would recommend the first-named method. Propagation is easily effected by seeds in the case of the species, whilst the hybrid forms may be increased by careful division of the roots in spring. In many favoured places these plants may be treated as hardy subjects, and where this is possible they are an asset to the garden.

L. cardinalis is characterised by green foliage, and has terminal racemes of scarlet flowers, from eighteen inches to two feet in height. The species was introduced from North America so long ago as 1626, and is figured in *Bot. Mag.*, tab. 320.

L. fulgens has attractive bronzy-crimson leaves and terminal racemes of intensely scarlet flowers; the stems are of a reddish colour. Both stems and leaves are slightly downy, and the plant grows about two feet high. It was introduced from Mexico in 1809.

L. syphilitica produces a long, leafy raceme of light blue flowers in late summer and autumn, whereas the foregoing species flower from May to August. The leaves are ovate, acuminate and unequally serrated. The plant ranges from one foot to two feet tall and is hardy in most situations.

L. syphilitica is a North American plant; it was introduced in 1665, and was originally known as *L. glandulosa*.

L. splendens is a very close ally of *L. cardinalis* and *L. fulgens*, which it resembles both in colour and habit. It is a Mexican species and was introduced in 1814.

L. pyramidalis, from Nepal, produces violet flowers in a panicle, leafy raceme; the stem is pyramidally branched, the leaves lanceolate, acuminate and serrated. It grows about three feet high. This species is fairly hardy; it was introduced in 1882, and is figured in *Bot. Mag.*, t. 2,387.

Other little-known hardy or half-hardy species include *L. amoena*, with pale blue flowers, introduced from North America in 1812; *L. polyphylla*, deep purple, introduced from Chili in 1835; *L. puberula*, blue and white, a native of North America; and *L. glandulosa*, blue, introduced from the southern United States in 1840.

During recent years many hybrid forms have appeared, and the species and hybrids together constitute some of the most interesting and certainly some of the most intensely brilliant-coloured plants.

Queen Victoria is an old and deservedly popular form of *L. fulgens*; a selection of modern varieties includes B. Ladhams, vivid crimson; Vesuvius, scarlet; rosea; Rifleman, brilliant scarlet; Purple King; Mrs. Humbert, pink; carmineus; Purple Emperor; Huntsman, red; Firefly; Gloire de St. Anne's and Shirley Beauty.

Syphilitica alba is a white form of the species and should be included in a collection.

These plants, with their very brilliant flowers, are most effective when placed in close proximity to Ferns and similar plants, the fresh green of the one presenting a vivid contrast to the kaleidoscopic colouring of the other. E.

HARDY FLOWER BORDER.

POTERIUM OBTUSUM.

A NATIVE of Japan, this rather uncommon Burnet (Fig. 72) is a fine summer-flowering subject for the herbaceous border, being of attractive and

FIG. 72.—POTERIUM OBTUSUM.

vigorous habit and very beautiful when in bloom. Forming a bushy plant about three feet in height, it produces numerous pinnate, basal leaves, up to about eighteen inches in length, consisting of six or more pairs of rounded, oblong leaflets which are short-petioled and have regularly toothed margins. The flower stems are erectly-branched, the branches arising from the axils of the leaves, the bases of which are sheathed and furnished with two leaflet-like stipules. The leaves themselves are much smaller than the radical ones, consisting of four or fewer pairs of leaflets, the upper surfaces of which are rich green, while the under ones are much paler. The flowers are produced in nodding, semi-pendulous spikes about three inches long and an inch in diameter, their attractiveness being due to the masses of rich, rose-red stamens, the remaining parts of the flowers being insignificant. A. G. F.

PUBLIC PARKS AND GARDENS.

THE Sub-Committee of Glasgow Corporation has selected the following "short list" out of ninety-four applications received in connection with the appointment of Assistant Director of Parks:—Mr. James W. Atkinson, Chief Assistant Parks Department, Blackpool; Mr. W. J. Hepburn, Superintendent, Greenwich Park; Mr. W. Lambton, general foreman, John Innes Horticultural Institute, Merton; Mr. Leslie Morgan, General Assistant of Parks, Manchester; Mr. George E. Roden, Superintendent of Parks, Folkestone; and Mr. W. A.

Watson, Assistant Superintendent, Roe Lee Park, Blackburn. When the recommendations came before the Parks Committee, a motion to refer the list back to the special committee in order that four additional applicants from the staff of the Corporations Parks Department be included, was defeated by ten votes to seven.

CHURCH Stretton Urban District Council has decided to accept the offer of Mr. Samuel Brewis, of Tiger Hall, to present to the Council about thirty-five acres of Spring Bank Farm as an open space for the public for all time.

THE Warblington Urban District Council has under consideration the question of carrying out the further development of the recreation ground at Emsworth at an estimated cost of between £200 and £250.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc. but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

a warm corner for the sake of its bright yellow flowers in autumn.

A very charming foliage plant is *Artemisia arborescens*, with finely-divided leaves of silvery-grey. A rather pretty effect is seen in front of the long range of conservatories here at present, where a clump of a strong-growing variety of *Agapanthus umbellatus* has pushed

The two fine, sub-shrubby Poppyworts, *Romneya Coulteri* and *R. trichocalyx*, are in good condition now, bearing abundant large, white flowers. Although inclined to be invasive when well established, a place can usually be found for them where they cannot overwhelm less vigorous plants. It is somewhat remarkable considering the abnormally cold weather ex-

FIG. 73.—CARDUUS EUOSMUS.

NOTES FROM GLASNEVIN.

THE advent of August brings a very definite feeling of autumn, and a corresponding change in the look of the garden. Already autumn tints are making their appearance, *Berberis Thunbergii* is crimson, and certain fruits are becoming prominent, though not yet highly coloured. Shrubs in flower are not numerous, but conspicuous on sunny walls is *Pentstemon cordifolius*, a truly charming plant, apparently quite hardy where well exposed to the sun. *Hypericums* are extremely useful at this season, the best of them including *H. patulum*, *H. p. Henryi* and *H. Hookerianum Leschenaultii*; the last distinct from all others in its long, strong shoots bearing glaucous leaves and very

its umbels of blue flowers up behind the *Artemisia*, the blue and silver making a beautiful combination. Near-by, a clump of *Phygelius capensis coccineus* is flowering freely, a great improvement on the older form, and a charming display is made by *Lobelia laxiflora (Cavanillesii)*, with brilliant red and yellow flowers; its roots are growing between the stones of the conservatory where they are protected from frost in winter.

Many fine shrubby *Veronicas* are flowering now, but their specific identity is uncertain, they are of the *speciosa* type, including the red-flowered varieties, *Gauntlettii* and *La Seduisante*, the deep blue-flowered *Veitchii*, and several others of the same habit, but with

perienched up to the end of June how well Californian plants have flowered. Never have we had a finer display of flowers on *Fremontia californica* and *Carpenteria californica* that during the last month. Of the latter there are two distinct forms here, one with narrow leaves and small flowers, the other with shorter, thicker, dark green leaves, and large pure white flowers. I was inclined to think the narrow-leaved form the freer-flowering, but this year I could find no difference in that respect.

Herbaceous plants have developed apace during the last few weeks, and nowhere are they finer than in the moist ground near the pond and river. Very conspicuous are several species of

FIG. 74.—DUDLEYA PULVERULENTA.

large, rich yellow flowers. It must be propagated from cuttings as seedlings revert to a green-leaved form with smaller flowers. There is some doubt about the true identity of this shrub and it is at present being investigated. *Hypericum chinense* is conspicuous in a sunny border sheltered by a greenhouse, and although not as hardy as many other species, it is well worth

flowers of mauve or pale blue, making an interesting and beautiful series, not, however, to be relied on as quite hardy. Hardier and flowering freely is *V. angustifolia*, with narrow, linear leaves and numerous racemes of white flowers; this is a handsome shrub of which there are examples five feet to six feet high and as much through in this neighbourhood.

Senecio, notably *S. Veitchianus* and *S. Wilsonianus*, with tall spikes of golden-yellow flower heads; *S. stenocephalus*, with slender spikes of smaller heads; and *S. clivorum*, with corymbs of deep yellow heads. The tall, spicate species are remarkably effective, standing well up among other vegetation. Here, too, *Thalictrum Delavayi* thrives, the tall sprays of violet-coloured

flowers standing well above the Fern-like foliage. Astilbes continue to make a good display, flourishing in the rich, moist soil, and varying considerably in colour and time of flowering; among the most attractive are the hybrids of *Astilbe simplicifolia*, intermediate in height and bearing numerous panicles of pink flowers.

The rock garden still shows a fair amount of colour, the more striking groups being *Platycodon grandiflorum*, in pale and deep blue, and various species of *Oenothera*, particularly *O. caespitosa*, with white flowers, *O. missouriensis*, yellow, and a remarkably handsome plant acquired from Mr. Carl Purdy as "Burbank's America," which has large flowers opening pure white and fading to pink, stems sprawling and bearing very finely divided leaves. This, probably a hybrid of *O. acaulis*, is quite a striking plant, continuing to bloom for several weeks, many flowers remaining open during the day.

Carduus euosmus (Fig. 73), a Chinese, stemless Thistle, described in *Notes from the Edinburgh Botanic Garden*, 1917, p. 17, is of more than passing interest. The leaves form a rosette and are dark green above, white tomentose below, pinnatifid, with spinous margins. The yellow flower heads are produced in the centre of the rosette, one large central one surrounded by seven to eight slightly smaller heads. The involucre bracts are narrowly lanceolate, with long, sharp, stiff points; it is an interesting and remarkable plant. J. W. Besant.

Dudleya pulverulenta (Fig. 74) is striking, forming a large rosette of thick, glaucous leaves, after the manner of the *Cotyledons*. It has lived in the rock garden for five or six years with no protection other than a sheet of glass over it in winter. This year, for the first time, it has produced three long flower stems from the axils of the lower leaves; each stem is thickly furnished with fleshy leaves, and is terminated by a racemose panicle of comparatively large flowers of a dull, glaucous hue, the segments of the corolla tinged with dull red. This plant comes near to *Cotyledon pulverulenta* of Saunders' *Refugium Botanicum*, t. 66, but differs from that figure in the more abruptly acuminate basal leaves, the less acuminate stem leaves, and in the colour of the corolla.

NOTES FROM WISLEY.

In many gardens Gladioli are merely planted in small groups with the object of brightening the herbaceous border at a rather awkward time, and it is seldom that one sees a whole bed or border entirely devoted to these striking flowers. A good idea of their effectiveness in a mass, however, can be obtained from the trial of Gladioli at Wisley, which is now almost at its best, and which contains both large-flowered and primulinus varieties. The majority of the latter are classed as *primulinus grandiflorus*, and it would appear that the grace which has hitherto characterised the *primulinus* type is being lost in the pursuit of large blooms.

One of the most handsome of these which belong to the large-flowered section is *Albatross*, with large, white blooms. Good spikes are also to be seen in the case of *White Giant* and *L'Immaculée*. *Thomas Edison* is a showy variety with salmon flowers, while *Taro* is no less conspicuous with its white-throated blooms of bright carmine. Attractive, yellow-flowered Gladioli are *Cecilia* and *Golden Measure*, the latter being later flowering than any of the foregoing varieties.

In the *primulinus grandiflorus* section, *Ethelyn* stands out by reason of its particularly tall, slender, arching spikes, which are yellow, suffused with apricot, while among those of stockier habit, *Alice Tiplady*, with handsome, orange-salmon flowers, is well worthy of note.

In addition to Gladioli, large numbers of herbaceous Phloxes are now in full bloom in the new flower-trial quarters, and varieties such as *Gen. von. Heutz*, *September Glow*, *Splendour*, and the white-flowered *Phyllis*, are a few of the many which are blooming well.

Dahlias are now beginning to attract attention, and many of the single, Mignon sorts are already covered with bloom. One of the best is the yellow-flowered H. J. Jones, which is in flower with *Pembroke*, another free-flowering Mignon. The flowers of the latter, however, are much paler, and show a faint rim of red around the petals. *Histon Gem*, scarlet, and *Paisley Gem*, with orange-scarlet flowers, are also making a bright show, and a free-flowering crimson Mignon is seen in *Ruby*. Rather similar but with larger and fewer flowers is *Coltness Purple*.

Many of the Roses in the Rose border are now producing their second crop, one of the most forward being *Betty Uprichard*, a Rose which has flowered remarkably well this year at Wisley. One's enjoyment of the Roses, however, is somewhat spoiled by the unpleasant smell of sulphur with which the plants have been treated in order to check mildew.

In the rock garden *Gentiana lagodechiana*

White Lake. Included among these are numbers of plants of *Eritrichium nanum*, and one of the largest has been planted out in the rock garden under the shelter of a rock, where it is hoped that it may flourish. Both this and the remainder, which are in pots in the alpine house and frames, seem to have survived the journey well, and both look extremely healthy. Some good forms of *Androsace glacialis* which grows among the *Eritrichium*, were also brought back, and plants of *Primula pedemontana* were collected from the *Primula* rock frequently mentioned by the late Reginald Farrer in his books on alpine. Other plants which have been collected by Mr. Harris include some exceptionally fine forms of the white-flowered *Ranunculus pyrenaicus*, plants of *Saxifraga oppositifolia*, with particularly large and deep red flowers, in addition to specimens of *Saxifraga caesia*, *S. diapiensoides*, *S. valdensis*, *S. androsacea*, *Campanula cenisia*, *C. Allionii*, *Viola cenisia*,

FIG. 75.—PRIMULA LITTONIANA AT WISLEY.

s blooming remarkably well, and a few blooms are showing on *Gentiana Farreri*. The latter, however, does not seem to do nearly as well at Wisley as *G. sino-ornata*, which has made excellent growth and promises to make a fine display in the autumn. A new *Gentian* which appears to have a vigorous constitution is one collected by Captain Kingdon Ward (K.W. 5840). It is just coming into bloom and somewhat resembles *G. Purdomii*. Other interesting plants in flower in the rock garden include *Eryngium prostratum*, a most attractive dwarf Sea Holly, and *Primula Littoniana* (Fig. 75), which commenced to bloom six weeks ago, and of which there is a group of more than a hundred plants. The heavy showers so frequently experienced of late have spoiled the flowers of many rock plants, but the after effect of rain drops which are caught in the foliage of silver-leaved subjects such as *Artemisia lanata pedemontana*, *A. maritima* and *Anthemiscinerea* is most attractive when the sun comes out.

Mr. Harris, who has charge of the rock garden at Wisley, has recently returned from a trip to Mt. Cenis, and has brought back with him many alpine plants collected there and around the

Pyrola rotundifolia and *Azalea procumbens* which he found in considerable quantity.

Plants in flower in the alpine house include *Campanula Zoysii*, with its curiously shaped corolla; the semi-double *Campanula haydougensis*; the British Sea Heath (*Frankenia laevis*) and the Bog Pimpernel (*Anagallis tenella*), another British plant which may be found growing near the Wisley Hut pond. In addition to these, the tiny, yellow, composite flowers are now visible on the grey mats of *Raoulia australis* and of an even dwarfer species from Waroo. An uncommon plant in bloom is *Wahlenbergia vincaeflora*, whose flowers are white, save for a thin blue line on each petal, while another rarity is the Macedonian (?) *Jankaea* (*Ramondia*) *Helldreichii*, of which plants have lately been sent in.

Among the shrubs, the beautiful *Eucryphia pinnatifolia* is in bloom, and there is an excellent show of *Ericas* in the Heath garden. Signs of autumn are apparent in the yellowing of the foliage and in the colouring of the fruits of berryed shrubs, among which *Berberis Lycium* is a good example, while numbers of white berries are visible on the Pearl-fruit of *Peru Margyricarpus setosus*. J. E. Grant White.

TIBETAN PRIMULAS OF THE SIKKIMENSIS SECTION.

THE numerous species of 'Sikkimensis' Primulas collected in Tibet in 1924 are still a source of confusion to growers, though now that they have all flowered for the second year it should not be difficult to distinguish them. There is practically nothing to add to or retract from what was stated, two years ago, by Professor Wright Smith, whose careful analysis in the laboratory has fully justified itself in the garden; it may, however, be possible to separate the species and varieties more fully for garden purposes than has been possible hitherto, while at least one more species has to be recognised as present in the collection.

It may be noted that all 'Sikkimensis' Primulas, if classified according to foliage, fall into one of three groups: (i) those which have rounded leaves, with heart-shaped base, borne on distinct petioles, usually much longer than the length of the blade, e.g., *P. Florindae*, *P. firmipes* (Fig. 76); (ii) those which have oval leaves borne on long, distinct petioles; the upper surface is more or less rugose, and the margin finely toothed, e.g., *P. microdonta*, and its varieties (Fig. 77); (iii) those which have a ribbon-shaped blade, narrow oval or linear oval, tapering gradually to a longer or shorter, but quite definite stalk; the apex may be rounded or pointed, the upper surface is not rugose, but the veins are usually sunk, e.g., *P. sikkimensis*, *P. Waltonii*, *P. prionotes*, *P. reticulata* (Fig. 78).

As regards the flowers, these are usually open, bell-shaped, with narrower tube and spreading limb, more or less powdered inside with meal, usually fragrant, and usually pendent on moderately long pedicels; sometimes rather upright, especially if crowded; in one or two, more rarely three, or even four, whorls.

The species are as follow:—*P. microdonta*, var. *alpicola*, 'Moonlight' (K.W. 5746). Leaf of type (Fig. 77, left). Flowers sulphur, with open bell, the inner surface lightly and evenly powdered with white meal, very fragrant; usually in one whorl, sometimes two; crowded, tending to stand erect. Height two feet. Flowers June. Award of Merit, 1927. A finely grown plant was exhibited by Messrs. Oliver and Hunter at Chelsea in 1927, and it was whispered behind its back that it was really an illegitimate child of *P. Florindae*. There is nothing in the rumour.

P. Florindae, 'Giant Cowslip' (K.W. 5781). Leaf of type (Fig. 76, left). Flowers bright, cadmium yellow, evenly powdered with white meal, rather narrow, very fragrant, borne in an immense terminal mop, pendent at first, later almost erect. Height, three to four feet. Flowers in July. Award of Merit, 1926.

There is no possibility of confusing this species with any other, the leaves alone being sufficient to distinguish it at a glance, so I need write no more about it. Those who profess to see in it "only a coarse edition of *P. sikkimensis*" should consult an oculist without delay.

P. microdonta var. *alpicola*, forma *violacea*, etc., 'Joseph's Sikkimensis' (K.W. 5818). This is the plant, or, at any rate, the number, which has given rise to some confusion. The seeds from which it was raised were collected in four different localities,* and included forms with white, buff, purple, claret and violet flowers. The best known form under this number is *P. microdonta alpicola violacea*; it will probably become known in gardens as *P. violacea*, and the purple and claret forms are likely to be included with it. White forms have been taken out and placed with true *P. microdonta* (K.W. 6117), which is what they are, in an alpine form. Buff forms are an alpine variety of 'Moonlight.' Thus K.W. 5818 by this time stands simply for *P. violacea*, violet or purple.

Leaf of type (Fig. 77, left). Corolla large, the limb flat when fully open, a condition not seen in any other species of the section. Flower heads very large, at first pendent, later erect owing to

overcrowding, in one, sometimes two whorls. The expanded bell has a sharply defined band of white powder thickly laid on as with a paint brush round the base inside, and is very fragrant. Height, one-and-a-half to two feet. Flowers in June.

By general consent the second most beautiful species of the *microdonta* group. A peculiarity

hence the confusion. It is certainly very little removed from true *P. sikkimensis* itself, though it behaves rather differently in the garden. It is a much more robust plant than true *P. sikkimensis*, and it flowers later. This same species has also come to light under K.W. 6117. Two years ago, I stated that *P. sikkimensis* is apparently absent from Tibet, but

FIG. 76.—TYPES OF PRIMULA LEAVES.
Left, *P. Florindae*; right, *P. firmipes*.

is that some of the plants, at least, open with purple flowers, which later turn violet, so that both purple and violet flowers may be seen on the same plant at the same time. The various colours apparently breed true, if given a chance. (See below).

Under this same number at least one quite distinct, buff-flowered species has come up;

this now requires some modification; for the present, at least, it will be convenient to regard the yellow-flowered rogue (Fig. D. 78) raised from seed under K.W. 5818 and 6117, as *P. sikkimensis*. It is not 'Moonlight,' i.e., *P. microdonta alpicola*, buff form (K.W. 5746).

Thus two buff, or yellow, Primulas have come up under K.W. 5818. One of them is not a

* Nyima La, both north and south of the pass; Nam La; Doshong La. All three passes are within twenty-five miles of each other, near the gorge of the Tsangpo in Tibet, about 150 miles east of Lhasa.

'microdonta' at all, but it may be *P. sikkimensis*. The other is a 'microdonta,' and is probably 'Moonlight,' though it is important to note that 'Moonlight' was growing entirely by itself, and seed under K.W. 5746 is of this plant, and nothing else; whereas the buff forms found in the mixed seed, K.W. 5818, were growing mixed, *i.e.*, with purples, violets and whites. Similarly, are the whites of this mixed bag *P. microdonta* itself (K.W. 6117), or are they the alpine variety of *P. microdonta*? Probably it is impossible to say for certain, because growers have naturally segregated the colours by this time, without distinction of number; nor does it greatly signify. Anyhow, that is the true story, and explains how these mixed colours got here.

P. pudibunda (K.W. 5906). A dwarf plant with fragrant Primrose-yellow flowers, and leaves as in Fig. 78. Height six inches. Flowers in June. Professor Wright Smith tells me that *P. sikkimensis* becomes dwarfed at high altitudes in Sikkim, and that extreme forms are called *P. pudibunda*. It appears to come true from seed.

Closely allied, yet distinct, is another dwarf yellow, *P. sp.* K.W. 5939. No seed of this was collected separately, but it was probably collected mixed with seed of *P. pudibunda*. The two plants are much alike, and being difficult to distinguish in flower, are impossible to separate in fruit.

P. Waltonii, 'Ruby' (K.W. 6094). Leaf as in Fig. 78 (B), broader at the apex than in the middle. Flowers glossy port-wine-red, lightly and evenly powdered with meal on the inside; drooping, very fragrant. Easily distinguished from purple-coloured specimens of *P. microdonta alpicola* by its leaves, and by its more bell-shaped corolla which lacks the regular band of meal. Height one-and-a-half to two feet; flowers in June. *P. Waltonii* is very different from the purple-flowered Chinese 'Sikkimensis,' *P. secundiflora*. Its flowers are half as large again, of a much richer colour, and more numerous; nor do they take on the raw-meat tint of *P. secundiflora* as it fades. The calyx, too, is quite a different shape and lacks the stripes of white meal which are so conspicuous against the purple-black calyx of *P. secundiflora*. 'Ruby' is one of the finest *Primulas* collected.

P. microdonta (K.W. 6117). Leaf as in Fig. 77 (left). Flowers ivory white, with a sharply defined band of cream meal round the inside, as in 5818. Fragrant. This is regarded by Professor Wright Smith as coming nearest to Franchet's original type from Yunnan. It resembles 5746 and 5818 in foliage and in flower, particularly in the tendency for the flowers to stand upright; it differs from both in flowering about a fortnight later, and in producing several tiers of flowers—always two, often three, sometimes even four in nature. Cultivated plants are as yet not sufficiently robust to flower so freely. Height, three feet; flowers in July. Perhaps the finest of the *microdonta*s, and even of the entire collection.

A word of warning here; the very distinct leaves of *P. microdonta* and its varieties are beloved of slugs—far more so than those of other sorts.

The buff-flowered species already referred to as *P. sikkimensis*, which has appeared under K.W. 5818, has also come up under this number; at the time the seed was collected, the plant was supposed to be one of the many colour forms of *P. microdonta alpicola*.

P. prionotes (K.W. 6430). Leaf as in Fig. 78 (c). This species has smaller flowers than any of the others, the tube being narrow and the limb little expanded. There is a heavy coat of meal on the interior, leaving only the tips of the lobes and a small eye at the extreme base of the tube, to show the chocolate or plum-colour of the flower. Truss always drooping, never turning erect as in the 'microdonta' group. The poorest of the lot, as regards size and colour of flower, but yet in sunshine, with the light glancing through it, quite a handsome species, and a fine doer. Probably a useful plant for putting a little warm blood into the anaemic group. Height, one foot, flowers in June, rather later than *P. microdonta* and its allies.

Professor Wright Smith points out that *P. prionotes* and *P. Waltonii* are closely allied, despite appearances to the contrary. Both have the pinkish eye at the base of the tube, seen in none of the other species. But *P. prionotes* is much more mealy than *P. Waltonii*.

All the species enumerated above, except *P. Florindae*, require a rich, rather heavy soil, and plenty of root-run. Most of them prefer shade, but it must be remembered that in the

in the stream bed, in order to attain their full stature of four feet or more, with leaves like a Dock. Plants grown in open sunny situations, or in dry soil, are small and wizened.

All members of the 'microdonta' section grow magnificently in the woodland, amongst *Rhododendrons*, and they should be grown in masses, as is so successfully done at the Edinburgh Botanic Garden. Under these circumstances the colour forms may be expected to

FIG. 77.—TYPES OF PRIMULA LEAVES.
Left, *P. microdonta*; right, *P. microdonta* var. *alpicola*.

damp regions where they grow best, as, for instance, the west of Scotland, sunshine is not on the menu, and they can be grown in the open without fear of reprisals. For *P. Florindae*, however, shade is essential, and so is water; in fact, it should be grown in water, preferably running, or on slopes down which water is oozing or trickling. Unfortunately, in Britain, our streams are usually low in summer and in spate during the winter, instead of high in summer and dry in winter, as in Tibet; and there is a danger of them being washed out in the winter, if grown in running streams. But if the flow can be regulated, they should be grown

come true from seed. In Tibet, 'Moonlight' (*P. microdonta alpicola*; buff flowers) grew by itself in vast sheets in the open meadow. Where the ground became very boggy, it was entirely replaced by the very different *P. tibetica*, and where very dry and well-drained (the soil being gravelly) by *P. atrodentata*. The only other 'sikkimensis' *Primula* anywhere near was *P. Florindae*, which replaced 'Moonlight' under the trees where streams were flowing, or on heavily shaded bog slides. *P. microdonta violacea* also had an alpine meadow to itself, at a rather higher altitude.

P. microdonta true (the three-tiered white

pagoda) grew under the bushes in a drier valley, and also kept pretty much to itself, though *P. Florindae* was found here, too, in suitable localities, and there were a few coloured 'alpicolas.'

P. pudibunda has the high alpine trickles—at 14,000 to 15,000 feet—to itself.

Finally, in certain woodland meadows,

mensis 'Primulas usually come true from seed; the coloured 'alpicolas' alone are doubtful. The inference is that so long as we grow them in generous clumps in this country, and give the bees a chance, they will come true here also.

But hybridisation is not to be despised, and one can imagine some wonderfully coloured

mony is propinquity; plant a batch of colour varieties closely together, and you cannot tell what the answer will be.

Finally, it may be stated once more that of the above-mentioned species, *P. microdonta alpicola* (all forms), *P. microdonta* true, *P. Florindae*, *P. pudibunda* and *P. Waltonii* come from the valley of the Tsangpo and its lower tributaries

FIG. 78.—TYPES OF PRIMULA LEAVES.

A: *P. sikkimensis*; B: *P. Waltonii*; C: *P. prionotes*; D: *P. sp. § sikkimensis* (rogue with K.W. 5818, 6117).

the coloured 'alpicolas'—buff, white, purple and violet, occurred together in panchromatic confusion.

In Szechuan I have seen *P. sikkimensis* and *P. secundiflora* growing together in profusion, yellow streaked with crimson, without the hint of a cross. It is clear that in Tibet, at any rate, where there is a distinct tendency towards segregation in countless thousands, with overlapping only at the edges, the Tibetan 'Sikki-

P. Florindae, like an oriental mop. But it must not be forgotten that hitherto all attempts to cross a purple-flowered 'sikkimensis,' such as *P. secundiflora*, with a yellow-flowered one, such as *P. sikkimensis* itself, have failed, and it remains to be seen what the new battalions will do. So far as the coloured 'alpicolas' are concerned, at any rate, it seems very probable that all that is required to break down their caste distinctions and promote wanton matri-

150 miles due east of Lhasa, in the heart of inhabited Tibet, and not from Western China, as the labels at Kew misinform us. *P. prionotes* comes from Gyantse, half way between Lhasa and the Indian frontier, by the main road, and I believe it is found also near Lhasa; the explanation of its presence around cities on the barren plateau at 13,000 to 14,000 feet being that it is a plant of the irrigation channels and small watercourses. *F. Kingdon Ward.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

See Tables and Summaries, Ante. pp. 131-137).

(Continued from p. 153.)

ENGLAND, N.E.

NORTHUMBERLAND.—The fruit season is the worst on record, for the crops were ruined by cold, sunless weather and sharp frosts in May and early June. As we are only two hundred feet above sea level, we suffered more from late frosts than gardens in higher elevations. The fruit blossom was badly injured before it had opened, with disastrous results. *James Winder, Howden Dene Gardens, Corbridge-on-Tyne.*

YORKSHIRE.—Owing to the late frosts and cold winds, the fruit crops in this neighbourhood are very backward. With the exception of Pears, the yields are good. Black Currants, Strawberries, Red Currants and Raspberries are all splendid crops. Our soil is on the light side and rests on chalk. The gardens are about ninety feet above sea level. *John Turton, Sowerby House Gardens, Bridlington.*

—Some of my Apple trees are carrying crops this year which may be described as in excess of the average. These are Irish Peach, Lady Sudeley, James Grieve and Rev. W. Wilks. The first-named is an early-flowering variety, and the blossoms were expanded when three sharp frosts occurred in April, that on the 30th registering 6°. The tree was in full bloom on April 21. All the other trees named did not flower until early in May, and to some extent escaped damage by frost. Of small fruits, Black Currants and Gooseberries are excellent, though late in ripening owing to the cold, wet weather of June. Loganberries and Raspberries are fruiting very well indeed. *W. H. Bolton, 8, Ash Grove, Beverley Road, Hull.*

—Our crops of Apples, Pears and Plums are the smallest we have had for some years; in each case, however, the fruits that have set are of good quality. Small fruits are abundant, and Strawberries, although a few of the earliest flowers were destroyed by frost, are a good average crop. The trees and bushes in all cases carried plenty of blossom, and I attribute the failure to the very severe frosts we experienced during the last week of April, reaching the maximum severity on the 30th with 10°. Small fruits, however, were not in a forward enough condition at that date, to take any harm. The soil at Dalton is a medium loam resting on clay, with a base of chalk. *J. S. Coates, Dalton Hall Gardens, Beverley.*

—The Apple, Pear and Plum crops were spoilt by late frosts and high winds, except in sheltered places. Plums are a complete failure. Small fruits showed good promise, but a long period of dry weather somewhat spoilt them. *James E. Hathaway, Baldersby Gardens, Thirsk.*

—At the time of writing, Apples and Pears are not much bigger than Peas. Small fruits are very fair, Gooseberries very good, and Strawberries a moderate crop. Currant bushes are carrying heavy crops, and all fruit bushes are very clean, which is not usual in this district. *Alfred Dryden, Field House Gardens, Triangle, Halifax.*

—Late frosts spoilt the fruit crops. Isolated trees of Bramley's Seedling, James Grieve and local sorts are the only Apples to crop this year. Gooseberries are a heavy yield and cleaner than usual. Strawberries were a small crop and soon over, owing to cold, wet nights prevailing when the bushes were in bloom. *J. G. Wilson, New Millerdam, Wakefield.*

ENGLAND, E.

ESSEX.—The fruit crops are, on the whole, satisfactory. Apples, generally, are a good crop, as also are Pears. Plums are a complete failure, the blossom having caught the frost badly. Peaches and Nectarines are average crops; Gooseberries, Black Currants and Raspberries were abundant, but Red Currants are very

scarce. I am watching Strawberries planted in the early autumn of 1926 and in February of this year with interest. At the moment they look promising, with a few exceptions. *Arthur Bullock, Copped Hall Gardens, Epping.*

—There was a splendid show of blossom on most of the fruit trees here, and the outlook for a good fruit crop looked very promising till frost destroyed a great many Pears and Plums, but left average crops. Apples fared better, as they were late coming into blossom. The frost destroyed quite one half of the Strawberry and Raspberry crops. All the fruit trees about here are very clean this year; no doubt the late frosts had something to do with this. *Charles A. Heath, Morleys, Great Hallingbury, Bishop Stortford.*

—There is an abundance of Apples, Pears and Raspberries, and the quality is excellent. Strawberries suffered badly owing to the continual rains in the winter and spring, many plants decayed, and what bloom the remainder bore was destroyed by frost. Peaches and Nectarines also suffered injury from late frosts and hailstorms. *W. T. Franklin, Little Laver Hall Gardens, Harlow.*

—The promise of most bounteous fruit crop was spoilt by frosts on April 27 and the four following nights, when 13°, 11°, 11°, 12° were registered. The frosts were followed by very hot weather. All the early varieties of Apples were spoilt, also Pears, only a few of the late Apples escaping injury, such as Bramley's Seedling, Lane's Prince Albert, Lady Henniker and a few Cox's Orange Pippin. Our soil is of medium texture overlying gravel. *John Dewhurst, Gilston Park Gardens, Harlow.*

—Much injury was caused to fruit blossom by late April frosts, particularly to Pears, Plums and Strawberries, but many Apples escaped injury. The soil is heavy generally. The best dessert fruits are produced from the lighter soils. *C. Wakely, East Anglian Institute, Chelmsford.*

(To be continued.)

FRUIT GARDEN.

GOOSEBERRIES.

GOOSEBERRIES rarely receive a full share of appreciation; nevertheless, it is incumbent upon the gardener to select, when planting, varieties of high quality and such as will cover as long a season as possible. Gooseberry varieties are seldom chosen with the same care that is bestowed upon, for instance, Apples or Pears, and yet amongst Gooseberries there is a wonderful range of flavours, consequently discrimination is necessary when selecting varieties to plant. The Gooseberry thrives in any good garden soil of moist character, and reaches perfection in a rich loam improved by the addition of rotted manure; young plants should be placed six feet apart, and the "triangle" method of spacing adopted, thus using the available space to the best advantage. An open position should be chosen. An important item of cultivation is to fork the beds or plantations lightly each autumn and to apply a generous dressing of well-rotted manure.

Pruning demands some care in the early stages of growth, the objective being shapely bushes capable of bearing fruits of first-rate quality; each bush should have a clear stem of six or seven inches to admit of the soil being "worked" underneath, for if the branches are allowed to develop in closer proximity to the soil surface, the resulting fruits will become sullied and quite unfit for use.

During the first year after planting from the cutting bed the shoots should be shortened to three or four eyes each; the following summer two new breaks should be secured from each shoot and the laterals stopped to form spurs, while during the following winter the main shoots should be shortened to about one foot, these again being allowed, in due course, to retain

two or three shoots each. This treatment results in well-formed bushes and the subsequent pruning should mainly consist in cutting back the lateral shoots and the maintenance of an open centre. Henceforth, the leading shoots need very little restriction beyond an occasional necessary shortening; undue "stunting" can only result in small crops of fruits of poor quality.

Old, worn-out shoots should be removed in winter, or directly after the fruits have been gathered, retaining, in established trees, sufficient strong, young growths with which to replace the discarded branches.

Fan-trained trees or single, double or triple cordons are excellent for planting against a north wall. Cordon plants trained on a trellis are suitable for growing in the open and are especially attractive as a background to narrow flower borders. Gooseberries may also be trained successfully on cylindrical or vase-shaped wire supports, and it is worth noting that the berries obtained from trained specimens are invariably of fine quality.

In addition to those in the open it is desirable to form a plantation of Gooseberries on a north border, thus securing a supply of fruits late in the season. From the variety Red Warrington, so placed, I have gathered excellent berries in November.

The propagation of the Gooseberry is easily effected from cuttings inserted in the autumn; well-ripened shoots should be chosen and removed at their junction with the older wood. If plants with stems are needed the eyes should be carefully removed from the lower half and the top shortened to admit of each cutting being about one foot in length; the prepared cuttings may be inserted rather thickly in trenches four inches or five inches in depth and one foot asunder, and they should be made very firm by treading. An open position in the garden should be chosen for the cutting-bed.

The following is a careful selection of varieties, chosen with a view to the longest possible extension of the season during which Gooseberries are available:—

Red.—Whinham's Industry, Warrington (an indispensable variety), Red Champagne, Speedwell, Crown Bob, Ironmonger and Rifleman.

Yellow.—Early Sulphur, Golden Gem, Langley Beauty, Leveller, Leader, Rambullion and Catherina.

White.—Whitesmith, Mitre, Transparent and Careless.

Green.—Bright Venus, Howard's Lancer, Keepsake, Langley Gage, Green Ocean and Rosebery.

Gooseberry fruits gathered before they commence to ripen are excellent for bottling, whilst preserve is equally good whether made from the ripe or the immature fruits. Various delicious sweets are prepared from Gooseberries, while as a dessert fruit the Gooseberry already occupies a high position. *Ralph E. Arnold.*

HOME CORRESPONDENCE.

Lorette Pruning.—Assuming myself to be the enquirer that Mr. Impey refers to in your issue of July 23, I would esteem it a favour to be allowed to endorse all that he states in favour of Lorette pruning, except in the case of converting trees which have been pruned on the old system. I find when very heavy cutting out has to be done, the transition period may well be extended to more than three years. Firstly, the thinning out in many cases appears to be far too drastic, and, secondly, by the slower process a crop of fruit is obtainable until the Lorette pruned branches come into bearing. The ultimate shape of the tree must always be kept in view. Like Mr. Impey, I am a new but enthusiastic convert to this system. My garden being situated on a light, shallow soil, where site preparation is absolutely imperative, the Lorette system appealed to me as being one which would practically eliminate the continual pruning away of hosts of useless shoots, thereby concentrating the nutriment obtained from a restricted root-run to the production of fruit

spurs and fruits. In my opinion, a great advantage may be claimed for the Lorette system, for inasmuch as all pruning is carried out during the growing season, the wounds are completely healed a few weeks after the operation, which is surely better, from a disease-resisting point of view, than a cut made in mid-December, which cannot hope to callus over until the following spring. By translating *Lorette Pruning* from the French, the late Mr. W. R. Dykes gave us a book full of interest and at a price within the reach of all. *Joseph Cheer, Red Gables, Beech Avenue, Purley.*

Prunus Pissardii Fruiting.—On two trees of *Prunus Pissardii* in these gardens several fruits are hanging; the trees are side by side and facing south. When they were planted I cannot say, but they have reached a height of twenty feet or more. The fruits are the size of a good Damson, not quite so dark in colour as the foliage of the trees. As I do not remember having heard of *P. Pissardii* fruiting previously, I send this note. *J. Kitt, Wasing Place Gardens, Near Reading.*

Treatment of Golf Greens.—I read with great interest the article appearing in your issue of July 23, on the "Treatment of Golf Greens," but I am not quite sure whether the writer means five lbs. of sulphate of ammonia for 1,000 square feet, or five lbs. of the mixture of sulphate of ammonia and sand. Five lbs. of sulphate of ammonia per thousand square feet works out at nearly two cwt. per acre and this would be a very heavy dressing for a season, and if applied fortnightly would, I fear, tend to burn the grass. I can quite imagine such liberal manuring would crowd out everything except the grass, but it may make the cutting of the lawn or golf green no easy matter. I imagine there must be a slip somewhere, and that the figures given are either five lbs. of the mixture (no small dressing) or else, the "one thousand" refers to square yards instead of square feet. *William Low, Laurencekirk.*

[The figures given on p. 61 are quite correct; the dressing works out at about three-quarters of an ounce of sulphate of ammonia per square yard.—EDS.]

Failures with Strawberries.—Like Mr. Bullock (p. 115) we are battling against the problem of Strawberry failure, and it is satisfactory to learn that nurserymen and others are giving the subject their special attention. I am inclined to think that climatic conditions are, to a certain extent, responsible for the spread of the trouble. I obtained some plants in pots last August from an old-established firm of nurserymen; half were potted up for forcing, others were planted in a cold frame, and the rest put outside in good ground some distance away from the old beds. Those in pots and cold frames proved satisfactory and gave good fruits of splendid flavour, while those outside dwindled away; the autumn was cold and wet, and the plants made no attempt to grow. In the spring of this year, I obtained from the same firm five hundred open-ground runners of Royal Sovereign, and laid them in a shallow trench, somewhat shaded; when they had made a few fresh roots they were planted on a piece of ground which until three years ago had carried Black Currants for a long number of years; this was trenched deeply and allowed to lay fallow for a year, and in the second year it was planted with Potatoes. It was on this site the runners were planted last spring. May being a hot, dry month the Strawberry plants were mulched with old, rotten manure; since then they have, on the whole, made splendid plants. There are a few weak specimens, about two dozen, but no red leaf. The runners have been removed regularly. What this batch will look like next spring remains to be seen. I am not very optimistic because the present wet, sunless season has encouraged strong, sappy foliage, whereas sun is required to ripen up the crowns that are now becoming prominent. We relied on home-grown runners until three years ago, when the deterioration set in, and we had to obtain fresh stock both for forcing and for outdoor crops. *A. B. Wadds, Englefield Gardens, Reading.*

SOCIETIES.

BRITISH GLADIOLUS.

THE exhibition of the British Gladiolus Society was held at Taunton on Wednesday and Thursday, August 10 and 11, in conjunction with the Taunton Deane Horticultural and Floricultural Society's fifty-fifth annual show. The schedule included ninety-eight classes; several cups, medals and other trophies were offered for competition by supporters of the Society.

One of the most valuable prizes was a silver tea service valued at £25, to be won outright, offered by Messrs. Abol, Ltd., for an exhibit demonstrating the advancement of the Gladiolus as a decorative cut flower, to be arranged on a floor or table space of one hundred superficial feet. This was won by Mr. H. CLARKE, of Taunton; second Messrs. HEWITT AND CO., LTD., Solihull; third, Messrs. W. TRESEDER, LTD., Cardiff. For a display of Gladioli, arranged for artistic effect on a table space twenty feet by four feet, prizes of £15, £5 and £3 were offered. The premier award was made to Mr. W. J. UNWIN, Histon, and the other exhibitor, Mr. W. GLEN, Chippenham, was awarded the second prize. Messrs. W. J. UNWIN also won the first prize for a collection of *Primulinus* hybrids; second, Messrs. K. VELTHUYS AND CO., Holland; third, Mr. W. GLEN.

MESSRS. KELWAY AND SON, Langport, excelled in the class for twenty-four new varieties or seedlings, distinct, one spike of each, of large-flowered Gladioli, and Messrs. K. VELTHUYS AND CO. were second. The best twenty-four varieties of *Primulinus* Gladioli, distinct, new sorts or seedlings, were shown by Messrs. R. H. BATH, LTD., Wisbech; second Messrs. KELWAY AND SON.

Mr. W. GLEN was the only exhibitor of twelve distinct varieties of large-flowered Gladioli, and he was awarded the first prize. Messrs. K. VELTHUYS AND CO. showed the best twelve distinct varieties of *Primulinus* Gladioli; the best three distinct varieties of large-flowered white Gladioli; the best pink, the best scarlet, and the best mauve or lavender varieties. The finest salmon and scarlet Gladioli were shown by Mr. W. YANDELL, while Mr. A. E. AMOS, Colchester, excelled in the class for purple varieties.

There was keen competition in the single spike classes for large-flowered and *Primulinus* varieties, there being four to seven entries in each class. The chief prize winners were Mr. W. YANDELL, who won nine first prizes, seven second prizes, and one third prize; Mr. A. E. AMOS, who won ten first prizes, one second, and three third prizes; and Mr. W. GLEN, who won two first prizes, ten seconds, and four third prizes.

Mr. A. E. AMOS was very successful in the classes for seedlings. He won the first prize for six large-flowered varieties with Jack Hobbs, Capt. P. Eckersley, Sidney Firman, Geraldine, Lieut. Walton O'Donnell, and John Ansell, also in the class for three varieties of new *Primulinus* seedlings with Christine Prior, Vera Prior and Basil Prior.

Special awards were made as follow:—

The Society's Championship Cup for new large-flowered varieties, to Messrs. KELWAY AND SON, Langport; The Society's Championship Cup for new *Primulinus* varieties, to Messrs. R. H. BATH, LTD., Wisbech; the President's Special Prize in Group "A," (open), to Mr. W. YANDELL, Maidenhead; the President's Special Prize for Classes 10 to 19 (open), to Messrs. K. VELTHUYS AND CO.; The "Kelway" Challenge Cup for British varieties, to Mr. W. E. SAMUEL, Wrexham; the "American" Challenge Vase for varieties of American origin, to Major G. CHURCHER; the "Unwin" Challenge Cup for twenty-four varieties, to Mr. I. S. THOMAS, Liverpool; the "Bath" Championship Cup for twenty-four spikes, to Mr. A. E. AMOS; the "Garden" Challenge Trophy, for six spikes, to Mr. I. S. THOMAS; the Society's Silver Medal for the largest number of points in Group "B," to Mr. W. E. SAMUEL; and the *Gardening Illustrated* Medal in Group "C," to Mr. F. W. RANSOME, Colchester.

TRADE GROUPS.

Non-competitive exhibits were numerous and good. The Society's Gold Medal offered for the best trade exhibit (1,000 square feet) was awarded to Messrs. KELWAY AND SON, Langport.

A Gold Medal and the Society's Silver-Gilt Medal were awarded to Messrs. SUTTON AND SONS.

Silver-Gilt Medals were awarded to Messrs. J. CARTER AND CO., Messrs. R. H. BATH, LTD., Messrs. J. J. GRULLEMANS, LTD., Messrs. K. VELTHUYS AND CO., and Mr. W. J. UNWIN.

Silver Medals were awarded to Messrs. DOBBIE AND CO., LTD., and Messrs. HEWITT AND CO., LTD.

ROYAL HORTICULTURAL OF IRELAND.

THE summer show, held in conjunction with the Royal Dublin Society's Horse Show, in a spacious hall allocated for the purpose, proved highly successful, not a few of the more critically disposed visitors among the thousands attending it proclaiming it the best yet held under the auspices of the veteran Society. Trade exhibits, as usual, were the backbone of the show, to which six Gold Medals were awarded by the judges, apart from Silver and Bronze Medals for smaller collections.

Gold Medals were awarded as follow:—Messrs. ALLWOOD BROS., for a superbly set up stand of Carnations, of which four hundred dozen blooms had been sent from the Wivelsfield Nurseries, and among which White Pearl, Coral Glow, Topsy, Spectre, Triumph, Butterfly, Maine Sunshine, and the two Laddies (pink and red), each *en masse*, were conspicuous; to Messrs. JAMES CARTER AND CO., who contributed another cross-Channel exhibit of choice vegetables.

Other outstanding features of the show were the tastefully designed and admirably furnished model gardens for which the Dublin firms of Sir JAS. W. MACKEY, LTD., and Messrs. W. DRUMMOND AND SONS, LTD., were responsible, Messrs. MACKEY's exhibit comprising a brilliant bed of tuberous Begonias, with borders of choice hardy flowers at the entrance to the hall, these making an imposing set off to floral groups beyond where Messrs. DRUMMOND completed the *coup d'oeil* in a quiet and restful expanse of rock gardening with alpine planting, and a central pool wherein Water Lilies added to the effect. As implied, each were Gold Medal exhibits; similar honours being gained by Mr. S. Gilthorpe, Monkstown House Nurseries, Co. Dublin, for well staged Gladioli in quantity, making a great splash of colour, and Messrs. ALEX. DICKSON AND SONS, the "Hawlmack" firm, for a large, light and graceful stand of Roses, Carnations and Sweet Peas.

Silver Medals were awarded to Messrs. CHAS. RAMSAY AND SON, Royal Nurseries, Ballsbridge, for foliage and flowering plants; to Messrs. PENNICK AND CO., Delgany Nurseries, Co. Wicklow, for choice hardy flowers; THE DUBLIN NURSERY CO., Blackrock, for Roses; Mr. JAMES DUGAN, Carlow, for a collection of border Phloxes; and the Rt. Rev. and Hon. B. J. PLUNKET, St. Anne's, Clontarf (gr. Mr. P. D. Reid), for a collection of forty species and varieties of Thyme in pans—quite as interesting as it was an uncommon exhibit.

Bronze Medals were awarded to Major FRENCH, Booterstown, for a collection of vegetables and Sweet Peas; and Messrs. HOGG AND ROBERTSON, Dublin, for greenhouse and window plants; while Mr. A. L. SPEIRS, Burtown Nurseries, Athy, Co. Kildare, was highly commended for rock and alpine plants, as was Mr. JAMES ALLAN, seedsman, Kilkenny, for hardy flowers.

The Hon. A. E. GUINNESS, Glenmaroon (gr. Mr. W. Stevens), was an easy first prize winner for a group of foliage and flowering plants, open to all; Messrs. BRITTAIN, Donnybrook (gr. Mr. D. Crassen), second. In the open class for a group arranged for effect on 200 superficial feet, competing for the President's Cup (The Marquis of Headfort), THE DONARD NURSERY CO., Newcastle, Co. Down, with a glorious group, in which towering sheaves of *Sparaxis pulcherrima* played a prominent part, was another easy winner, with Mrs. RAYMOND STEPHENSON, Cranford, Stillorgan Road (gr. Mr. M. Buggle), second. There was but one entrant for the collection of cut flowers,

filling a table space of twenty-four feet by six feet, and that was placed second. Chief winners in the smaller collections of hardy cut flowers were the Misses BIRD, Dundrum, Co. Dublin (gr. Mr. Smith); Major KELLY, Montrose, Donnybrook (gr. Mr. J. McDermott); Mrs. BERNARD, Belfield, Stillorgan Road (gr. Mr. J. Dawson); Captain DALY, Templeogue (gr. Mr. J. Murtagh); Mr. C. WISDOM HELY, Oakland, Rathgar (gr. Mr. J. H. Orr); and Mrs. GUBBINS, Kilfrush, Co. Limerick (gr. Mr. J. Shepherd). Canon KINGSMILL-MOORE, D.D., Cedar Mount, Dundrum, excelled with hardy Ferns, with Miss CUNNINGHAM, Trinity Hall, Dublin (gr. Mr. J. McLindon), and Captain DALY following as placed.

Roses, in the classes restricted to the trade, found honours divided between Messrs. S. MCGREDY AND SON, Royal Nurseries, Portadown, and the DONARD NURSERY Co.; Messrs. MCGREDY AND SON put up a big group arranged for effect on a table space of one hundred square feet. Conspicuous among these Roses we noted three of the firm's new Gold Medal seedlings, viz., Mabel Lynas, Margaret McGredy and Patience. The same firm contributed the best six baskets of Roses, distinct, and also the best stand of new varieties not exhibited prior to 1925. The DONARD NURSERY Co. won outright the Challenge Cup presented by Mrs. H. B. Maloney, with forty-eight blooms, and won the first prize for twelve blooms distinct. In five classes for Roses in the amateurs' section, the first prize winners were Mr. C. WISDOM HELY, Mrs. MCKEEVER, Batterstown, Co. Meath; and Major KING-FRENCH, Dollard, Clonsilla, the Hon. A. E. GUINNESS having the best six vases in a long array of Ramblers.

Dahlias were poorly represented. Miss CUNNINGHAM had the best stand of tuberous-rooted Begonias, and Mr. J. G. KNOX, Templeogue, the best six doubles. Antirrhinums were good, Mrs. WEST, Kileroney, Bray (gr. Mr. C. Coster), the Hon. A. E. GUINNESS, and Mr. C. WISDOM HELY being placed as mentioned. Pentstemons and Phloxes were fair. For Gladioli, twelve vases distinct, three stems in a vase, Mrs. WEST won the Challenge Cup presented by herself, and also led in the open class for a group twelve feet by four feet, Mr. S. GILTHORPE being placed second. Annuals, shown on a space ten feet by four feet, were good and here Mr. WISDOM HELY was first, Mr. C. L. WRENN second, and Miss DARLEY, The Orchard, Bray (gr. Mr. P. Mohan), third. The Hon. A. E. GUINNESS had the best twelve vases of Carnations, Miss DARLEY, Violet Hill, Bray (gr. Mr. J. Murphy), the best six vases, and Mrs. CAULFIELD the best border varieties. Much interest was shown in the class for a vase of any hardy plant not classed competing for the Bronze Medal presented by *Gardening Illustrated*, this being won by Mr. WISDOM HELY with a good bunch of *Campanula pyramidalis alba*, the less seen *Veratrum nigrum album*, shown by Miss WYNNE, being placed second.

Sweet Peas were plentiful and, for the season, good, Mr. A. F. McNULTY, Bray (gr. Mr. J. Sutton), being first prize winner in the champion class with eighteen bunches, distinct; Captain E. C. SHIRLEY, Lough Fea, Carrickmacross (gr. Mr. W. H. Hinch), second; Miss DARLEY, Mr. WISDOM HELY, Mrs. FOSTER and Mr. J. MORAN excelled in the smaller classes. In the ladies' class for the best basket, Mrs. GILTHORPE led, followed by Mrs. SEAMAN and Miss GILTHORPE in the order named. For the group of Sweet Peas on a table sixteen feet by four feet, Mrs. WEST secured first prize for sturdier blooms than those from Mr. W. E. SANDS, Lisburn, N. Ireland, who had a light and elegant arrangement.

The thirty-four classes for fruit were generally well filled, excepting Grapes, which, with the exception of fair Black Hamburgs from Mr. HELY and Mrs. GUBBINS (first and second) were not represented. Peaches and Nectarines were good; Mr. HELY, Mrs. HAMILTON, Luttrellstown, Clonsilla (gr. Mr. C. Pilgrim), and Major KELLY being placed in the order named for Peaches; Mr. J. C. TOLER-AYLWARD, Shankill Castle, Co. Kilkenny (gr. Mr. H. Hall), Mrs. HAMILTON and Mrs. BRITAIN excelling with the latter. Apples generally appeared undersized; the SISTERS OF CHARITY, Bray (gr. Mr. J. Tully) had the best

collection of six dishes, with Captain DALY second, and Mrs. HAMILTON third, out of seven entries. Single dishes call for little comment, the chief prize winners being those already noted. Gooseberries were plentiful, the outstanding amber variety being Mr. H. E. JOLY's Golden Wonder, raised by him at Millbrooke, Rathangan, Co. Kildare, and which had previously been awarded a Silver Medal.

Vegetables rather surprised some cross-Channel friends by their excellence and numbers; two fine collections were shown on tables twelve feet by four feet in the champion class, for which the Hon. A. E. GUINNESS and Mrs. BERNARD received first and second prizes, respectively; the first-named also excelled in the class for twelve distinct kinds. The Hon. GORDON CAMPBELL, Clonard, Terenure (gr. Mr. J. Cook), won first prize for a collection, and obtained several first prizes in the single dish classes.

NORTHAMPTON MUNICIPAL HORTICULTURAL.

THIS society held its twelfth annual show on August 3 and 4, in Abington Park, when over 21,000 people paid for admission. The trade exhibits were exceedingly fine. Mr. W. J. UNWIN, Histon, won the Edward Lewis fifty guinea Challenge Cup offered for the best non-competitive display in the show, for the second time in succession. His Gladioli were especially fine.

The Dover fifty guinea Challenge Rose Bowl, offered for a group of Roses, was won by Mr. E. J. HICKS; second, Mr. H. DREW, Longworth, Bucks.

The best exhibit of Sweet Peas, for which the Astbury twenty-five guinea Challenge Cup was offered, was shown by Messrs. KING AND CO., Coggeshall.

A fifty-guinea Challenge Cup was offered for a collection of perpetual-flowering Carnations, and this was won by Messrs. C. ENGELMANN, LTD., Saffron Walden.

The entries in the open classes were numerous. Mr. HOLMES, Chesterfield, excelled in the class for a group of flowering and foliage plants; second, Messrs. H. E. AND M. LACK, Wellingboro', who won the first prize for a collection of Begonias; second, Mr. D. C. GUTHRIE, of East Haddon Hall (gr. Mr. P. Barr).

Gold Medals were awarded to Messrs. I. HOUSE AND SON, Bristol, for Scabious; Messrs. BAKERS, Wolverhampton, for Phloxes; Messrs. T. PERKINS AND SONS, Northampton, for a miscellaneous collection of plants and cut flowers. (This firm was also awarded a Gold Medal for a rockery, and a Silver Medal for a fine collection of ornamental trees and shrubs); Messrs. JOHN PERKINS AND SON, Northampton, for herbaceous Phloxes; and Messrs. DANIELS BROS., Norwich, for a miscellaneous collection of plants and cut flowers.

Silver Medals were awarded to Messrs. RAMSBOTHAM AND CO., Bletchley, for a collection of Roses and Ferns; and to Messrs. WOOLMAN, Shirley, Birmingham, for a collection of border Carnations.

NATIONAL CARNATION AND PICOTEE.

NORTHERN SECTION.

THE annual exhibition of the above Society was held on Saturday, August 6, in the British Legion House, Sheffield.

The hall was crowded with flowers and competition was very keen in the amateur classes. In Division I. for flowers from the open border, a very high standard was maintained throughout the whole division, and the exhibitors are to be congratulated on the excellence of their flowers.

In Division II, for pot grown plants, Mr. JOHN MACFARLANE, of Airdrie, put up a grand collection and won the first prize in every class.

The judges and visitors from many parts of the country congratulated the Secretary and officials on the most excellent show, and remarked that Sheffield had beaten all records

and put up the finest display of Carnations ever seen outside London. There were five exhibits by trade growers.

Almost all the exhibits were staged in vases, the staged and dressed board classes only receiving two entries. In the novices' division there were six exhibits. The following awards were made.

Division I.—Amateurs; blooms from the open border. Three Selves (dissimilar).—First, Mr. W. SECKER; second, Mr. S. RABJOHN; third, Mr. A. J. WOODLAND. Three Fancies (dissimilar): First, Mr. W. SECKER; second, Mr. S. RABJOHN. Three Yellow Ground Fancies (dissimilar): First, Mr. S. RABJOHN; second, Mr. W. SECKER; third, Mr. G. HILL. Three White Ground Fancies (dissimilar): First, Mr. W. SECKER; second, Mr. G. HILL; third, Mr. S. E. FLETCHER. Three blooms, Clove-scented (dissimilar): First, Mr. W. SECKER; second, Mr. S. RABJOHN; third, Mr. A. J. WOODLAND. Twelve blooms, Selves and Fancies (dissimilar): First, Mr. W. SECKER; second, Mr. A. J. WOODLAND; third, Mr. S. RABJOHN. Four Vases, three blooms, any variety: First, Mr. W. SECKER; second, Mr. S. RABJOHN; third, Mr. A. J. WOODLAND.

Division II.—Blooms from plants under glass.—Three Selves (dissimilar): First, Mr. JOHN MACFARLANE; second, Dr. G. H. MEAD; third, Mr. S. RABJOHN. Three Fancies (dissimilar): First, Mr. J. MACFARLANE; second, Dr. G. H. MEAD. Three Yellow Ground Fancies (dissimilar): First, Mr. J. MACFARLANE; second, Dr. G. H. MEAD; third, Mr. S. RABJOHN. Three White Ground Fancies (dissimilar): First, Mr. J. MACFARLANE; second, Dr. MEAD. Three blooms Clove-scented (dissimilar): First, Mr. J. MACFARLANE. Three Picotees (dissimilar): First, Mr. J. MACFARLANE. Twelve blooms, Selves and Fancies (dissimilar): First, Mr. J. MACFARLANE. Four Vases, three blooms any variety: First, Mr. J. MACFARLANE.

In the classes for novices who grow fewer than one hundred plants, Mr. S. TAYLOR won four first prizes.

In the Open Classes, Mr. H. WOOLMAN, Mr. P. SMITH and Messrs. TORRANCE AND HOPKINS were the most successful exhibitors.

The National Carnation Society's Certificate offered for six blooms of any variety or varieties, was awarded to Mr. JOSEPH FIRTH, Liversedge, Yorkshire.

The President's Cup, offered for the premier bloom in the show, and the Edmund Charrington Medal were both awarded to Mr. H. WOOLMAN, Birmingham, for the variety Mrs. Edmund Charrington. The Presidents' Challenge Cup and Society's Silver Medal for the highest points in Division I were awarded to Mr. W. SECKER. The Society's Silver Medal for the highest number of points in Division II, was awarded to Mr. J. MACFARLANE, Airdrie, Scotland. The Society's Silver Medal, offered for the largest number of points in Division VI, was awarded to Mr. H. WOOLMAN, Birmingham.

NEW VARIETIES.

FIRST CLASS CERTIFICATES.

Jim Dalton, lavender-mauve self, shown by Messrs. TORRANCE AND HOPKINS; M. Black, dark crimson self, shown by Mr. P. SMITH; and British Legion, yellow-ground Fancy, shown by Mr. H. WOOLMAN.

AWARDS OF MERIT.

Englinton, rose madder Fancy and Rosie, deep rose-pink, both shown by Messrs. TORRANCE AND HOPKINS; Clarence, yellow ground Fancy, shown by Mr. H. WOOLMAN; Allan-a-Dale, yellow-ground Fancy, shown by Mr. J. FIRTH, Liversedge.

NON COMPETITIVE EXHIBITS.

The Society's Gold Medal was awarded to Messrs. C. ENGELMANN, LTD., for a grand display of perpetual-flowering Carnations.

Silver Medals were awarded to Mr. E. H. PEARSON (amateur) for a display four feet by three feet; to Messrs. TORRANCE AND HOPKINS, Glasgow; and Mr. JOHN KIRKHAM, Chapel-town, for trade groups.

ROYAL CALEDONIAN.

At the monthly meeting of this Society, held at 5, St. Andrew Square, Edinburgh, on August 2, at which Mr. E. P. Laird, Councillor, presided, Mr. J. S. Brunton, Burnley, read a paper on "Refrigeration Applied to Horticulture." Refrigeration had, he said, revolutionised the methods of the florist, and had been the means of increasing the export of flower roots and flowering plants from such countries as Holland, Germany and Japan, from which large quantities of these plants were imported into Britain annually, as well as into the United States and other countries. By this means a succession of flowers could be maintained throughout the year, and scientific and practical men working together might yet discover new systems of treatment and new subjects which would still further benefit the industry and mankind generally.

The exhibits were:—Sweet Peas, by Miss BURTON, Polton (awarded a Silver Medal); Campanula Hallii, by Mr. R. B. LOWER, Edinburgh, and Dianthus Napoleon III, by Messrs. LAIRD AND DICKSON, Edinburgh. Mr. FARQUHARSON, Carlowrie Gardens, Kirkliston, was awarded first prize for a vase of Sweet Peas, and Mr. R. B. WHITE, Murrayfield, second. Mr. WM. LAMB, Prestonfield, Edinburgh, was awarded first prize for two Cauliflowers, and Mr. W. G. SCOTT, Murrayfield, second prize.

ROYAL HORTICULTURAL OF ABERDEEN.

AUGUST 18, 19 AND 20.—Favoured with delightful weather, the Earl of Caithness gave a happy send-off to the annual show of the Royal Horticultural Society of Aberdeen in the Hazlehead Public Park, kindly loaned by the Aberdeen Town Council on the above dates. No finer setting could have been chosen for a floral display than this finest of Aberdeen's communal parks. The exhibits were accommodated in large marquees, which fitted beautifully into the sylvan surroundings, and the famous band of H.M. 13/18th Hussars (Queen Mary's Own) provided excellent music, while in the evenings electric fairy lamps dotted all over the park formed an entrancing scene. The entries numbered 1,161, twenty-one more than those of last year, and notwithstanding the abnormally unfavourable season, the display proved one of the best ever held under the auspices of the Society. The gate receipts amounted to £643, a sum only exceeded once in the long history of the Society—in 1892.

PLANTS IN POTS.—The marquee devoted to this division proved a source of great interest and pleasure to the many visitors. The best of the circular groups of pot plants arranged for effect on the ground, and not exceeding ten feet in diameter, was exhibited by Mr. JAMES COOK, of Enfield (gr. Mr. Robert Murray). The group comprised remarkably well-grown specimens of Dracaenas, Lilliums, Coleus, Ferns of various kinds, Begonias, Gloxinias and Celosias; second, WILLIAM MACKINNON, Esq., The Firs, Murtle, near Aberdeen, whose gardener, Mr. A. Murray, is a brother of the Enfield gardener; while A. E. BENZIE, Esq., Morkeu (gr. Mr. William Henderson) was third. In the class for four specimen plants, two flower and two foliage, Colonel W. S. GILL, C.B., of Dalhebit, Aberdeen (gr. Mr. Alex. Brebner), won handsomely. Included in the exhibit was a finely grown *Disa grandiflora*, which was greatly admired. Ferns formed a great display, and leading honours went to Dalhebit, Captain E. F. LUMSDEN, of Balmedie (gr. Mr. William Morrison), and Morkeu. Sir THOMAS JAFFREY, of Edgehill (gr. Mr. James Cook), was also a prominent winner in the classes for Ferns. Pelargoniums were well shown, and here again Mr. BENZIE of Morkeu was successful. Plants for dinner table decoration formed a pleasing feature, and of these Sir THOMAS JAFFREY, Edgehill, had the best. In the classes for single and double Begonias, Mr. JAMES COOK, of Enfield, led in fine style, as he also did for Gloxinias.

CUT FLOWERS.—There was no lack of evidence of the despoiling effects of the recent heavy rains in the exhibits of cut flowers, yet this division

proved the most delightful and attractive of the whole show. For the best eighteen H.P. and H.T. Roses, chief honours including the Silver Challenge Cup, were won by Captain E. F. LUMSDEN with a capital entry. In the class for decorative Roses, at least four varieties, exhibition varieties excluded, and for six vases of Roses, distinct varieties, three blooms in each, Colonel W. S. GILL, was placed first, and he also took premier place for twelve cut trusses of Zonal Geraniums.

Collette Dahlias from Grandholm House, Aberdeenshire (gr. Mr. C. Cox), and the twenty distinct varieties of cut flowers and fine foliage bedding plants, including annuals, each sort to be in a bunch, on a space not exceeding four feet by five feet, from the same gardens, were outstanding features. Hardy herbaceous flowers (twelve bunches) were finely shown by Captain LUMSDEN; whilst the EARL OF MORAY, Darnaway Castle, Forres (gr. Mr. A. S. Dow), showed the best twelve bunches of annuals. Begonias, both single and double, were greatly admired, the principal honour going to Enfield for double, and to the Gardens, Logie, Pitcaple, Aberdeenshire (gr. Mr. P. F. McQueen), for single blooms. The displays of Sweet Peas were remarkably good, and in the whole of the nine classes Mr. J. A. GRIGOR, Woodlands, Banff, dominated. His finest varieties were Royal Purple, Sybil Henshaw, Mrs. A. Hitchcock, Powerscourt, Gleneagles, Chieftain, Red Gauntlet, Mary Pickford, Pink Perfection and Picture. At the Glasgow and West of Scotland Sweet Pea Society's show Mr. GRIGOR secured no fewer than thirteen first prizes in twenty-one classes, a record of which any grower might be justly proud. At Aberdeen he cleared the boards. The EARL OF MORAY also showed some grand Sweet Peas.

FRUIT.—The deteriorating effects of the season's unpropitious weather were very marked in this division; nevertheless, the display made was uncommonly good. For the best collection of hardy fruits, six dishes, not more than two dishes of any species (open), the honours went to LORD SEMPILL, Fintray House, Aberdeenshire (gr. Mr. W. D. Anderson), for a capital exhibit, and the second and third prizes were awarded to Mr. NORMAN DUNCAN, Johnston House, Aberdeen. The last-named also took chief honours for Gooseberries. The best Strawberries came from Woodthorpe Gardens, Murtle, Aberdeenshire (gr. Mr. George Tocher), and Mr. R. DUNCAN, Old Montrose, led for Cherries. The EARL OF MORAY had the best Raspberries, Plums and Red Currants. Black Currants, which suffered badly in the north-eastern district of Scotland this season, were well-shown by Mr. ALEX. FERGUSON, Castle Gardens, Ellon, Aberdeenshire. Grapes were shown well by Mr. WILLIAM GRANT, Crathes Castle Gardens, Mr. BENZIE, and LORD SEMPILL. Leading places for Melons and Peaches went to The Firs, Murtle (gr. Mr. A. Murray). Mr. P. F. McQUEEN, Ellon Castle, showed the best Nectarines. Honeywood House, Aberdeenshire (gr. Mr. George Meldrum), excelled with dessert Apples, and Captain LUMSDEN, for culinary Apples.

VEGETABLES.—These are always exhibited well at Aberdeen, especially Potatoes. The blue riband of this division was awarded to the best collection of vegetables, arranged on a table space four feet by three feet, and comprising eleven varieties, viz., Pea, Cabbage, Cauliflower, Potato, Turnip, Carrot, Onion, Parsley, Beetroot, Celery and Tomato, and it was worthily won by Mr. R. W. SMITH, of Crowmallee, M.P. for Central Aberdeenshire (gr. Mr. James Mitchell). The second and third prize collections came from Logie and Old Montrose respectively. Mr. WILLIAM LAWSON, Cornhill, Aberdeen, was, as is his wont, a very prominent and successful prize winner in many of the Potato classes. Mr. J. A. GRIGOR, won first prizes for round white and round coloured Potatoes, and also led for twelve pods of Broad Beans. Mr. JAMES COOK, Colonel GILL, the EARL OF MORAY, Sir THOMAS JAFFREY, and Mr. W. MACKINNON, The Firs, were all prominent prize winners in the vegetable classes.

As usual, a fine display was made in the

nurserymen's and florists' classes, the chief honours going to Messrs. J. AND R. BURNS, Aberdeen, who, with the exception of the best thirty-six Rose blooms, the leading place for which was taken by Messrs. ADAM AND CRAIGMILE Fernielea, Aberdeen, carried practically everything before them.

The exhibits by local nurserymen and seedsmen formed a very important feature of the show. Exhibits were staged by Messrs. BEN. REID AND CO., Messrs. W. SMITH AND SON, Messrs. KNOWLES AND SONS, Mr. JAMES ROBERTSON, and Messrs. ADAM AND CRAIGMILE, all of Aberdeen, while Messrs. ALLWOOD BROTHERS contributed one of their noteworthy exhibits of Carnations.

The weather throughout the three days of the show was wonderfully good, the attendance of visitors much larger than last year.

BAKEWELL FLOWER SHOW.

THE flower show held in connection with the seventy-fourth exhibition of the Bakewell Farmers Club, on August 4, attracted some important exhibits from nurserymen, and these trade shows, collectively, made a very imposing display. A number of classes was provided for local visitors, and these were well filled, but the great success of the exhibition resulted from the displays by traders.

Messrs. SUTTON AND SONS were awarded a Gold Medal for Sweet Peas and Gladioli, attractively arranged with Palms and other foliage plants; Messrs. JAMES CARTER AND CO. were awarded a Gold Medal and a special trophy of Crown Derby ware for a remarkably fine display of vegetables flanked on either side with groups of Gladioli; Messrs. W. WOOD AND SON were also awarded a Gold Medal for horticultural sundries, tools, etc., and various beautiful flowering plants, including alpinists; Messrs. C. ENGELMANN, LTD., were also awarded a Gold Medal for one of their noteworthy exhibits of Carnations.

Other firms to which Gold Medals were awarded were Messrs. ALEX. DICKSON AND SONS, for Roses; Messrs. DOBBIE AND CO., for Sweet Peas and Dahlias; Mr. J. C. ALLGROVE, for fruit trees in pots and about sixty varieties of gathered fruits; Messrs. CYPHER AND SONS, for fine foliage, stove and greenhouse plants, both in and out of flower; Messrs. BLACKMORE AND LANGDON, for Begonias; Messrs. J. ARTINDALE AND SON, for hardy herbaceous and bulbous flowers, this exhibit receiving in addition a special award of Crown Derby ware; Mr. E. WOOLMAN, for Dahlias, Begonias and border Carnations; Messrs. BROOKE BRAY, LTD., for floral designs; and Mr. T. ROBINSON, for Roses, this meritorious exhibit also receiving a special trophy in the form of Crown Derby ware.

Other exhibitors were Messrs. DICKSON AND ROBINSON, THE CHALK HILL NURSERIES, Messrs. W. CUTBUSH AND SON, Messrs. ISAAC HOUSE AND SON, Messrs. PROCTORS, Messrs. J. FORBES, LTD., Messrs. DICKSON'S NURSERIES, Chester; Messrs. DICKSON, BROWN AND TAIT, and Mr. W. SYDENHAM, Melbourne, Derbyshire.

DUMBARTONSHIRE SWEET PEA.

UNFAVOURABLE weather experienced for a week previous to the show of this Society, which is held alternately at Dumbarton and Helensburgh, had a bad effect on the quality and number of the exhibits. Several exhibitors were compelled to cancel their entries.

In the open classes, Mr. J. A. GRIGOR, Banff, excelled in the classes for eighteen and twelve vases, but although the blooms were not lacking in size, they bore evidence of the untoward weather. Mr. GEORGE BALLINGALL, Dumbarton, was the most successful competitor in the gardeners' and amateurs' division; he won the Society's Cup with twelve vases, of which the varieties Olympia, Ivory Picture, Charming, Magnet, Youth and Powerscourt were best. He had the best trio of new varieties in Gleneagles, Olympia and Chieftain, and he also excelled with six particularly fine vases of Elegance, Charming, Ivory Picture, Mrs. Horace Wright, Olympia and Powerscourt.

For the second year in succession, the Amateurs' Cup was awarded to three vases staged by Mr. GEORGE BLACKIE, and it now becomes his property. It was a strong trio consisting of Royal Pink, Model and Royal Mauve, and the latter received an additional honour as the best vase in the amateurs' section. Other successful competitors were Messrs. JAMES MALTMAN, Rhu; Mr. J. MCGOWAN, Alexandria; Mr. ALEX. SUTHERLAND, Mr. T. W. CARRIE and Mr. FRANK DUMBAR.

Roses were a small class, and here the principal prize winners were Mr. John SMELLIE, Helensburgh (six vases); Mr. JAMES JACK (two vases, ramblers); Mr. WILLIAM HOLMES, Helensburgh (three vases); Mr. A. BORTHWICK, (pink and red); Mr. J. McROBBIE, Mr. J. BAIN and Mr. CHARLES MACLACHLAN. A bloom in Mr. BORTHWICK'S vase of Earl Haig received the special prize offered for the best Rose in the show.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THERE was a record attendance of 260 members at the outing on Saturday, the 13th inst., to Messrs. AUSTIN AND MCASLAN'S nursery at Cathcart, when the Rose and Sweet Pea trials were the special attraction. The Sweet Pea trials are of a most comprehensive character, and in addition to testing the purity of the stocks they are intended to demonstrate the merits of autumn- and spring-sowing, and the three methods of pruning the plants, viz. on single stems, naturally and from seeds sown in the open ground in April. Altogether 140 varieties were sown in triplicate, and so far the Peas grown on the single stem system have given the finest blooms, while the naturally-grown flowers were produced in the greatest profusion.

The visitors were provided with voting cards, and with the object of stimulating interest in the trials, the firm offered prizes to competitors whose twelve Roses and twelve Sweet Peas approximated nearest to the popular votes. By this method two representative collections were obtained as follows:—

Roses:—Betty Uprichard, Angele Pernet, Shot Silk, Frau Karl Druschki, Etoile de Hollande, Mabel Morse, Ophelia, General McArthur, Caroline Testout, Los Angeles, Ivy May and Mrs. Henry Morse. Three competitors named ten of the successful dozen.

Sweet Peas:—Royal Pink, Picture (cream-pink); Powerscourt (lavender), Charming (cerise), Grenadier (scarlet), Model (white), Charity (crimson), Warrior (maroon), Youth (Picotee edge), Royal Purple, Blue Bird and Royal Sovereign (any other colour). One competitor succeeded in naming ten and five competitors nine of the successful twelve varieties. The visitors were entertained to tea by the firm

BANFFSHIRE.

AUGUST 17.—The annual show of the Banffshire Horticultural Society, recognised as one of the leading events of its kind in the north-east of Scotland, was held in the Princess Royal Park, Banff, on the above date. Lady Findlay of Aberlour, wife of the chief proprietor of the Scotsman, in a speech highly eulogistic of the Scottish gardener, his worth and work, performed the opening ceremony.

A survey of the exhibits showed there was not much evidence of the backward season, although, here and there, the deteriorating effects of the weather during April, May and June could be seen. There were 246 classes in all, seventy of which came under the heading professionals, although open to all-comers.

Pot plants formed an attractive feature, and here leading places were taken by LADY NICHOLSON of Eden, Banffshire (gr. Mr. James McLennan). It was in the cut flower classes, however, where competition was keenest, and especially for Sweet Peas.

The Silver Cup offered by the Society for twelve vases of Sweet Peas, distinct, was won by Mr. JAMES McDONALD, Cairnfield House Gardens, Buckie, for remarkably fine flowers. Prominent among the other winners for cut flowers were Mr. R. PAUL, Duff House, Banff; LESSENDRUM HOUSE (gr. Mr. James Munro);

Mr. A. CHALMERS, Tillynaught; LADY NICHOLSON, Eden House; Mr. J. FINDLAY, Park, and Mr. W. M. MILNE, Turriff.

Fruit was not extensively shown, but the few exhibited were good. The finest were from the gardens of Cairnfield House, Eden House, Gellymill (gr. Mr. John Fraser), Mountblairy House (gr. Mr. W. A. Munro), and the Fife Arms Hotel, Banff (gr. Mr. A. Craib).

Vegetables formed a strong feature, both in the professional and amateur classes. In the former classes capital produce was shown from the gardens at Kingswell, Banff (gr. Mr. John Bruce); Eden House, Cairnfield House, Tillynaught House, Mountblairy House, Bogmurchals (gr. Mr. G. S. Aitken), and Lessendrum House. In all respects the show was a remarkably successful one; the general standard of quality was exceedingly high, the attendance of visitors good, and those who assisted to this end deserve hearty congratulations.

ROYAL HORTICULTURAL.

Awards to Daffodils.

THE following awards have been made to the undermentioned Daffodils by the Royal Horticultural Society after trial at Wisley.

AWARDS OF MERIT.

Division 1 (a).—*Sulphur*, sent by Mr. P. D. WILLIAMS.

Division 2 (a).—*Grenade**, sent by Mr. W. B. CRANFIELD.

Division 2 (b).—**H. M. Queen Alexandra*, sent by Messrs. W. A. WATTS.

Division 3 (a).—*Treskerby†**, sent by Mr. P. D. WILLIAMS.

Division 3 (b).—*Sunrise†*, sent by Messrs. W. A. WATTS.

Division 4 (a).—*Duncan†**, sent by Mr. P. D. WILLIAMS; and *Mavourneen*, sent by Messrs. W. A. WATTS.

HIGHLY COMMENDED.

Division 1 (a).—*Refined Gold*, sent by Messrs. J. R. PEARSON AND SONS; A. W. Tait, sent by Messrs. BARR AND SONS; and *Florists' Delight**, sent by Mr. G. L. WILSON.

Division 2 (a).—*Egrin**, sent by Messrs. W. A. WATTS; *Bonaparte*, sent by Messrs. BARR AND SONS; and *Jubilant†*, sent by Mr. P. D. WILLIAMS.

Division 2 (b).—*Amber*, sent by Mr. W. B. CRANFIELD.

Division 3 (a).—*Nanny Nunn*, sent by Messrs. BARR AND SONS.

Division 4 (a).—*Norah Pearson*, sent by Messrs. J. R. PEARSON AND SONS.

Division 4 (b).—*St. Ilario*, sent by Messrs. J. R. PEARSON AND SONS.

Division 5 (a).—*Venetia*, sent by Mr. W. B. CRANFIELD.

Division 8.—*Glorious†**, sent by Mr. J. RICHARDSON; and *Chineta*, sent by Mr. L. DE ROTHSCHILD.

Division 10.—*Double Cheerfulness*, sent by Messrs. J. B. VAN DER SCHOOT.

COMMENDED.

Division 1 (a).—*Harvester*, sent by Mr. P. D. WILLIAMS; *Siegfried*, sent by Messrs. BARR AND SONS.

Division 1 (b).—*Mendip*, sent by Messrs. H. CHAPMAN, LTD.; and *Parth*, sent by Mr. P. D. WILLIAMS.

Division 1 (c).—*White Conqueror*, sent by Mr. G. L. WILSON; *Hawthorn*, sent by Messrs. H. CHAPMAN, LTD.

Division 2 (a).—*Breila**, sent by Messrs. W. A. WATTS; and *Yellow Standard**, sent by Messrs. BARR AND SONS.

Division 2 (b).—*Steadfast*, sent by Messrs. J. R. PEARSON AND SONS.

Division 3 (a).—*Owen*, sent by Mr. W. A. WATTS.

Division 4 (a).—*Tunis**, sent by Mr. P. D. WILLIAMS; and *Vega**, sent by Messrs. J. R. PEARSON AND SONS.

AWARD OF MERIT.

Division 6.—*Beryl**, sent by Mr. P. D. WILLIAMS.

* For rock garden. † Recommended for market.

Obituary.

Arthur Garnet.—It is with the deepest regret we learn of the tragic death of Mr. Arthur Garnet who was associated with Kew Gardens for many years, where he worked as an assistant in the Curator's office with the late Mr. William Watson. His death occurred through drowning whilst bathing off the Dorset coast, near Bridgport, on the 12th inst. When he left Kew in 1915, he settled in Tasmania as a fruit farmer, but he only remained in that island eight years. He was a son of the late Richard Garnet, Librarian to the British Museum, and was widely known in literary as in gardening circles.

Alexander Hill Gray.—This veteran rosarian died at his home, Beaulieu, Newbridge Hill, Bath, on the 20th inst., aged ninety-one. After a life of travel and adventure he settled at Beaulieu and engaged in the growing of Roses, in which he was very successful, especially with Tea and Noisette varieties. He won the Challenge Trophy of the National Rose Society, of which he was a Vice-President, offered for Tea and Noisette varieties, on many occasions. The beautiful Rose named after him by Messrs. Alex. Dickson and Sons, is a favourite Tea variety, and will serve to perpetuate his memory as a rosarian.

ANSWERS TO CORRESPONDENTS.

ANTIRRHINUMS DISEASED.—*M. F. B.* The fungus attacking your Antirrhinums is *Cercospora Antirrhini*, which was described in *The Gardeners' Chronicle*, Vol. LXVIII, 1920, page 158 and in Vol. LXXXVI, 1924, page 150. It is a most destructive disease of the "Shot-hole" type, and is greatly in evidence during cool summers, but not nearly so prevalent in hot summers, inasmuch as a comparatively low temperature is needed for the germination of the spores. Early spraying with a fungicide is recommended as a preventive measure. Diseased plants should be burned.

SPORES OF POTATO BLIGHT.—*C. A.* The spores of the late blight of the Potato (*Phytophthora infestans*) are very short lived and cannot pass the winter anywhere. The near relatives of this fungus produce two kinds of spores, namely, conidia and oosperms. The Potato disease produces only conidia, which are spores that must be able to grow quickly (say within a few days) or die. Oosperms or resting spores, are capable of resting through the winter and growing again in spring. The Potato disease does not produce these, or they are so rare as to be negligible. The conidia, or short-lived spores, are produced in myriads upon the leaves and enter the latter by the stomata or small openings, or they can penetrate the skin. When once inside the leaf they grow into long threads (mycelium) that rapidly pass through the leaves, and down the stems into the tubers. Patches of the pale brown disease may be found in the centre of Potato tubers, and these have evidently come through the stem. Other tubers may be found with broad patches of the disease directly under the skin. The disease in this case results from spores which have fallen on the soil and been carried down directly to the tubers by rain. The spores (conidia) germinate and grow through the skin of the Potato. Many diseased Potatoes are planted in spring and the mycelium or threads of the fungus commence to grow up the stem as that develops, and when the temperature has risen sufficiently high, and wet weather occurs, the disease breaks out as rapidly as ever. Thus the disease is carried through the winter in the living tubers, and possibly also in the dead haulm, which should, therefore be burnt. Disease in the centre of tubers cannot be detected at planting time.

REMARKS.—Chrysanthemums show a gradual improvement in quality and are becoming more attractive. A few boxes of Roi d'Blanc have been on sale during the past week, also some disbudded blooms of Mercedes (yellow) and Holicot Yellow. Of bunch blooms, bronze sorts are the most plentiful, the varieties Phoenix and Mrs. J. Pearson arriving in good condition. The yellow sorts include Horace Martin. All outdoor blooms have suffered from the heavy rains, and Asters and Stocks are arriving in a very poor and damaged condition. Prices for Carnations and Roses had a tendency to harden this morning, the former ranging from 9d. to 3s. 6d. per dozen. Of Roses, Madame Butterfly, Ophelia, Golden Ophelia Roselandia

and Madame Abel Chatenay are the best sorts available at the present time. The newest subjects in this department are single Asters and Physalis. With the exception of Smilax, the quantities of all foliage exceeds the demand.

REMARKS.—Conditions in the fruit trade during the past week have been anything but good, except for isolated lines in the section handling fruit of the highest grade. Practically all kinds of Plums have sold well during the past week but supplies have not been heavy. The variety Czar is finishing at a good price. Victoria has sold particularly well, and the few English Gages available are finding a ready market. English Apples are, at the best, only a moderate trade; a fair demand rules for well-coloured fruits of Worcester Pearmain and a quiet demand for well graded, large cookers, other than the above-mentioned Apples are a very bad business. Clean, sizeable Williams's Bon Chrétien Pears from the Continent are selling freely and making a fair price but here again second class fruits are not wanted. The Tomato trade is showing signs of some improvement, mainly due to reduced quantities, owing to lack of sunshine. Cucumbers are plentiful and cheap, unduly so for the time of year. Choice fruits, such as Peaches, Grapes, Nectarines and Figs are a quiet but steady trade. Mushrooms are not plentiful and prices are holding up fairly well. Peas are selling satisfactorily but their prices are on the low side. French and Runner Beans, Marrows, and most other vegetables are abundant and cheap. It is probable that every section of the trade would benefit from a spell of fine weather.

GLASGOW.

Business in the cut flower department was again quiet last week, and prices continued cheap with the exception of Chrysanthemums. Gladioli were difficult to sell and only made from 6d. to 1s. 6d. per dozen spikes. Carnations were worth from 1s. to 1s. 6d. per dozen; pink Roses, 1s. to 2s., and white Roses, 1s. to 1s. 6d.; Sweet Peas and Marguerites realised 1d. and 2d. per bunch; Stocks, 4d. to 6d.; Asters, 2d. to 4d.; Lilium rubrum and L. longiflorum (Harrissii), 2s. to 2s. 6d. per dozen; and Asparagus, 9d. to 1s. per bunch. Early Chrysanthemums were more plentiful; Constance sold at 1s. to 1s. 6d. (6's) No. 1 White at 1s. to 1s. 3d.; Elsie Heady and Holicot Yellow, at 1s. to 1s. 2d.; Phoenix at 1s. to 1s. 6d. per dozen, while small sprays realised 2d. to 6d. per bunch.

The volume of business done in the fruit market was quite up to the average at this season. The prices of Strawberries fluctuated between 6d. and 1s. per lb.; Raspberries, 6d. to 9d.; Black Currants, 10d. and Red Currants, 3d. Gooseberries realised 2s. to 2s. 6d. per sieve; Victoria Plums, 14s. to 16s.; home-grown Peaches, 4s. to 6s. per dozen; and Muscat Grapes, 4s. per lb. English Apples (Lord Derby and Warner's King) sold for 9s. 6d. per bushel; Keswick Codlin, 24s. per cwt.; Belgian Apples, 11s. 6d.

to 14s. per keg; Belgian Wine Pears, 10s. to 12s. 6d. per keg; Clapp's Favourite, 8s. to 9s.; Cherry Pears, 6s. 6d.; double Philips, 5s. 6d. to 6s. 6d.; French Williams's Bon Chrétien, 16s. per crate; and Damsons, 13s. per half sieve. Prices of South African Oranges were unchanged.

In the vegetable section prices for Scotch Tomatoes were firm at 9d. per lb.; Dutch Tomatoes made 2s. 3d. to 3s. per box. Other prices were: Celery, 4s. per box; Cauli-flowers, 5s. to 7s. per dozen; Lettuces, 1s. to 1s. 6d. per dozen; Cucumbers, 4s. to 6s. per dozen; Peas, 12s. to 14s. per pot; and locally-grown French Beans, 8d. per lb.

THE WEATHER IN JULY.

This was a very remarkable month of watery, sky-haziness, and extremely light south-easterly winds, instead of the usual fairly strong westerly breezes and dark blue skies, characteristic of July at Southport. As usual, the place escaped all serious thunderstorms, and, indeed, the rainfall did not quite equal the average, being only 2.88 inches, instead of a normal 3.02 inches. But humidity was very high, and the sun frequently only dispersed the clouds and mist for a few hours during the afternoon. Before noon, only 50 hours of sunshine were recorded, but, fortunately, after noon, 92 hours were experienced, the local sea-breeze often then prevailing. Much the driest time was from 2 p.m. to 6 p.m. (G.M.T.). Soon after then gloom or mist returned, and the nights and mornings were singularly cloudy and dark. Evaporation was much reduced. The moderate rainfall, too, was distributed over 19 days, or five more than the average number. The mean temperature was 61°, or 1½° above normal; but the highest maximum reading was only 73°. The deficiency of sunshine was 61 hours, an amount never approached in any July—except that of the notable volcanic-dust summer of 1912—but then both mornings and afternoons were similarly affected, and the haze was strongly coloured—conditions entirely different to those experienced during the month under review. Joseph Basendell, Borough Meteorologist, The Fernley Observatory, Southport.

THE LATEST TRADE MARKS.

THIS list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of His Majesty's Stationery Office.

MITHAYRION.

479,663.—Agricultural and Horticultural Machinery and Parts of such Machinery.—Ernest Everard Gates, Old Buckenham Hall, Old Buckenham, near Norwich, Norfolk, and 8A, Carlos Place, London, W.1. August 10.

MITHAYRION.

479,668.—Cutlery and Edge Tools, Ernest Everard Gates, Old Buckenham Hall, Old Buckenham, near Norwich, Norfolk, and 8A, Carlos Place, London, W.1.—August 10.

BEN HUR.

481,452.—Cutlery and Edge Tools.—Hugo Herkenrath, 16, Moltkestrasse, Merscheid, (Rheinland), Germany. August 10.

MITHAYRION.

The Winter Killing of Market Garden Crops.

A VERY useful example of the successful application of scientific knowledge to a practical cultural problem is provided by Mr. T. Wallace's account* of his treatment of market gardens in the neighbourhood of Bristol, in which crops of winter vegetables were suffering from winter-killing. The method of cropping practised in these gardens is to grow Celery, Marrows and plants of the Cabbage tribe during the summer and to follow them with Onions, Lettuces and spring Cabbages for the winter months. In many of the older gardens in which this system of cropping is practised it was found that the winter crops suffered severely during spells of hard weather; so serious, indeed, were the losses that growers were considering the abandonment of their gardens and removal to fresh ground where, as observation shows, the winter-killing is far less severe. Examination of the plots on which the winter crops were in poor health revealed the fact that there was something radically wrong with the nutrition of the plants. They lacked a vigorous root-system and so marked was the lack that the poorer of the plants were

easily pulled out of the ground. Other symptoms, even more significant, were a scorched appearance of the edges of the leaves of Cabbages and Lettuces, and a dying back of the tips of the leaves of Onions. This state of affairs was observed on soils of widely different geological origin; for example, soils derived from the clays of the Lower Lias were no better than those of Sandstone origin. The symptoms just described would suggest to anyone conversant with the effects of manurial deficiency on plant growth that the cause of the trouble was to be sought in this direction. Mr. Wallace was, indeed, the very man to undertake this investigation, for his well-known and valuable observations on fruit trees had already convinced him that where the relation between soil nitrogen and potash is too wide—that is, where there is a deficiency of potash in relation to nitrogen—plants suffer from leaf scorch, and a poorly-developed root system. So marked, indeed, is the effect of this lack of balance between these two plant foods that the plants subjected to it may actually grow worse than those to which no fertilisers of any kind have been applied. Confirmation of this view of the origin of the trouble was obtained from enquiry into the method of manuring practised by the market growers. The enquiry elicited the fact that it is the practice of the growers to give heavy dressings of stable manure to the summer crops. So much as forty loads to the acre, and in many cases considerably more, were applied. It is evident that dressings so large as these continued over a period of years might lead to a large accumulation of nitrogen in the soil, and that if no steps were taken to replace the potash and phosphates removed from the soil by the crops, a serious lack of balance between nitrogen and other nutrients would be established. Analysis of the soil showed, in fact, that although there was a large amount of lime (5.85 per cent.) present in the soil, the amount of available potash was extremely low, 0.0410 per cent., whereas phosphates appeared to be present in fairly adequate quantity (0.1838 per cent.). The remedial measure was therefore clearly indicated, namely, a liberal application of a potassic fertiliser. Accordingly, a dressing of sulphate of potash at the rate of 3 cwt. per acre was applied to part of one of the suffering gardens in which Lettuces were grown, and a similar dressing was given later on—at the time of planting Onions. The results were eminently satisfactory and entirely convincing. On the treated plot there were none of those fatal symptoms of poor root development and withered leaf-tip which characterised the plants of the untreated plots, and it is therefore to be concluded that the failure of the market garden crops through winter-killing was due to lack of potash in the soil, or rather to an improper balance between the amounts of nitrogen and potash therein. The experiment has wide bearings. Too many growers pin their faith too absolutely to farmyard manure. Best of all fertilisers, farmyard manure is poor in potash and phosphates and must be supplemented by dressings of these fertilisers. In the case in point it was not the large amount of nitrogen in itself which was doing the harm, but rather it was that with insufficiency of potash the nitrogen of the manure was useless and even harmful. Yet when potash was supplied, this nitrogen, although present in such large amounts, was no longer harmful but beneficial. The moral, therefore, is use all the farmyard manure that can be obtained, but see to it that there is added to it a sufficiency of potash and also of phosphatic fertilisers. The good

gardener makes ample use of basic slag and of potash salts in exploiting and supplementing the fertilizing virtues of the manure heap.

Illustrated Guide to Kew.—A new edition of the *Illustrated Guide to the Royal Botanic Gardens, Kew*, has been published by H.M. Stationery Office. The book is printed on art paper in double-toned ink, with very pleasing results. The opportunity has been taken to change several of the full page illustrations and a number of small pictures have been inserted in the text. These latter show plants of particular interest, such as *Amorphophallus Titanum*, the giant Aroid from Sumatra, which flowered at Kew last year; and *Angraecum sesquipedale*, an Orchid with a nectary up to one-and-a-half foot in length. Other interesting subjects illustrated include *Strelitzia Reginae*, *Nepenthes mixta*, *Sarracenia flava* and *Callistemon citrinus*. A useful index has been added. The book can be obtained from the Royal Botanic Gardens, Kew, price 1/- (by post, 1/2d.), and is excellent value for the price, as, in addition to the thirty full-page views—each seven inches by four inches—it contains a key plan of the gardens, and a great deal of historical information concerning this great national horticultural and botanical institution.

Memorial to Canon H. Coste.—Time and again clergymen have combined the cure of souls with a passion for botany or horticulture. The late Canon Hippolyte Coste was one of many examples of such a combination of interests. He died in 1924, when sixty-six years of age, and although honorary canon of Rodez, the whole of his life as a priest was spent in the little French village of St. Paul des Fonts, in Languedoc. Even as a lad he was interested in the flora of his district, and before entering the Petit Seminaire he had made a collection of three hundred specimens of native plants. In later life he devoted his holidays and other spare time to the collection and determination of native plants, and, with the approval of his Bishop and encouraged by scientific societies, he extended his botanical researches into the Pyrenees, the Alps and Corsica. He accumulated a vast amount of material and the herbarium he bequeathed to the Society of Literature and Science of Aveyron contained nearly 20,000 specimens, collected, classified and named by himself, with the place, date and altitude at which each specimen was found. His fine herbarium and wide knowledge formed an excellent foundation for his life work—the publication of *Flore descriptive et illustrée de la France la Corse et des contrées limitrophes*. This great work in three volumes contains over 5,000 descriptions and 4,354 illustrations of plants, and was published in Paris in 1900-1. A monument to the memory of this savant has been erected in the village of St. Paul des Fonts, and, at its dedication, the Mayor, the Bishop of Rodez and M. Emile Borel, representing the Academy of Science, paid tribute to the fine botanical work carried out by Canon Coste.

National Rose Society's Autumn Show.—The Society's Great Autumn Show will be held again this year in the Royal Horticultural Hall, Vincent Square, the dates fixed for the exhibition being Friday and Saturday, September 9 and 10. This annual exhibition is invariably of great interest, and usually extensive. We understand that competition in the artistic classes is likely to be very keen this year, and some very attractive exhibits are promised.

Uvedale's Enfield Cedar.—A very interesting horticultural antiquity is fated, it appears, to go the way of so many others—the old Cedar of Lebanon planted by Dr. Robert Uvedale in the garden of Enfield Palace is to be cleared away, together with the building, and the site is to be built over. The tree is still standing, and though it looks rather ill and has to be supported in several places, it is alive, and has a very picturesque appearance seen against the red-tiled roof of the old Palace. The house and garden are

* An Experiment on the Winter Killing of Vegetable Crops in Market Gardens, by T. Wallace. Annual Report of the Agricultural and Horticultural Research Station, Long Ashton, Bristol, 1926.

very much out of repair, and the house has been condemned as unsafe. It has been used until recently as the home of the local Conservative Club, but the Club is to build new premises elsewhere, and the Palace, which occupies what is now valuable ground in the heart of the town, has been marked for destruction. The garden at the back, in which the Cedar is planted, is still fairly open, but in the front two large buildings have already been erected in such a way as almost to conceal the Palace, which is reached by a narrow pathway from the High Street. Part of the building dates back to the time of Edward VI, and is of the characteristic Tudor brick. Many efforts have been made to save this old building and the Cedar from destruction by a small group of public spirited local antiquaries, but their efforts have, unfortunately, not availed, and unless energetic action is immediately taken, their days are numbered. It seems excessively regrettable that this should be so, as the original portion of the house, and the garden containing the Cedar, could be repaired and kept in order for a comparatively trifling amount. It is probable that the first Sweet Peas sent to England were grown in this garden, as it is on record that Franciscus Cupani sent seeds to Dr. Uvedale in 1689, and the resulting plants flowered in the following year.

State Experiment Station in Hessen.—The Hesse (Germany) Chamber of Agriculture has erected several forcing houses for Tomatos and Cucumbers, which will be in use during the present year. The houses have been erected on the Chamber's experimental grounds at Gr.-Umstadt, Odenwald, and the Director is Herr Reussrath; in addition to Tomatos and Cucumbers, Grapes are to be grown. The demonstrations made at the Experiment Station are found very helpful to the growers in the district, and play no small part in the extension of the trade.

Home Aquarium Exhibition.—The British Aquarists' Association is holding a home-aquarium exhibition at Chelsea Polytechnic from September 6 to 10. The show has been organised with a view to demonstrating the value of aquatic plants in maintaining a "balanced" aquarium (independent of change of water or artificial aeration). The exhibits will include some new cultivated varieties of wild aquatics which have been specially raised with a view to their suitability for aquaria. Full particulars concerning the exhibition may be obtained from the Hon. Secretary, Show Committee: Mr. A. W. Croser, 12, Winkfield Road, Wood Green, N.

Imported Apples and Pears.—It is announced that applications for an Order in Council under the Merchandise Marks Act, 1926, to require the marking of imported fresh Apples and Pears, have been referred, for enquiry, to the Standing Committee set up under the Act by the Minister of Agriculture and Fisheries, the Secretary of State for the Home Department, and the Secretary of State for Scotland, acting jointly. A further notice will be issued with regard to the date of the enquiry. Any communications with regard to the matter should be addressed to Mr. H. J. Johns, Secretary of the Standing Committee, 10, Whitehall Place, London, S.W.1.

British Mycological Society's Annual Meeting and Foray.—Aviemore, Inverness-shire, is the place fixed for the annual meeting of the British Mycological Society, and the centre for the Society's thirty-first Autumn Fungus Foray. The Annual Meeting will take place on Wednesday, September 14, at 8.45 p.m. For members who arrive at Aviemore in time, a special excursion will be arranged for Monday, September 12, to be followed in the evening by a meeting of the Council. On Tuesday, September 13, Rothiemurchus Forest will be visited, and in the evening Dr. E. J. Butler will give his presidential address. Rothiemurchus Forest will be visited again on Wednesday, September 14, and on the following day, after a visit to Abernethy Forest, Dr. Malcolm Wilson will lecture on the "Life History of Malesina Kriegeriana and its occurrence in Britain," and Dr. G. G. Hahn will discuss "Species of Phomopsis occurring on Conifers

and their distinction in culture." On Friday, September 16, there will be an excursion to the woods between Aviemore and Carr Bridge; during the evening Miss M. Wilson will lecture on "The Dutch Elm Disease," and Mr. Carlton Rea will make observations on "Fungi found during the Foray."

Professor A. G. Tansley, F.R.S.—The recent appointment of Mr. A. G. Tansley, M.A., F.R.S., to the Chair of Botany in the University of Oxford was yet another instance of the older University, with its imposing list of professors of botany from the time of Robert Morison in 1669, going to the sister University for its head of the Department of Botany. The present and the last two professors have all been Cambridge men. Sir Frederick Keeble followed Professor Vines in 1920, and Mr. Tansley has now followed Sir Frederick Keeble. It was William Sherard, sometime Consul at Smyrna, who endowed the Chair of Botany at Oxford (1728), and left his large herbarium and MS. of the *Pinax* to the University. Dillenius, who died in 1747, was the first Sherardian Professor, and his

PROF. A. G. TANSLEY.

herbaria at Oxford include type-specimens of the plants mentioned in the third edition of Ray's *Synopsis*, 1724. John Sibthorp was Professor 1784-95, and the Department not only possesses the type plants of the extremely valuable *Flora Graeca*, but numerous exquisite, original water-colour drawings by Ferdinand Bauer, which illustrated that sumptuous work. These paintings are as scientifically accurate as they are artistic. But it was Henry B. Fielding who, in 1851, bequeathed his herbarium of 80,000 specimens to Oxford and endowed the Fielding Curatorship, which has been held since 1895 by Dr. G. C. Druce. Professor Tansley has been in charge of the Department of Botany at Oxford since the beginning of February, and is a Professorial Fellow of Magdalen College. As a leader in the comparatively new science of Ecology, he is widely known, both in Europe and America; and he is specially anxious to co-operate so fully as opportunity permits, both in teaching and research, with the kindred departments of Forestry, Agriculture and Zoology. *Types of British Vegetation*, 1911, which Professor Tansley edited and largely contributed to, soon went out of print, and it is doubtful if any twentieth century botanical work published in this country has risen so much in price. In 1923 there appeared *Practical Plant Ecology*, a little work designed as a guide for British students to the practical study of vegetation in the field. In his *Elements of Plant Biology*, published in 1922, the new Professor has embodied his ideas of the nature of the instruction that should be given in the science

of plants to medical students and others who do not contemplate botany as a career. The general biological aspects of the subject and the physical and chemical foundations are specially emphasised. Of a man who edits both *The New Phytologist* and *The Journal of Ecology*, who founded the British Vegetation Committee (later developed into the British Ecological Society), who initiated the International Phytogeographical Excursions and conducted the first excursion through the British Isles in 1911, who has travelled widely in Europe, Ceylon, Malaya, Egypt, Algeria and North America, and held first the Assistant Professorship in Botany at University College, London (1893-1906), and then a University Lectureship in Botany at Cambridge, it need not be mentioned that he has had an extremely energetic and busy life. Professor Tansley's latest work is the editing, jointly with the Assistant Director of Kew, of a book on *Aims and Methods in the Study of Vegetation*, intended to stimulate and promote investigation of the natural vegetation of the Empire. Arthur George Tansley was born in 1871, and is the son of the late George Tansley, M.A., of the Working Men's College, then in Great Ormond Street, of which he was a mainstay for more than forty years. In early boyhood the son was interested in field botany by a wonderful old amateur botanist, Alfred Grugeon, of that College, who was by trade a wood-turner. Tansley then went to a private school at Worthing, where there was a master who was a field naturalist. This was the Rev. J. Harvey Bloom, since known for his sound archaeological work. Thence to Highgate Grammar School, whose head master wanted him to go to Oxford and study classics; but the lad insisted on leaving at seventeen in order to work at science, the school facilities for which were very poor. So he went to the University College, London, 1889-90, and Trinity College, Cambridge, 1890-93. In 1893, before he took his degree, Professor F. W. Oliver offered him an Assistantship in Botany at University College, and he was there in that capacity from 1893 to 1906, when he was appointed to the University Lectureship at Cambridge on Professor Seward's succession to the Chair of Botany. Professor Tansley's main research up to 1908 was in plant anatomy, and his first important publication was on the evolution of the Filicinean Vascular System. In 1923 he was President of Section K (Botany) of the British Association. On the Council of the Society for the Promotion of Nature Reserves Professor Tansley has been actively interested in the acquisition of suitable areas for protection by both this Society and the National Trust. The photograph we give shows him investigating the vegetation and other physical features of the Sharpham Moor Plot, near Glastonbury. Had it not been for Professor Tansley's keenness, encouragement and financial aid, this little enclosure of peat would not have been acquired for experimental purposes, and a Sedge (*Carex evoluta*) not known to grow elsewhere in the British Isles would by this time have been exterminated by peat-cutting. From what has been written, it is only to be expected that Professor Tansley should hold broad opinions, and be catholic in his outlook. A great educationist, terse in style, lucid in exposition, and quick in making decisions, he is sympathetic with all genuine efforts to do good work in every branch of botany, inspiring confidence and giving encouragement to others, without suffering fools more gladly than they deserve. May Oxford gain what Cambridge has lost! A particularly useful and well-illustrated article by Professor Tansley on "The Forests of Provence" was published in this journal in 1912, and reprinted as a quarto pamphlet.

Small holdings and Cottage holdings.—The Ministry of Agriculture has published particulars of a scheme whereby men and women with suitable qualifications may obtain small holdings and cottage holdings under the Small Holdings Acts. The definition of a small holding, according to these Acts, is one exceeding one acre, and either not exceeding fifty acres, or, if exceeding fifty acres, then not exceeding an annual value of £100 for the purposes of income tax. It may be either bare land or provided

with buildings, including a dwelling house. A cottage holding means a dwelling house, together with not less than forty perches and not more than three acres of agricultural land which can be cultivated by the occupier of the house and his family. Application for a small holding or a cottage holding should be made to the County Land Agent of the Council for the county in which the holding is desired. If the applicant resides in a county borough, application should be made to the Town Clerk. It should be noted, however, that Councils of County Boroughs have no power to provide cottage holdings. A successful applicant for a small holding will have the option of renting or purchasing it. On the other hand, an applicant for a cottage holding must be prepared to purchase the holding, as no provision is made for renting it. The consideration for purchase will be, as in the case of a small

Temple Gardens Exhibition.—A record number of entries has been received for the exhibition of London-grown flowers to be held at the Inner Temple Gardens, Victoria Embankment, on September 3, 4 and 5. The enthusiasm in connection with the recent Gardens Championships is being maintained. The exhibition is organised by the London Gardens Guild in conjunction with the *Daily Express*, and will include displays from well-known nurserymen and seedsmen, including a replica of the championship back garden by Messrs. J. Carter and Co. The most prominent feature will be a wonderful display of London-grown flowers by amateurs, including corporate displays as well as individual exhibits. As already announced, the exhibition will be opened on September 3 by the Rt. Hon. The Lord Lambourne, P.C., C.V.O., V.M.H., at 2.30 p.m. The presentation of prizes will take place on Monday, September 5,

meeting. SATURDAY, SEPTEMBER 10: Société Royale d'Horticulture et d'Agriculture de Bruxelles (nine days); Avonbridge Flower Show; Barrhead and District Flower Show.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Horticultural Society's Garden, Turnham Green.*—The fine trees of red Brugmansia in the large conservatory, which are every now and then so gay with flowers, have been pruned hard in, and their wood has been painted over with a mixture of clay, soft soap and Tobacco-water, with the view of keeping them clear of insects; *Hedychium Gardnerianum*, a Maize-like Gingerwort, bearing fine heads of yellow inflorescence, is now in blossom, and a valuable plant it is in the border of a conservatory at this season of the year. The heads of flower measure at least a foot long, and eight inches through. Among

FIG. 79. SOUTHPORT SHOW: MESSRS. W. H. GAZE AND SONS' JAPANESE GARDEN.
(see p. 198.)

holding, an annuity equal to the full fair rent of the holding for a period of sixty years, or, at the option of the purchaser, an annuity for a shorter period of equivalent capital value. The purchaser of a small holding provided by a Council may obtain from the Council or from a society under the guarantee of the Council, a loan for the purpose of enabling him to construct, alter or adapt a house or farm buildings on the holding. The Council must be satisfied that the case is in every way suitable, and, if so satisfied, may advance up to nine-tenths of the value of the borrower's interest in the property. Interim advances may be made as the work proceeds. Advances are repayable by instalments on terms arranged with the lenders. As an alternative to the purchase of a small holding provided by a Council any person desirous of purchasing an existing small holding from a private owner, who is willing to sell him the holding, may apply to the Council for an advance, and the Council may, if they think fit, lend him an amount not exceeding nine-tenths of the value of the holding.

at 6 p.m. Admission on Sunday is by ticket only, from 2.30 to 8 p.m.

Ex-Services Society.—The estate attached to Frederick Milner House, Ermyn Way, Leatherhead, Surrey, is to be developed on market garden lines by the Ex-Services Welfare Society, for the benefit of war-broken, ex-Service men. An appeal is made for gifts of garden plants, seeds, or anything that would be of use in connection with the scheme.

Appointments for the Ensuing Week.—SUNDAY, SEPTEMBER 4: Wakefield and North of England Tulip Society's meeting. MONDAY, SEPTEMBER 5: Romsey Gardeners' Association's meeting. TUESDAY, SEPTEMBER 6: Royal Caledonian Horticultural Society's meeting. WEDNESDAY, SEPTEMBER 7: Glasgow and West of Scotland Horticultural Society's show (two days); Nottingham and Notts. Chrysanthemum Society's meeting; Cardiff and County Horticultural Society's Show (two days). FRIDAY, SEPTEMBER 9: National Rose Society's show (two days); Dalry (Ayrshire) Flower show; Royal Horticultural Society of Ireland

flowering plants on the shelves we remarked some Continental Balsams of a large and fine description. In the large stove the huge *Laelia superbiens*, now familiar to most admirers of Orchids, is again throwing up flower stems which bid fair to be more numerous than in previous years, showing that when once a blooming habit is induced in this plant it will flower with certainty every season afterwards. The rare *Cinchona Calisaya*, from which the best kind of Peruvian bark is obtained, is now in full flower, for the first time, we believe, in Europe. Its clusters of pinkish, hairy flowers are extremely curious. A large example of the double purple *Hibiscus syriacus* is now in full beauty in the open border, where it is very ornamental, and *Ceanothus azureus* and its pale variety are in blossom on the conservatory wall; of the two the variety is the gayer, its flower spikes being larger than those of the species. The arboretum is still in full summer dress, and altogether the garden is quite as inviting, and even more enjoyable at the present time than it has been at any period during the whole season. *Gard. Chron.*, September 4, 1852.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,
Bletchley Park, Bletchley, Bucks.

Dendrobiums.—In spite of the shortage of solar heat, which is essential to the well-being of these plants, many of the deciduous and semi-deciduous species and hybrids of *Dendrobiums* are finishing their growth; when this has been completed, which may be seen by the full development of the terminal leaf at the apex of the new pseudo-bulb. When this is observed it is necessary to remove the plants to a cooler and drier atmosphere, where they may receive the benefit of extra sunlight and air to thoroughly bring the newly-made growths to maturity. It is not always advisable to remove the plants from their growing quarters immediately they appear to have finished their growth, for it is at this time that the roots become active, not only in lengthening themselves, but also in throwing out many lateral rootlets, whilst some kinds will develop roots from the bases of the newly-made pseudo-bulbs. Small as these matters appear, they are essential to success, as should these roots get injured by any means, the plants will lose much strength, and the flowers come small. It is better, where practicable, to select a position on one side of the house, where more air and light can be admitted, less moisture given, and the plants gradually exposed to the sun. This partial removal may take place immediately the leaf at the extremity of the new pseudo-bulb is completed, or where there is any fear of a plant starting into secondary growth. Should the latter have occurred, it is much the best practice to place the plant in the warmest position possible, and so enable it to finish this new growth at the earliest date. Plants that have completed their growths should not be allowed to suffer for want of water at the roots, as this may result in a check to growth which would cause them to finish prematurely and start into growth immediately afterwards. *D. Wardianum*, *D. crassinode* and some of their hybrids are very liable to do this, with the result that the flowers the following season are much inferior to those on plants that have received careful attention.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD
WAVERTREE, Horsley Hall, Gresford, N. Wales.

Parsley.—Where this herb was sown as I advised in a previous calendar, the young plants will now be ready for transplanting to their winter quarters, either in cold frames or in sheltered positions out-of-doors. Plant in rows made about one foot apart on well prepared ground enriched with a little old manure, also add a liberal sprinkling of burnt refuse from the garden fire. Keep the ground well hoed between the plants, and dust the latter frequently with old soot, which will act as a slight stimulant and also as a deterrent to slugs, which are often very destructive to young Parsley.

Tomatos.—Plants growing in houses and frames do not appear to be cropping so heavily as usual owing to the very wet, sunless weather of the past three months. Feeding the roots, especially with nitrogenous manures, should be done carefully; potassic and phosphatic manures will be more suitable. There is also a good deal of disease in some places and I advise that a greater amount of ventilation be given; never, at any time, should the atmosphere be allowed to become stagnant. Although I am not in favour of a drastic removal of the leaves, it will be found wise to cut away a portion of the foliage where it is too crowded, also to keep every side lateral pinched out. Secure the

leading shoots in position with strong, soft raffia, and be careful not to tie so tightly as to compress the stems. If white fly appears fumigate the house, either with cyanogas, or a reliable white-fly fumigant so soon as the pest is detected. Tomatos growing in the open are not a success this season, and only those planted on the sunny side of a wall or fence are making real progress. Where a good crop has set, remove some of the foliage in the neighbourhood of the bunches and stop the leading shoots.

Onions.—The crop of Onions raised from seeds sown under glass should be carefully watched, and so soon as the bulbs are fully grown they should be partly lifted with a fork. Raise one side only at the first operation, while the opposite side can be similarly treated a short time afterwards. By adopting this method it will be found that very few of the bulbs will split, but ripen gradually. Remove all loose skins at intervals, and by the time the bulbs are ready for taking inside they will require but little further attention. When harvested, great care should be taken not to bruise the Onions, or they will decay quickly. I strongly emphasise this point, having proved that with careful handling, these fine, well-grown bulbs, will keep equally as well as those of the smaller maincrop varieties. I have even kept them quite sound after the bulbs of late crops have deteriorated. At the time of harvesting these large Onions should be taken direct to an airy vinery or water-tight frame and laid carefully on wood-wool; they should be turned occasionally until they are perfectly ripe, at which time the necks will have almost disappeared, and if required for exhibition purposes may be tied neatly with raffia. Where frames or glass are not available the Onions may be tied in bunches of four and hung in a very airy, open shed, and although they will take longer to ripen, they will be found to keep equally well.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,
Brocket Hall, Hertfordshire.

Trachelium coeruleum.—This is becoming a most popular plant for greenhouse decoration. It develops large heads of pale blue flowers. The present is a very suitable time to sow seeds where flowers are needed in July next year. The seeds may be sown in pots or pans filled with a light, sandy compost, and covered very lightly with fine soil. Place the seed-pans in a cool greenhouse in which the seeds will soon germinate. Prick off the seedlings so soon as they can be handled, and grow them on near the roof-glass in a cool house or frame. This plant is not particular with regard to compost, but it resents a close atmosphere.

Bulbs.—To keep up a plentiful supply of flowers during the winter the grower has to rely to a certain extent on bulbs, especially after the turn of the year, when *Chrysanthemums* become scarce. Tulips and Narcissi are well-nigh indispensable, while Hyacinths and *Iris tingitana* are useful as pot plants. But perhaps the most important bulbous flower for cutting purposes is the *Narcissus*. The bulbs should be obtained now and either placed in receptacles five inches or six inches in diameter, or grown in quantities in boxes, if cut blooms and pot plants are in demand early in the year. It will be best to grow large batches of one or two kinds. Paper White Narcissi should be chosen for an early display, while Golden Spur, Emperor, Sir Watkin and King Alfred will form a good succession. There are many good Tulips, and one of the best is Prince of Austria. Darwin Tulips make a grand display, but no attempt should be made to force this type hard. A moderately rich rooting-material is recommended, the receptacles should be clean and well-drained, and the compost made fairly firm. Nearly all bulbs require similar treatment; they should be potted directly they are received and the pots plunged in clean ashes or leaf-mould to encourage roots to develop. When the bulbs have made sufficient roots and top growth

is evident, they should be removed to a frost-proof house or frame and afterwards grown in gentle warmth as required. Hard forcing is not to be recommended, for most bulbs resent this treatment, and failures may be traced to this error of cultivation alone.

General Remarks.—Plants of winter-flowering Begonias that were rooted late and are still in small pots should be transferred to larger receptacles as they become ready for this to be done. These Begonias resent over-potting, therefore care is necessary in this direction. Other plants that need potting are Poinsettias, which should be grown in pots of various sizes, ranging from sixties to thirty-two's. Grown in these pots they will be found useful for grouping. Continue to prick off the various kinds of annuals such as *Schizanthus*, *Godetia* and *Antirrhinum*, as they become ready, and grow them under cool conditions. Make another sowing to obtain plants for successional flowering.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,
Wrotham Park, Barnet, Middlesex.

Black Currants.—This crop has been fairly good this season, in fact, better than for the past three years. The bushes having been cleared of the fruits, the nets used against birds should be removed, the ground between the bushes hoed and weeded, and the latter pruned. It is a mistake to defer pruning until winter, especially where the bushes have made much growth and become crowded with shoots. Where the heads are well furnished with shoots cut out as much of the old wood as can be spared to allow air and light to reach the young growths that will fruit next season. Young bushes will not require much pruning, but the training of the heads should be attended to. Unhealthy, overgrown and much neglected bushes may sometimes be made to produce good crops by cutting them down to the ground in order to cause new basal growths to develop, and this may be assisted by applying a good mulch of rich manure over the roots and watering them occasionally with liquid manure.

Apples and Pears.—The gathering of these fruits will require the constant attention of the grower, for harvesting top fruits should be done at intervals as they become ripe. Sun and warmth are greatly needed to perfect these fruits. Protection against birds may be necessary, especially against the small blue tit, which will quickly damage many of the best dessert fruits. When the trees are trained on walls, nets may be used, but these cannot be employed on large trees in the open, where other means to preserve the fruits from injury must be adopted.

Gooseberries and Red Currants.—Where these fruits are grown as standards and pyramids see that they are well supported against strong winds. Cordon trees should not be overcrowded with useless growths. Tie the leaders in position and keep the foliage clean and free from red spider. Older trees growing on poor land should be fed with stimulants to promote health and vigour in the growth; liquid manure supplied liberally at intervals, or a liberal mulch of manure will prove highly beneficial to these fruits.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,
Ford Manor, Lingfield, Surrey.

Pot Strawberries.—Now is the time to make preparations for stock plants for another year. When the runners have made sufficient roots to prevent the ball of soil from falling to pieces they should be detached and planted at once. It may not always be convenient to transfer them direct to their permanent quarters, but an effort should be made to do so as the production of strong, early runners next year depends largely upon a good start now. The rooted

runners should be planted on the best prepared site in the garden, fully exposed to sun and light, and in no way associated with plants intended to yield a supply of fruit in the open. Another important matter is the regular introduction of new, healthy runners, as by this means the deterioration is kept in check; certain varieties appear to suffer more than others unless new stock is introduced. The cool, showery weather of July favoured root-development of the runners, but has encouraged the spread of mildew. Growth has been rapid since the plants were potted, and if they have escaped all checks, they should be making good progress. If mildew or red spider have been troublesome the foliage should be dipped in a solution of sulphur and the plants rearranged, giving them more room so that air may pass freely amongst them. Frequent changes of position are favourable to growth. Watering is an important operation, as Strawberries should never suffer from lack of moisture. Soft water is better than hard, but I incline to the belief that pot-bound plants should be regularly fed through August and September; much, however, depends upon the size of the pot and the quality of the compost. Weak soot-water and guano in solution may be used alternately two or three times a week, with occasional overhead syringings with soft water on fine evenings.

Frame Strawberries.—Anyone who has a surplus stock of maiden plants and a frame six feet in width and twenty feet in length, which will hold 120 plants, may steal a march upon the earliest open air beds, and assuming each of the plants produces half-a-pound of fruit, the work amply repays the trifling amount of labour and attention which this method entails. Any fairly rich Strawberry soil will answer well provided there is good drainage. When the frame is planted one watering will settle the soil and very little more attention will be needed beyond weeding, removing runners and watering should the autumn prove dry. Many gardeners and amateurs obtain good crops of Strawberries by this method, and provided the plants are kept not more than fifteen inches below the glass, they will do remarkably well.

Top-dressing Vines.—The best time to top-dress early vines is in September and should be done annually. All old mulching material and inert soil should be removed. When the surface roots have been laid bare the loose material may be carefully removed and fresh compost enriched with bone-meal and a little vine manure substituted to a depth of two inches. If a portion of the inside space eventually to be filled with compost looks unsightly it may be filled with fresh fermenting leaves, if not before, when the vines are started.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Anemone coronaria.—The many beautiful varieties of this Anemone, both single and double, are invaluable, not only for bedding, but also for supplying cut blooms. They are very accommodating plants, and by planting them at different times they may be had in flower over a long period; they are easily raised from seeds but at present I am only concerned with the dry roots, which are usually relied on to give a display in beds as distinct from those grown for a supply of cut flowers. Although they may be planted successfully over a long period for successional purposes, there is no doubt that for spring bedding early planting is best, say, during the later half of September or beginning of October. *Anemone coronaria* may be planted in beds or borders in rich, well-manured soil, and it is an advantage if the planting sites are prepared some time in advance of planting, as they do best in fairly firm ground. Care should be taken that they are planted the right side up; this advice is very necessary as young cultivators often find it difficult to distinguish the crown or growing point.

Planting Bulbs in Grass.—As the bulbs come to hand they should be planted, as this can be done before beds are cleared for replanting. Narcissi

suffer from being kept out of the ground for a considerable length of time and should be planted first. Bulbs should be planted in as natural a manner as possible; it is a good plan to scatter them in irregular drifts and plant them where they fall. Many other bulbous subjects may be used for naturalising in grass or under large beds of deciduous shrubs. Crocuses especially are excellent for planting under individual trees or groups of trees on lawns, for in such positions they get plenty of light and sun. Many of the smaller bulbous subjects may be used in various ways, including *Scillas*, *Muscari*, *Chionodoxa* and *Brodiaea uniflora* (syn. *Triteleia uniflora*).

Anemone fulgens.—This *Anemone* and its varieties are also very useful for a display in the garden and the flowers are ideal for cutting. The corms should be grown in rich, moist loam, and, in my experience, lime is beneficial. In common with *A. coronaria* and its varieties, *A. fulgens* enjoys a rich, moist loam, but stagnant moisture is fatal to success with them; thus,

permits keeps it not only free from weeds, but in a sweeter condition, and the plants respond by growing more regularly than they would do in soil that has become caked and hard on the surface.

Strawberries.—The first week of September is a suitable time in which to plant new beds or borders of Strawberries, and if the runners were prepared as previously advised by layering they should now be in good condition for removal to their permanent quarters. The ground should have been prepared thoroughly by double digging and manuring some time in advance of planting, so that it may have had time to settle. Many failures are recorded nowadays with the Strawberry crop, and disease has devastated many acres to the great loss of commercial growers, so that the best possible cultivation should be practised, and every means taken to stamp out the disease. Many interesting experiments are being carried out by the staffs of Agricultural Colleges throughout the country by means of controlled plots on which a

FIG. 80.—SOUTHPORT SHOW: MR. R. F. FELTON'S CHAMPION EXHIBIT OF FLORAL DESIGNS. (see p. 197).

in cold, wet, low-lying situations, the beds or borders should be raised somewhat above the general level.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Cabbages.—The main crop of this useful vegetable should be planted as early in September as possible, using plants raised from seeds sown in July, which are now of nice planting size. Plant in fairly firm ground. When the soil has been prepared it is advisable to draw shallow drills as for seed-sowing, and set the young plants in these at the requisite distance apart, putting the rows of the dwarfier and earlier varieties much closer together, and the plants themselves closer than in the case of the second early sorts, which, as a rule, make considerably more leaves before hearting. So soon as the young plants have recovered from the effects of transplanting and are again growing erectly, the ground between should be stirred deeply with the Dutch hoe or other cultivator, and the drills filled in around the necks of the plants, thus forming a partial moulding up which will support them and enable them to come through a series of autumn gales with very little injury. Stirring the surface soil frequently when the weather

variety of manures, fungicides, etc., have been applied, and the results when tabulated will, no doubt, prove of great interest to all concerned. The methods of cultivation have been entirely changed during the past thirty years, and whereas we are now recommended never to stir the surface of the Strawberry bed deeply, as by doing so much injury will be done to the surface roots, it was at one time the usual practice to set a line down each side of the rows, cut off the overhanging foliage and runners with a spade, and dig deeply between the rows, burying mulching materials and foliage in the process, and leaving the surface rough for frost and snow to sweeten it during the winter. The results from the old treatment were generally more satisfactory, so far as crops are concerned, than they are today. Strawberry plants intended for forcing should be transferred to their fruiting pots, filled with rich, heavy compost, containing wood-ash and bone-meal. The pots should be well-drained and set on a firm ash base, either in a cold frame with the sashes removed, or in the open, where watering, removal of runners, weeds, etc., may be attended to until such time as danger from frost threatens, when the pots should be buried to their rims in ashes or other non-conducting materials. Where other means have failed to give good crops, a trial should be given to the most promising of the newer sorts, which, among other good qualities, may have a great disease-resisting capacity.

FLORISTS' FLOWERS.

GLADIOLI OF MERIT.

SOME notes of the British Gladiolus Society's Show at Taunton on August 10 and 11, from the point of view of a florist and raiser of new seedlings, giving a selection of the flowers shown of special merit and originality, may be of interest. These are not necessarily all new, but possess novelty in the sense that they are, in their respective types, unsurpassed, at any rate by varieties flowering at about that date. Of the varieties shown, there were some thirty of outstanding merit and originality. This may seem few out of the many hundred varieties shown or in existence, and no doubt as many more could be added from among those that will flower later in the season. Flowers may also be considered with regard to their use for special purposes, such as massing for colour effect, for exhibition, and so on, and a selection to include all these would greatly increase the numbers, but such is beyond the scope of these notes. Those selected to be noticed here are of all-round outstanding merit in all characters, or novelties in colour and markings.

PURE WHITES.—The two best white varieties shown were Purest of All and Mt. Everest, the former with the faintest tinge of pink, perceptible only in the fading flower; the latter a slightly "colder" white, due to the faintest tinge of yellow in the fading flower. The chief defects in white Gladioli are narrow petals, especially the two lower inner segments, and consequent lack of balance. These two varieties have comparatively broad and rounded segments and good substance (for whites). There is some tendency for the petals to fold at the margins, Mt. Everest being rather the better in this character, with smoother and flatter petals.

WHITE WITH COLOUR IN THE THROAT.—Three varieties of about equal merit were Yvonne, Dorothy Kelway and Elora. Yvonne is, perhaps, the best on the whole (as shown); it is white, tinged with pink, with a fan-shaped blotch of pale crimson. The flowers are of fine, open form, with broad petals, and the spike is good, but not entirely regular. Dorothy Kelway also has flowers of fine, broad-petalled, open form, and the spike is very good. It is white, tinged pink, with a small speckled flush of pale carmine and yellow in the throat. Elora is practically the same as Yvonne, but with a smaller and weaker, broken blotch.

PINK AND ROSE.—Richard Deiner was far the finest in these colours. It has very large flowers of fine, broad-petalled, open form, coloured soft, clear salmon-pink, flushed deeper in the throat. Nimrod, shown by Mr. F. W. Ransome, has also large, open flowers of fine form, but the spike is a little short; the colour is clear, deep pink with a salmon tinge, slightly lighter in the throat. Panama may also be mentioned, it is still a first-class flower in form and colour, but a little colder in tone than those named above.

ROSE AND ROSE-RED.—There was no flower of this colour (rose) shown appreciably better than Groff's Dawn. The large, suffusing, carmine blotch gives a general effect almost of red rather than rose. Two other varieties, though classed as full reds, may be noticed here on account of their special colour. Louise, shown by Messrs. Velthuis and Co., and Scarlet princeps, shown by Mr. A. E. Amos. They are much alike, of the same type, and evidently of Cruentus descent in some degree. The form of the flowers is something like that of Panama, but more open, and with very smooth petals but more roundly tipped. Both sorts have well set spikes, but the stems are not very stiff as is often the case with Cruentus hybrids. The colour is a self-rose-scarlet (nearest to rose-dorée of Ridgway), Scarlet princeps being a little nearer to scarlet-red. They are not only fine flowers, but interesting as a distinct type.

RED.—Red Gladioli for purposes of comparison must be separated into light scarlet and deep scarlet or vermilion. Of the light scarlets Pfitzer's Triumph and Liebesfeur were undoubtedly the finest. Both are of beautiful colouring;

Pfitzer's Triumph is light scarlet, flushed with grenadine, with open flowers of fine form. Liebesfeur is a clear coral-scarlet, with a fine, though rather close-set spike of exhibition type. Of the two scarlet shades there were many shown, but with the exception of two of my own seedlings, Splendour and Cardinal, the latter being derived from Liebesfeur, all were more or less streaked with flakes of deeper colour or dull purple-red, or stained, especially at the edge of the petals, with slate or neutral tint. This is necessarily a bad characteristic from the point of view of the florist or breeder whose chief aims in colour are purity and brightness—and flaking is very difficult to eliminate. And where colours are blended, or where there is a contrast of two or more colours in a flower the aim is for harmony. The only colour with which this slatey-blue tone seems to blend harmoniously is rose, as in Rose Ash—certainly the effect when in conjunction with geranium scarlet is harsh. One arresting variety may be noted, King George. It has a towering spike with very large flowers of open form, and coloured clear scarlet, with a large, clear cream blotch, but the petals are margined with slate.

VIOLET-BLUE.—For more than twenty years Baron J. Hûlot has been without a rival in its colour. Now it is at last challenged by Sovereign, shown by Mr. W. E. Samuel, a very rich deep violet to purple-blue self. The flowers are of medium size, of fine, open papilio-type form, very well balanced and symmetrical. In contrast, Heavenly Blue, shown also by Mr. Samuel, is a pale self violet-blue. It is of the same type as the now well-known Mrs. V. Konynenburg, but the colours are clearer and more delicate, a little paler and bluer, and though the actual differences are slight, it is a more beautiful flower; indeed, I think, it was the most charming flower of the show.

YELLOW.—Of the deeper, or golden yellow primulinus selfs, of which several varieties were shown, Souvenir was the best. Mrs. Beatty, shown by Mr. E. Baines, had rather larger flowers with broader petals of a slightly deeper yellow, and might eventually prove better, but only one spike was shown.

PALE YELLOW AND CREAM.—Three varieties of Glory of Noordwijk type, and probably derived from it, were Belinde, Leviathan and La Lys, in order of merit. The colouring of all three is practically alike, pale cream-sulphur, the lower segments being a shade deeper. Leviathan, as shown by Messrs. Velthuis and Co., is the largest, but the spike is a little rough. This is due to it being composed of two types of flowers, the normal with two smaller inner segments, and the semi-peloriote or exhibition type with one small, inner segment. When this occurs, the flowers are necessarily somewhat irregularly disposed on the spike owing to the different degree of twist in the pips of these two types. For a perfect, regular spike the flowers must all be either of one or the other type. Belinde has a regular spike of flowers of fine form, and is also rather more uniform in colour. La Lys has the broadest petals but a shorter spike, and the colouring is of a more lemon tone. Elf may also be noted for its colouring, cream white suffusing to pale pyrethrum (greenish) yellow in the throat. It has a regular spike of open, broad-petalled flowers. Helioda is a distinct variety from the above, and was one of the outstanding flowers of the show; the colour is pale saffron-yellow, the inner segments being tinged deeper. The flowers are of fine, open form, but the spike is a little irregular (as shown) and the petals are slightly "ruffled," the inner ones especially. From this characteristic and the colour, I should expect that it is descended from the old Saffrano. By some this ruffling of the petal is not considered a fault, and it is not displeasing in moderation, but from a breeding point of view it is a detrimental—or at least, a dangerous—character, as it tends to give irregular and malformed flowers.

ORANGE (Primulinus).—A pure orange variety has long been sought for, and it now seems possible through a perfect blending of a golden yellow Primulinus with a clear red of the older varieties. But as yet that ideal has not been attained. The best orange Primulinus Gladiolus

grown was undoubtedly Orange Queen, which has comparatively large flowers of good form. The colour is not so rich or deep as in Xanthia, and it is not a perfect blend, much yellow showing in the throat, and it has a small red blaze. Sheila is a larger flower and better in form, but less "orange" and also has a distinct red median band on the lower petals.

I often consider that in the striving after mere colour and its natural outcome, the production of self-coloured flowers, breeders are neglecting the very great possibilities of variety and originality of markings and contrast, which are, after all, specially characteristic of the genus, and which deserve to be developed at least as much as self-colouring. Such flowers appeal to the great majority of those with comparatively small gardens, who have not the scope for "massing" and broad colour effects, and, whose interest is in the individual flower or variety. There were, of course, many flowers shown displaying markings, but very few in which these markings were of any special distinction, showing originality of type or arresting contrasts. Such as there were, had the appearance of being accidental rather than deliberately sought after for their own sakes. I may exemplify this in mentioning a few which owe their charm chiefly to the distinctiveness or contrast of the markings. Madame Mounet Sully has flowers of fine, broad and round-petalled form and clear cream-white, with a solid, defined blotch of grenadine red—a beautiful contrast. Unfortunately, it has a short spike and Incontestable (not shown) is a much finer variety in all but the special colour of the blotch. Another beautiful flower of similar type for which Messrs. Kelway obtained an Award of Merit is Rt. Hon. Countess Beatty. It has large flowers of fine, open Childsii form, clear white, with large, defined, crimson-ruby blotch. Lady Muriel Digby (Kelway) is another beautiful variety which owes its charm largely to the harmony of colouring of the markings. The ground colour is a soft cream shading to pale citron, with a "spotted" blotch of bright red on a pale yellow suffusion. Another variety that may be noted, of quite a different type to these, is Gipsy Girl; the colour is rich deep blood-red, the lower petals being almost entirely covered with thickly-sown spots of the same colour. It is this marking which gives a distinction to the flower which otherwise would be only an ordinary good, deep red variety. A. J. Bliss.

BULB GARDEN.

ALLIUM SPHAEROCEPHALUM.

AN old bulbous plant, greatly neglected, was honoured with an Award of Merit by the Floral Committee of the Royal Horticultural Society, on July 27, of last year. It was exhibited by Mr. R. C. Notcutt, and the name given in the R.H.S. "Transactions" is *A. sphaerocephalum descendens*. I am not at present able to refer to the *Index Kewensis* regarding the name, but I am of opinion that *descendens* is either a synonym or refers to a separate species. In one modern book of reference both *A. sphaerocephalum* and *A. descendens* appear as distinct species, the latter being described as one foot high and as a native of Switzerland, whilst *A. sphaerocephalum* is given as two feet high, and a native of southern Europe. I have known this plant for very many years, and first grew it as *A. sphaerocephalum*, but this was called in question, and the plant was said to be *A. descendens*. Personally, I am inclined to consider that the two names represent one plant. The name of *descendens* is applied because the flower heads open at the apex, and the lower florets gradually expand until the whole head is of a rich purplish-red.

Although it shares to some degree the odour of the other Onions, which is so objectionable to many, it is a worthy plant, as may be gathered from the fact that that accomplished author and gardener, Sir Herbert Maxwell, informs us that *A. sphaerocephalum* is his favourite amongst the *Allium* species. Sir Herbert speaks highly

of this *Allium*, with its rounded head, which opens after the leaves die off, and has tall, slender, yet strong stems from two to three feet high. He also tells us how the bumble bees frequent the flowers and sleep lazily on them. This is an attractive feature of the plant and adds to its interest in the garden. It is easy to grow almost anywhere, but the fact that its leaves die off so early would suggest that *A. sphaerocephalum* should be planted where it will rise through some carpet. Bulbs are procurable, and may be planted in autumn, at a depth of three or four inches. Whatever differences of opinion may exist regarding its claim to the distinction it received, there is no doubt that *Allium sphaerocephalum* is worthy of inclusion in the garden, where late-flowering bulbs of distinct appearance are desired. With me it flowers in the end of July and through August. *S. Arnott.*

States in 1918. "*S. koreana*, Nakai, a tree up to forty-five feet in height."

Judged by the positions where we have them thriving best at Kew, and in other gardens I have visited, the *Stuartias* should be given positions sheltered from north and east winds. They are obviously partial to a cool, moist soil, and for this reason, at least in their early years of growth, should be planted in large beds and borders where vegetation affords shelter to the plants and shade to the ground beneath.

A well-drained soil being desirable, the ideal ground for *Stuartias* would appear to be a light loam with peat and leaf-mould added when preparing the stations for planting. Though deciduous shrubs, plants of considerable size are not easy to transplant successfully, except with large balls of soil. For this reason the *Stuartias* should be planted in their permanent positions when young, with other plants growing

twenty feet in height, at Iver Heath, near Stoke Poges. This *Stuartia* is a native of the coast regions of the south-eastern United States, and no doubt because of this Cavanilles described it as *S. virginica*, a name under which we several times find it noted by horticultural writers during its long, but somewhat chequered associations with British gardens. It is figured in the *Botanical Magazine*, tab. 8, 145.

S. pentagyna, L. Hér., designated the five-styled *Stuartia* in the *Botanical Magazine*, where it is figured in tab. 3, 918, is the largest-flowered species of the genus, and also has the largest leaves. It is a native of the southern United States, an old inhabitant of British gardens, but still far from common.

It is a wide-spreading shrub from eight feet to twelve feet or more in height and broader than high. The leaves are ovate, up to five inches long and about half as wide, with serrate

FIG. 81.—STUARTIA MALACHODENDRON.

TREES AND SHRUBS.

STUARTIA.

THIS genus of large deciduous shrubs or small trees has botanical affinities with the wild *Camellias*. Both belong to the Natural Order *Ternstroemiaceae*, but the *Camellias* are evergreen and the *Stuartias* deciduous shrubs.

The genus is spelt *Stewartia* by some authors, but as it is named in honour of John Stuart, the Earl of Bute, who acted as chief adviser to Augusta, Princess Dowager of Wales, when she founded the Botanic Garden at Kew, in 1759-1760, the desirable spelling to use would seem to be that at the head of these notes.

The genus *Stuartia* is interesting as being another example of the close affinity of the flora of China and Japan and that of the United States. Of the species cultivated in British gardens, two, and one variety, are from the eastern United States, two from Japan, and one from China.

I do not think that the true Japanese species *S. monadelphica* is now in cultivation; the few specimens that I have seen so named are Wilson's Chinese introduction, *S. sinensis*.

Rehder, in his recently published *Manual of Cultivated Trees and Shrubs*, describes a new species from Korea, introduced to the United

temporarily around them to furnish the ground and afford protection to the young *Stuartias*.

Seeds, when available, layers and cuttings, provide ready methods of propagating *Stuartias*.

The illustration reproduced in Fig. 82, depicts a rooted cutting of *Stuartia Malachodendron* inserted in a sand frame, with slight bottom heat, in a propagating pit. The cutting was inserted on July 21 and photographed on August 19.

S. Malachodendron (Fig. 81), is a deciduous shrub or rarely a small tree, eight feet to probably more than twenty feet in height. The leaves are ovate or obovate, two inches to four inches long, five-eighths inch to two inches wide, minutely toothed, bright green above, paler beneath, and hairy on the under side. The flowers are the most beautiful in the genus, two-and-a-half inches to three-and-a-half inches across, white with a central cluster of attractive purplish anthers; solitary in the axils of the leaves. During July and early August, well established plants flower freely and are amongst the most interesting and showy of rare shrubs, flowering after mid-summer.

Though Mark Catesby has placed it on record that a plant of *Stuartia Malachodendron* flowered in his garden at Fulham in 1742, it is still far from a common shrub in gardens. The largest specimen I have seen approached

margins, bright green above, paler beneath. The flowers are creamy-white, often, unfortunately, with one deformed petal, three inches to four inches across, with a central cluster of yellow stamens.

The variety *grandiflora* has, as the name suggests, larger flowers, and is also distinguished by purple stamens.

S. Pseudo-camellia, Maxim., is a tall tree, readily distinguished in cultivation from the other species by its upright habit. *S. Pseudo-camellia* is slow to form a trunk, as it branches freely from the base. The late Professor Sargent, during one of his journeys in Japan, recorded trees fifty feet in height, with trunks six feet in circumference. The ovate leaves are two inches to three-and-a-half inches long and half as broad, bright green above, paler beneath, and finely toothed. The creamy-white, cup-shaped blossoms, two inches to two-and-a-half inches across, with yellow stamens, are borne singly in the axils of the leaves on the young shoots in July and early August.

The early history of this False *Camellia*, as Maximowicz designated it when describing the species in the *Bulletin of the Academy of St. Petersburg*, in 1867, as a cultivated plant would appear to be entirely continental. It was exhibited in flower by Siebold at the International Exhibition at Amsterdam in 1868

under the name of *Stuartia grandiflora*. This name also is used with the coloured plate in the *Revue Horticole*, 1879, and apparently still retained on the continent, as only this week I have seen a plant so labelled, which was purchased from across the water a few years ago.

S. Pseudo-camellia is figured in *The Gardeners' Chronicle*, August 18, 1888, page 187, where it is recorded that the plant flowered on a wall in the nursery of Rodger, McClelland and Co., at Newry, in 1885. The drawing was made from a plant which flowered in the Coombe Wood Nursery of Messrs. James Veitch and Sons, and was exhibited by them at a meeting of the Royal Horticultural Society on July 24, 1888, a First Class Certificate being awarded.

S. serrata, Maxim., is the least known and cultivated of the five species represented in our gardens to-day. It is said to be a common wild tree in Japan, growing to a height of fifty feet to seventy-five feet. It was described and named by Maximowicz in 1867 from specimens collected by him in Japan in 1863.

I can find no record of the date of its introduction to our gardens. The spray from which the figure in the *Botanical Magazine*, tab. 8,771, was prepared, came from the late Sir Edmund Loder's garden at Leonardslee, Horsham, in June, 1917.

Though represented only by healthy bushes at present, its behaviour suggests that in gardens with a mild climate it should, with age, attain the dimensions of at least a small tree. The leaves are elliptic or obovate, with serrate margins, dull dark green above and paler beneath, downy on the mid-rib and in the axils of the veins, one-and-a-half to three inches long, and three-quarters to one-and-a-half inch wide.

The cup-shaped flowers are creamy-white, stained with red on the outside of the petals, two to two-and-a-half inches wide, with serrate margins to the petals, and in the centre a large tuft of showy, yellow anthers. The flowers are solitary, borne in the axils of the leaves of the young shoots in late June and during July.

S. sinensis, Rehd. et Wils., is a free-growing *Stuartia*, native of western China. Mr. E. H. Wilson discovered it in 1901 in Western Hupeh and Eastern Szechuan, when plant collecting for Messrs. James Veitch and Sons. It was at first identified with *S. monadelphica*, a Japanese species, but subsequent investigation proves the Chinese plant to be a distinct species. In *Plantae Wilsoniae*, Vol. 11 p. 396, Messrs. Rehder and Wilson describe the capsule of *S. sinensis* as the largest in the genus, and that of *S. monadelphica* as the smallest.

Mr. Wilson describes *S. sinensis* as a shrub or small tree varying from six feet to thirty feet in height. A bush at Kew obtained from the Coombe Wood Nursery in 1910, is fifteen feet in height.

The leaves are oval or ovate-oblong, finely serrate, bright green on both surfaces, one-and-a-half to four inches long, three-quarters to one-and-three-quarters inch wide. The white flowers, with a central tuft of yellow anthers, are two inches across, and produced in the axils of the young shoots during July.

The figure in the *Botanical Magazine*, tab. 8,778, was made from a spray of flowers sent to Kew in 1917 by H. Williams Grigg, Esq., from a bush flowering in his garden at Cann House, near Plymouth. *A. Osborn*.

HOHERIA LANCEOLATA.

UNDER the above name a plant has recently flowered in the gardens of the Royal Horticultural Society, Wisley, and cut specimens from another source were shown at a recent meeting at Westminster.

The leaves are lanceolate, leathery, glabrous and two to four inches long. The white flowers are very powerfully fragrant. Cheeseman, in his *Manual of the New Zealand Flora*, makes the above a variety of *H. populnea*, a nearly glabrous plant, with much larger leaves. Two other names have been applied to the above plant, one being *H. sexstylosa*, and the other var. *crataegifolia*. The last-named was based on young plants, and the former name is now found to be incorrect as to the number of styles. Indeed, the botanical characters of three genera have broken down, after more extensive obser-

vations and researches and it would appear that *Plagianthus*, *Hoheria* and *Gaya* are to be reduced to one genus, namely, *Hoheria*. The carpels were usually solitary in *Plagianthus*, several in *Hoheria*, and winged on the back, and carpels many in *Gaya* *Lyallii*; but it is now found that the carpels are too variable in number to be definite. The juvenile leaves vary greatly from those of the adult, and the leaves of the latter also vary greatly in shape. *J. F.*

CAMPANULA SPECIOSA, POURR.

THERE are no fewer than five species of *Campanula* of the Canterbury Bell type which are native to south-east Spain. They have been confused by authors, have become confused in cultivation, and may probably have intermediaries linking them in nature. It is not surprising in view of this that, as Mr. Clarence Elliott points out on page 146, what is usually sown in gardens as *C. speciosa* is not the true

FIG. 82.—ROOTED CUTTING OF STUARTIA MALACHODENDRON.

species, or that *The English Rock Garden* contains no recognisable description of *C. speciosa*, Pourr.

Without being in a position to solve all the difficulties which the five species involve, I am tempted to suggest that Farrer's descriptions of *C. speciosa* and *C. affinis* have been obscured by the inclusion of characters that belong to *C. Bolosii*, Vayr., a species which is native to Monserrat in particular and to the Catalanian Pyrenees in general. The most marked characteristics of Vayreda's *Campanula* are its height (from 40 to 120 c.m.), its villous stems and leaves, the very large, projecting style, and the very open bells of an intense blue with deeply-cut, triangular lobes. It appears to be definitely biennial.

A careful reading of Farrer's descriptions of *C. speciosa* and *C. affinis* suggests that one or other of the main characters of *C. Bolosii* have become attached to one or the other species, especially as the other four species native to the same area (*C. speciosa* Pourr., *C. mollis*, L., *C. affinis*, R. Sch., and *C. dichotoma*, L.) are reputed to be of much the same height (10 to 30 c.m.), and therefore on this account alone very distinct from *C. Bolosii*. All these *Campanulas* are stated to be perennial, with

the exception of *C. dichotoma*, which is an annual.

If one were to suppose the five species, four at about their tallest and *C. Bolosii* at about its shortest, to be collected and sent home in a mixed bundle, together with intermediaries (of which there is no record so far as I am aware, but which seem very probable in view of the nature of this group of *Campanulas*), how would the gardener distinguish them? The character of the plants would be presented mainly by their leaves. The leaves of *C. speciosa* are spatulate (the lower) and lanceolate acute (the upper), semi-stem-embracing and toothed; of *C. Bolosii*, lanceolate and stem-embracing; of *C. mollis*, almost spatulate, with the stem leaves obovate, with a very short petiole, the uppermost sessile, the lower toothed, the upper entire; of *C. affinis*, lanceolate; of *C. dichotoma*, ovate and sessile—a series of rather fine distinctions! The mixed bag I am imagining would, therefore, appear much the same in the garden—until one or other was found to be perennial, biennial or annual. I am suggesting, in short, that it is inherently probable than any one of them might be found in gardens under the name of *C. speciosa*. *E. E. T.*

—THIS *Campanula*, which excites the enthusiasm of Mr. Elliott (*Gard. Chron.*, Aug. 20., p. 146), has its centre of dispersion in the High and East Pyrenees. The first one was found by Pourret in the Val Campan, where it is very common on rocky soil in the mountain region. It is common in the Cevennes, the Corbières, and passes to Montpellier in Capouladoux. On the Spanish side, it reaches Barcelona and Saragossa.

The form which Mr. Elliott found in Monserrat has the same appearance as all those I ever found, which answer his description exactly. The plant does not vary but, in the Western Alps, it is replaced by *C. Allionii*, which is its nearest relative. I once found a colony of *C. Allionii* at the foot of the Mont Aiguille (Vercors, near Grenoble) which had the appearance of *C. speciosa*, the branched flower-stems bearing seven to nine big flowers together, so I thought at first sight it was *C. speciosa*. These two *Campanulas* are nearly allied, both being very *envahissantes*, and sometime troublesome plants for the rock garden. Both are of very easy culture.

The three other "speciosas" given by the *Index Kewensis* are synonyms of *persicifolia*, *glomerata* and *elegans*, and have nothing in common with the Pyrenean plant. *Henry Correvon, Floraire, Chêne-Bourg, Geneva.*

GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

L. B. C.'s notes upon the Asiatic *Martagons* (page 111) have interested me in relation to a pretty Lily which came here (whence I forget) in 1922 under the name of *Lilium Duchartrei*, and has flowered every year since about a month later than L. *Martagon*. Its flowers resemble those of L. *Duchartrei* (*Bot. Mag.*, t. 8072) and those of Captain Kingdon Ward's Lily figured in *The Gardeners' Chronicle* of August 13; but they are borne, not in an umbel, but in a stiff raceme, usually of nine blossoms, the stem being three feet high.

L. B. C. observes that Wilson in his *Lilies of Eastern Asia* "has swept all the allied forms (of Asiatic *Martagons*) into one common aggregate under Franchet's L. *Duchartrei*;" but he seems to have overlooked how Wilson states, on page 69 of the said work that, "with the advent of more material from Yunnan, the facts appear in a fuller light, and I am constrained to recognise Franchet's L. *lankongense* as a distinct species."

The Lily we have here corresponds in all respects with L. *lankongense*, as described by Wilson and figured in Plate X of his work—in all respects except, possibly, one. It ought to have a stoloniferous bulb; but, having learnt through bitter experience to be very shy of interfering with a thriving Lily, I have refrained from examining the bulb of this one. Hitherto,

it has shown no sign of wandering stoloniferously, having sent up each year two flowering stems without the slightest shift of position as marked by a cylinder of zinc to protect it from slugs.

Lilies in general have prospered this year, except for damage wrought by mice, voles and slugs. Botrytis has not shown its ugly stain except on one clump of *L. chalcedonicum*; but *L. Sargentiae* got badly nipped by frosts on the last night of April. Lilies used to be grievously afflicted here by Botrytis; so much so that we had practically abandoned trying to grow *L. candidum*. Acting in the belief that the surest means of warding off fungous attack is the promotion of vigorous growth, I have treated all Lily bulbs liberally with wood-ash applied in spring. Whether *post hoc* or *propter hoc*, I leave to wiser heads to decide; but the result has been practical immunity from Botrytis on Lilies.

L. superbum and *L. pardalinum* being reckoned American Swamp Lilies, one is recommended to grow them in a moist border or by the waterside, but such conditions are not necessary in our humid atmosphere; indeed, both species do best in an ordinary border of light, gravelly loam with an admixture of pulverised peat. I have this morning measured a clump of *L. superbum* in such a situation. It has three principal stems measuring respectively ten feet one inch with twenty-eight blooms, nine feet four inches with twenty six blooms, and seven feet five inches with thirteen blooms. Beside it a clump of *L. Martagon dalmaticum* has risen to a height of seven feet, and was a notable object in July with its candelabra of swarthy, highly-varnished turneaps.

No genus is more faithful to the structure and colours of its flower than *Hypericum*, and in late summer it is difficult to pronounce which is the best of the shrubby species. On the whole, perhaps, if one were limited to a single species, that should be *H. Forrestii*, but *H. patulum* var. *Henryi* runs it very hard; the typical *H. patulum* is not hardy in all districts, but where it thrives has the merit of continuing covered with a succession of flowers until stopped by frost. All the shrubby species seed very freely, and a very fine chance hybrid has sprung up here to a height of eight feet, the reputed parents being *H. Hookerianum* and *H. patulum*. *Herbert Maxwell, Monreith.*

ALPINE GARDEN.

SCABIOSA PTEROCEPHALA.

THIS pretty plant (Fig. 83) is a native of the Grecian mountains, where it occurs in dry, rocky places up to six thousand feet. The leaves are covered with a soft, grey pubescence, and the flowers are of a pleasing shade of mauve. When the flowers are over the plant is no less attractive on account of the feathery tufts which characterise the fruits and which recall those of certain species of *Clematis*. *J. E. G. W.*

GERANIUM FARRERI.

THIS Geranium is undoubtedly one of the best of the genus and well worthy of cultivation. Although uncommon it is not difficult to establish in a light, sandy soil. In its habit of growth it is not unlike *G. cinereum*, being of a neat, tufted habit and not exceeding four inches in height.

The flowers, which are produced very freely, are of a very delicate pink, thinly veined with green at the base of each petal, and the anthers are black. Each flower stalk carries two separate flowers, which add to the wealth of bloom. Propagation is effected by division or seeds.

CAMPANULA HALLII.

ONE of the prettiest of the now numerous new hybrid Campanulas in existence is that named *C. Hallii*, in honour of the raiser, Mr. Alva J. Hall, of Harrogate. It has been in bloom in my rock garden for some time, and is

universally admired for its neatness of habit and the beauty of its pure white flowers. It is evidently a *pusilla* or *caespitosa* hybrid as it has a similarly compact habit, with small, bright green leaves. Above these are produced a great number of the lovely open white bells. It is seldom that we have a new hybrid of such an excellent constitution as this has; indeed, some of the newer hybrids are decidedly "miffy,"

MALVASTRUM CAMPANULATUM.

ALTHOUGH not of recent introduction, this *Malvastrum* is not general in cultivation. It has a loose, free habit, and although by no means a trailer, it is not stiff or erect, seldom exceeds one foot in height, and makes an excellent subject for the rockery.

The flowers are pale violet with black centres;

FIG. 83.—SCABIOSA PTEROCEPHALA FLOWERING IN THE R.H.S. GARDENS, WISLEY.

but this fault cannot be attributed to *C. Hallii*. It is growing here on a slightly sloping bank in the rock garden and has made great progress since it was planted, and it does not in the least belie its reputation as a splendid grower. It appears to be comparatively indifferent regarding soil, but that usually afforded to the bulk of alpine plants will suit it perfectly. It is certainly a little gem worthy of being grown in the most select rock gardens. *S. Arnott.*

they are cup-shaped and about one inch in diameter. Each stem bears up to twenty axillary flowers.

This plant is not at all fastidious in the matter of aspect or soil. Seeds do not appear to set, but propagation may be easily effected by division.

The plant is sometimes known as *Malva campanulata*; it is a native of Chile and is illustrated in *Gard. Chron.*, September 3, 1910, Fig. 71. *S. R. D.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

LILIUM MONADELPHUM.

LILIUM MONADELPHUM was founded by M. von Bieberstein 119 years ago,* and he based the species on the peculiar character of the stamens which, in the type plant were monadelphous, i.e., united in a solid band where they encircle the ovary and not springing separately from the base of it as is usually the case in other species. Monadelphum is the Latinised version of the Greek *μόνος* (one) and *ἀδελφός* (brother), and Monadelphia is a Linnean class in which the anthers are united by their filaments into a single brotherhood. To make the point clear to those who have not hitherto grasped the meaning of the interesting botanical feature in question, Miss L. Snelling has prepared a drawing (Fig. 84) in which the stamens are free and another (Fig. 85) in which they are joined up in monadelphous fashion. The lower drawing has been reconstructed, because a living specimen exhibiting the peculiarity is not available.

The character is not a constant one, and out of scores of specimens of *L. monadelphum* the writer examined when the species was more readily obtainable than it is now, he only found a few in which the stamens were united at their base, and not one in which they were united even half way up the ovary. In his *Monograph*, Elwes wrote that though the monadelphous character did not appear to him to be a constant or reliable one, it varied very much in different plants—some having the filaments united for at least a third of their length and others only at the base, or, as is more common in the variety *Szovitsianum*, not at all.

On the other hand the Russian botanist Miscenko, in a critical study of the characters of *L. monadelphum* and its varieties,† stated that in the majority of cases the stamens of *L. monadelphum* are united somewhat lower than the middle in a tube, but that probably in the limits of variation of this species there lies a possibility of the formation of free stamens.

Miscenko's observations were the result of an examination of living plants in the garden of M.M. Regel and Kesselring at Petrograd and as all three Lilies—*monadelphum*, *Szovitsianum* and *Kesselringianum*—were flowering simul-

taneously, and in adjacent beds, he found it easy to observe the differences between the three.

In the same paper, however, Miscenko quoted a letter to himself from U. N. Voronoff, in which

FIG. 84.—LILY STAMENS FREE.

the latter wrote that he personally had observed *L. monadelphum* and *L. Szovitsianum* growing wild in Tsebelid (Transcaucasia) and often experienced a difficulty in assigning different specimens to one or the other! In any case, though botanically important, the monadelphous character is only of secondary interest to gardeners and as already explained it seems to be rarely found in plants cultivated in this country, possibly because *L. monadelphum* itself is now rare here; it seems to have been displaced by the variety *Szovitsianum*.

FIG. 85.—LILY STAMENS JOINED (MONADELPHOUS).

Besides *Szovitsianum* there are several well-marked forms of *L. monadelphum* which have been named:—*colchicum*, *Ledebouri*, *ponticum* and *Kesselringianum*; and though he had obviously not gone very deeply into the synonymy of such of these as he knew, the observations of Dr. Wallace* on them are as apposite as when they were made forty-six years ago: so they are quoted in full.

"This Lily, more generally called *Szovitsianum*, and sometimes *Colchicum*, is a most beautiful and rather variable species: not

merely from the unusual (canary) colour of the flowers, their large size, and contrast with the chocolate-brown anthers, but from the symmetry of the pyramidal spike. Each flower (when well-cultivated) like an evenly suspended bell, hangs with base parallel to the horizon. . . . We have had in one season over 1,500 spikes in bloom, from 4 to 6 feet high, with from 4 to 20 bells on each spike, some of them (the flowers) 6 inches across, most beautifully coloured, scarcely any two alike, a sight of beauty that falls to the lot of but few.

Among its many varieties, we have selected the following as especially worthy of notice:—

A. A fine broad petalled form with large bells of flowers, rather pale in tint, but regularly and heavily spotted with about four rows of dark purple spots on either edge of the petal.

B. A very rich deep canary, almost citron-coloured form, with very few spots.

C. A pale lemon-tinted form, few spots.

D. Has a deep yellow centre and paler tinted edges.

E. A peculiar pale coloured form, very regularly and richly spotted, with pale coloured anthers of a light greenish tint.

F. The unspotted variety, of a deep citron colour. We have been accustomed to call this variety *Monadelphum*. According to some Liliophilists, this form (*Monadelphum*) differs from the type* in (a) having anthers covered with lemon-yellow pollen, instead of chocolate brown, (b) in being earlier by three weeks to flower, and (c) in showing its flower buds directly it is above the ground, whereas, in the type, the buds are concealed by the leaves till ready to bloom. As regards (a), we have noticed anthers bearing pollen of all shades, from a pale greenish-yellow to a very rich red brown. As regards (b and c), we have noticed there are differences, more especially in plants that have been planted in the previous autumn, and are not yet well established, but not with plants like our own, that have been undisturbed through three winters. Cultivators must not expect to see this Lily in all its beauty unless planted in a moist-loamy or clayey soil, and left undisturbed for at least two winters—then it will be magnificent."

L. monadelphum seems to have been unknown in gardens here till 1842, when it bloomed in the Royal Horticultural Society's garden at Chiswick from bulbs sent to the Society by de Hartwiss, of the Imperial gardens at Nikita in the Crimea, as *L. monadelphum*. Later, Dr. Fischer, of St. Petersburg, sent bulbs here under the same name. In describing the R.H.S. Lily,† Lindley and Paxton adopted a name—*L. Loddigesianum*—given by Roemer and Schultes‡ to a form of the plant which had been figured in the *Botanical Magazine*|| as *L. monadelphum*, on the ground that the *Botanical Magazine* Lily was specifically distinct from Bieberstein's original type plant of the same name. They pointed out (1) that in Fischer's plant the stamens were not monadelphous; (a) that von Bieberstein described the stamens as sometimes monadelphous, and they pertinently asked what differences beyond size of flower and petal markings could be found between the so-called *L. Loddigesianum* and *L. pyrenaicum*.

The involved nomenclature of this fine Lily has been dealt with by Van Houtte,¶ who reached the conclusion that though *L. monadelphum* and *L. Szovitsianum* are singularly alike in their port and their characters, there are specific differences. Van Houtte referred to the monadelphous stamens of *L. monadelphum*, the yellow pollen and the straight style, contrasting them with the free stamens and the orange-coloured pollen of *L. Szovitsianum*.

Miscenko, who had published a diagnosis of *L. Szovitsianum* three years before,§ dealt

* There is evidently some confusion here in Dr. Wallace's mind, because *L. monadelphum* is the type, and a reference to von Bieberstein's fine plate of it in *Centuria Plantarum Rariorum Rossiae Meridionalis* (tab. 4) shows the petals prominently marked with linear dots.

* *Notes on Lilies*, 2nd ed., p. 173 (1879).

exhaustively with the synonymy of the two Lilies in 1914, in the paper already referred to, and reached the conclusion that they differed in form and structure.

There are fine and poor forms of *L. monadelphum* and *L. Szovitsianum*, but the most desirable form of the latter is probably that with large flowers of which the petals are pale canary in colour, broad and marked on each side of the deep midrib with three or four rows of purple linear dots. The petals reflex to form a flat—not globular—flower and where the tube of the latter joins the pedicel it is flushed with purple. The tips of the petals are purple, too. This variety is usually fragrant, but in some of the other forms the scent is unpleasant and hardly distinguishable from that of *L. pyrenaicum*.

In another good form the flowers are smaller and more tubular than usual and are of deep golden colour, like that of *Coreopsis grandiflora*. Prior to the great war, this form was marketed from time to time by nurserymen as *L. colchicum*, a name for which there does not seem to be any formal publication—only an informal mention by one Steven, of a specimen in the Herbarium of the Botanic Garden in Berlin. *L. colchicum* derives its name from the fact that *L. monadelphum* and its varieties are native of the ancient Kingdom of Colchis, which, in the fourteenth century was part of Georgia—a province south of the Caucasus, between the Black Sea and the Caspian.

The variety *Szovitsianum* was first described by Fischer and Lallemand in 1839 in their index of plants in the Imperial Garden at St. Petersburg,* and those authors recognised the near relationship between the plant and *L. monadelphum*. They named the Lily for Alex. Szovits from whom they received the specimens on which the variety was based. According to Miscenko the only known habitat of this Lily is the sub-alpine zone of Guria and Adguria in Western Transcaucasia—the country of *L. monadelphum*. In the *Monograph* of Elwes the range is given as through Imeretia, Mingrelia and Georgia, but the multiplicity of geographical names need cause no confusion.

If *L. Szovitsianum* is rightly regarded as a variety of *L. monadelphum*, it is difficult to avoid the conclusion that *L. colchicum* and *L. Kesselringianum* must be regarded in the same light, though Miscenko makes the latter a good species.† Miscenko quotes D. Sosnovsky, then (circa 1913) botanist of the Tiflis Botanic Garden, as telling him that *L. Kesselringianum* grew on the limestone mountains of Djvari in Mingrelia, among *Betula Medwedewi* at an elevation of 6,000 feet, and that though the shape of the flower struck him very much, he paid no particular attention to it, considering it as an ordinary *L. monadelphum* or *L. Szovitsianum*, i.e., a variety of the former.

L. Kesselringianum may be described as a pale straw-coloured, starry-flowered edition of *L. Szovitsianum*, with chestnut-purple pollen and stigma of the same colour. The anthers are half the size of those of *L. Szovitsianum* and the petals have scattered purple linear markings near their edges. The author had the plant in cultivation in 1915 from bulbs kindly sent to him by M. Kesselring and noticed that when *L. Szovitsianum* and *L. Kesselringianum* were grown together their differences were as obvious as those between *L. monadelphum* and *L. Szovitsianum*. These differences are clearly shown on the plate (Fig. 85) reproduced from Miscenko's paper, already referred to. They were not more obvious, however, than the differences between the many varieties of *L. pardalinum*, for instance, all of which are regarded as belonging to the one species; and it would probably be wise to regard *L. Szovitsianum*, *L. Kesselringianum* and *L. colchicum* as distinct varieties of the older *L. monadelphum*. On this point, however, Mons. W. Kesselring, in a letter

to the writer,* expressed the view that the three Lilies mentioned are not varieties of one species, but represent good species, quite different in themselves, natives of different regions where one finds only one of the three species, and never all three together. It will be observed, however, that this view does not coincide with that of Voronoff, already cited.

The relationship between *L. monadelphum*

described as through the Caucasus, but it may well prove to have a wider distribution.

Students of *L. monadelphum* and its varieties who are familiar at once with the literature of the subject and with the Lilies as grown in Britain, will occasionally find themselves in a quandary because of the seemingly contradictory and involved nature of the synonymy. But they can always return to von Bieberstein's descrip-

FIG. 86.—LILIUM MONADELPHUM.

(1) *L. Kesselringianum*, Misc. ; (2) *L. Szovitsianum*, Fisch and Lall. ; (3) *L. monadelphum*, M.B. Reproduced from Miscenko's paper.

and *L. pyrenaicum* has yet to be determined, but apart from the monadelphous character of the filaments, the two may be more closely akin than is generally supposed. The author has had plants of *L. monadelphum* (but always lacking the monadelphous stamen character) from the continent which might be equally fairly described as fine examples of *L. pyrenaicum* or poor examples of *L. monadelphum*, and the known presence of the Pyrenean Lily so far east as Bosnia and Albania is suggestive. The range of *L. monadelphum* is generally

* Dec. 1, 1915.

tion and drawing of *L. monadelphum* (Fig. 86), and with these in view will have little difficulty in distinguishing it from its varieties. The latter, as grown in Britain and called *Szovitsianum*, are a trap for the unwary, as they have largely if not entirely, been raised from seed by a single grower whose stocks must have been crossed and re-crossed often enough to account for the remarkable variations.

Like all good things, the finer varieties of *L. monadelphum* are worth waiting for, but they need patience, inasmuch as large bulbs do not transplant well, and those of duck's egg size, which

* *Index seminum quae hortus botanicus imperialis Petropolitani*, 1839, p. 58.

† "Characteristic signs in the structure and colouration of the blooms of *L. monadelphum* and *L. Szovitsianum* and a new species from the Caucasus, *L. Kesselringianum*, Misc." Petrograd, 1914.

generally move well and throw a flower or two the season after planting, do not reach maturity for several years. Whatever the size of the bulbs, planters should bear in mind that these Lilies have a comparatively short resting season and begin to make new root-growth early, so that they should be transplanted soon after the seeds have ripened. In the south the bulbs should be in the ground before the end of September.

The bulbs—which in old specimens may be as much as 6 inches in diameter—should be planted 4 or 5 inches deep. The Lily seems to grow as well in broken shade as in full sun, and the finest

the flowering stage for five years, and sometimes more. The seeds germinate quickly, but do not show their cotyledons above ground during the first season of germination, so that those unaware of this peculiarity are surprised, on examining the contents of the seed pan at the end of the first year to find seedling bulbs where there has been no obvious sign of life. Seeds may be sown in the open, and the author has often noticed self-sown seedlings springing up from the ground round about the base of this Lily in the garden, where the soil is undisturbed.

Those who are interested in the history and

There are also good plates of the variety Szovitsianum in *The Garden*,* and another in *Flore des Serres*;† the two plates in the *Monograph* of Elwes‡ illustrate the remarkable variations in the species already referred to, and these are even more clearly seen if the plate in *Flore des Serres* is compared with that of Regel in *Gartenflora*,§ which Baker, in his consideration of *L. ponticum*, regards as representing *L. Szovitsianum*. There is an illustration of a good flowering head in the *Gardeners' Chronicle* of July 16, 1910, p. 37, fig. 15. A. Grove.

SALE OF UNASCERTAINED GOODS AND SALES BY SAMPLE.

By a contract for the sale of unascertained goods is understood a contract for the transfer of certain things which have to be weighed or counted or otherwise dealt with before the price to be paid for the whole can be named, or the quantity to be transferred can be arrived at. For example, a man may sell a clamp of Potatoes at so much a ton, but before the price for the whole clamp can be arrived at the Potatoes will obviously have to be weighed. Then again, he may sell one ton of Potatoes from a certain clamp, yet something has to be done before the buyer can say "those are the Potatoes I have bought." In all these cases the same question arises, and that is, if after the making of the contract, but before the goods have been delivered, those goods are destroyed or stolen, who will have to bear the loss, the buyer or the seller?

The Sale of Goods Act of 1893 again provides us with the answer. According to the Act, where there has been a sale but the seller has to "weigh, measure, test or do some other act or thing—for the purpose of ascertaining the price," the buyer will not be liable if they are destroyed before this has been done and before he has had notice of that fact. Thus, referring to the clamp of Potatoes again, if after the contract had been made and the Potatoes had been weighed and the result of the weighing was known to the buyer, some of the Potatoes were stolen, the buyer would have to pay for the whole quantity, although he only received part of them.

In the second case, where the price that will have to be paid is known, but the actual goods that will be delivered are not, the buyer will be liable for these so soon as they have been "unconditionally appropriated to the contract." Thus, in the second example, if the seller has weighed a ton of Potatoes and set them apart from the rest, and had, in fact, unconditionally appropriated them to the contract, should any of them be stolen or destroyed, he could compel the buyer to pay for the ton and not merely those which were left.

SALES BY SAMPLE.

In the case of sales by sample, the Sale of Goods Act states that the following rules shall be observed:—

(a) There is an implied condition that the bulk shall correspond with the sample in quality.

(b) There is an implied condition that the buyer shall have a reasonable opportunity of comparing the bulk with the sample.

(c) There is an implied condition that the goods shall be free from any defect, rendering them unmerchantable, which would not be apparent on a reasonable examination of the sample.

In addition to those rules it is important to note that where goods are sold by description as well as by sample, they must correspond with the description as well as comply with the above rules. Harold Sharman.

FIG. 87.—LILIIUM MONADELPHUM, BIEBERSTEIN.

specimens the author has seen were growing close to a Yew hedge in partial shade in the garden at Ketton Cottage in Rutland. The stems were about 6 feet high and nearly as large in diameter as a penny.

In the south the earliest flowering variety of *L. monadelphum* is usually in bloom in the first half of June and the other varieties follow it through that month. The Lily is not stem-rooting. As Dr. Wallace observed, one variety has a curious way of keeping its flower buds tucked away among the topmost leaves, until they are about to open, a peculiarity it shares with *L. testaceum*. The foliage of *L. Szovitsianum* will sometimes turn a deep brown while the plant is in growth, and this is usually a sign that there is something amiss with the bulb.

Raising this Lily from seed is a slow proceeding, as the seedlings do not usually reach

synonymy of *L. monadelphum* and its varieties will find a fine plate of the type in von Bieberstein's work already quoted.*

This plate, which is reproduced in black and white in Fig. 87, shows a deep yellow, small-flowered Lily without a trace of purple colouring anywhere on the petals. There is another plate of *L. monadelphum* in Reichenbach's *Flora Exotica*,† and this, again, shows a small-flowered Lily without trace of purple, and with green style and stigma differing from those in Bieberstein's plate. In the plate of *L. monadelphum* in *Gartenflora*‡ the style and stigma is wanting in all four of the flowers and in the sketch of the anthers!

NOTICE OF BOOKS.

Landscape Gardening in Germany.

THE sixth book in the *Gartenschönheit* series is the first in a sub-series of three books grouped under the general title of *Garten und Haus*; *Das Haus in der Landschaft** ("Garden and House; the House in the Landscape"). It is a good and expressive title for the work in question.

The author, Herr Wiepking-Jürgensmann, is a well-known and clever German garden architect, and the book consists in the main of pictures, plans, and interesting descriptions of gardens laid out or altered by him, many of them intended as settings to dwellings of high archaeological or artistic interest, and placed in the most

attained by age and long, slow development. If one may mention a disadvantage in the book from the foreign reader's point of view, it is the slightness of the indications as to the geographical position of the various estates. It may be that their names are so well-known in Germany that no particularising is needed; but it is intriguing to see illustrations such as those of "Der Garten Murats," or "Normannenburg an der Adria" (the last-named a glorious ruin on a tall crag, sea-girt on three sides) and to have no nearer description of where these lovely places can be seen. Possibly, however, the architect is thus ambiguous out of consideration for the convenience of his patrons. The working plans which accompany the text are not the least interesting part of the work; in some cases it must have required real genius to make so good a use of a terrain so awkwardly placed and shaped.

PUBLIC PARKS AND GARDENS.

THE ROOKERY, STREATHAM COMMON.

THIS charmingly secluded garden, situated on the south side of Streatham Common, and controlled by the London County Council, is one of pleasant surprises to the visitor entering it for the first time.

The ground slopes away sharply from the entrance, wide stone steps leading down through spacious lawns that form an admirable setting to the fine specimens of *Cedrus Libanii*. At the foot of the steps a Rose pergola crosses at right angles, and on reaching this, the sudden view of the garden below, laid out in the Old-English style, is most strikingly pleasing and impressive. This garden is oblong in shape, wide borders running along the boundaries, while the central

FIG. 88.—MESSRS. E. WEBB AND SONS' LARGE GOLD MEDAL EXHIBIT AT SHREWSBURY SHOW.
(see p. 159).

picturesque and romantic situations. The author is an artist in the best sense of the word; all his heart is in his work, and he knows how to convey his own enthusiasm to the reader. One feels with what eagerness he must visit for the first time the house or castle of which the gardens are to be formed or reformed; his keen researches into its past history; his detailed and anxious study of the surroundings lest a false note creep in to mar the perfect beauty of the final whole. As he himself remarks, many of the newer gardens created by him are not yet at their best, having been planted only a few years ago; yet most of the photographs and sketches present a picture of very harmonious and restful beauty, such as is usually only

One of the most charming of the illustrations shows a small nude child playing on the edge of a Lily pond, which the caption explains is used regularly as a children's open-air bath. The author, in commenting on this, speaks bitterly of the garden-less condition of the flat-dwelling town child. Gardening in Germany, never so popular as in England, suffered a severe set-back during the war; but as Herr Wiepking states, in the last ten years there has been an eager movement among the rising generation towards garden-making, and all the delights that the possession of a garden brings in its wake. Certainly the widest possible circulation of books like *Garten Und Haus* can do nothing but good, and should do much to encourage a love of gardens among the young men and women of present-day Germany, thus directly contributing to a permanent improvement in the general standard of physical health.

portion is divided into a series of large beds, the intervening paths being crazy-paved. A small, circular pond contains *Nymphaeas*, and around this are several rough-edged York stone pillars, suitably clothed with plants, together with an old-time, roofed well; all these provide distinct features, and to the visitor a sense of peace and quiet. The beds and borders are full of colour provided by a large variety of herbaceous plants. Among useful shrubs noted in the garden the following are worthy of mention: *Punica Granatum*, *Ceanothus*, *Syringa Wilsonii*, *Clerodendron trichotomum*, *Spiraea bracteata*, *Daphne Mezereum* and *Deutzia crenata*.

Beyond the old-English garden, a long, narrow strip of land has been fenced off from the orchard and planted as a "White" garden, with such subjects as *Lilium candidum*, *Digitalis*, *Achillea The Pearl*, *Phloxes*, *Veronica salici-*

* *Garten und Haus*. 1. *Das Haus in der Landschaft*. Von Heinrich Fr. Wiepking-Jürgensmann. Berlin-Westend, Verlag der Gartenschönheit. Paper, 6 Mks.; bound, 8 Mks.

folia, Antirrhinums, Campanula alliariaefolia, C. persicifolia, silver-variegated grasses, Cornus alba sibirica variegata, Buxus sempervirens var. argentea, and Polygonum baldschuanicum clothing an old Apple tree, with white Violas forming an edging. It was interesting to note here a particularly healthy and thriving plant of that fine New Zealand shrub, Plagianthus Lyallii, some eight feet in height, and flowering profusely.

Then, turning to the right near the entrance, a path leads to the rock garden, through which a tiny stream wends its quiet way between the stones, the sides affording accommodation for such moisture-loving plants as Gunnera manicata, Phormium tenax, Mimulus luteus, Arundinaria nitida, Saxifraga ligulata, Primulas, etc., while the miniature pools are filled with small-growing Nymphaeas and Sagittaria sagittifolia.

The rock garden is amply furnished with types of alpine plants, and shrubs noted here include Pernettya mucronata, Genista hispanica, Veronica cupressoides, Berberis Darwinii, Convolvulus Cneorum, Pittosporum Mayi, a good example of the curious Olearia nummularifolia, Spartium junceum, Phlomis fruticosa, Cistus laurifolius, and occasional trees of flowering Prunuses, while many superb specimens of Olearia macrodonta occur in and about the shrubberies on the outskirts. H. G. King.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

See Tables and Summaries, Ante. pp. 131-137).

(Continued from p. 175.)

ENGLAND, E.

HUNTINGDONSHIRE.—The general excellent prospects for a good fruit year were rather spoilt by 10° of frost on April 29. In these gardens we are very fortunate in having quite an average crop of stone fruits, but in some localities Plums are a total failure. Apple trees in exposed places are fruitless, others are cropping abundantly. Strawberries were badly crippled by frost. The June rains came just in time to save the Raspberries, for these gardens are situated on the edge of the Fens, and the land dries out very quickly. Guy S. Aubertin, Conington Castle Gardens, Peterborough.

LINCOLNSHIRE.—In the early spring all kinds of fruits showed remarkable promise of record crops; for the trees were a mass of flower. On the night of April 30 we had 10° of frost, and the next two days cold, cutting north-easterly winds prevailed; the result was the Pear crop was more or less ruined. Plums were drastically thinned, but sufficient were left for a good average crop, while Apples were unharmed. The early flowers of Strawberries were blackened, and the ripening of the crop retarded a fortnight. Black Currants were thinned somewhat by the frost but other small fruit were unharmed. Alexander M. Warnes, Highfield House Gardens, Gainsborough.

—Fruit trees, generally, were a mass of bloom, but late frosts spoilt the crops. Strawberries rotted during the continuous rains, but the late varieties, Waterloo and Givon's Late Prolific, gave heavy crops, which ripened very late. Red Currants and Black Currants are very plentiful. Thomas Cox, Hainton Hall Gardens, Lincoln.

—The fruit crops, on the whole, are satisfactory. Apples are very good and Pears a medium crop. Most bush fruits are yielding well, particularly Gooseberries and Black Currants. The Strawberry crop was very good despite the very severe frosts experienced at the end of April, when all the early flowers were destroyed. Three varieties which do well here are Royal Sovereign, King George and The Duke. There does not appear to be very many Plums in this district, no doubt owing to the late frosts. A. E. Jackson, Normanby Park Gardens, Scunthorpe.

NORFOLK.—The year, 1927, will, I think, so far as Norfolk South district is con-

cerned, go down as one of the worst on record for hardy fruits, for after about six weeks of cold, east winds and frosts, most of the fruit blossom failed to set. At this date, Plums, Apples and Pears are dropping freely and are late in maturing. Strawberries and Black Currants have suffered most amongst the small fruits from the adverse weather of spring. All fruit trees are clean and free from aphides. The soil is very light in texture and overlying sand and gravel. G. Barrell Merton Hall Gardens, Watton.

—The Apple crops promise to be about average, in spite of the unfavourable weather at flowering time. Many Apples dropped during their second swelling, and this applies to all varieties. Those carrying good crops are Warner's King, Doctor Harvey, Keswick Codlin, Wellington, Vicar of Beighton, Allington Pippin, Norwich Pippin, Worcester Pearmain, Blenheim Pippin and James Grieve. Those carrying light crops are Lord Derby, Lane's Prince Albert, Newton Wonder, Peasgood's Nonesuch, Annie Elizabeth, Cox's Orange Pippin, King of the Pippins and Court Pendu Plat. Pear trees set good crops on walls, but all these fruits have fallen in the open. Plums are plentiful on wall trees. Raspberries are an excellent crop, but the yield of other small fruits is poor. We registered 8° of frost on the last morning in April, also on the first morning in May. May and June were cold, wet and sunless, the winds generally being east to north-east. Isaiah Johnson, Catton House Gardens, Norwich.

SUFFOLK.—It is somewhat surprising that after frosts of such severity as were experienced in this locality during the last week in April, there is any fruit to record at all. Examination of Apple blossoms showed stamens and pistils black, even in unopened flower buds, yet many trees, especially in sheltered situations, have a fair crop of Apples. Pears are a complete failure, and Plums, although the blossoming period was over when the frosts occurred, failed to set. Currants and Gooseberries lost quantities of berries but those left have finished well owing to the wet weather in June. Strawberries have been disappointing; frost destroyed the leading berries on the trusses, and wet weather rotted the berries in the beds. E. G. Creek, County Horticultural Instructor, Abbey Ruins House, Bury St. Edmunds.

(To be continued.)

THE VINERY.

MIDSEASON Grapes are ripe or approaching ripeness, and damping the floors, etc., should be almost discontinued unless hot, dry weather necessitates the promotion of atmospheric moisture, when damping once a day will suffice.

The weather up to the time of writing has not been favourable for the ripening of Grapes, and it has been necessary to use a little fire-heat to maintain a free circulation of air and to prevent moisture from condensing on the berries. Shank'd berries will be prevalent this season if the borders are in an exhausted condition, and preparation should be made to renovate them. Obtain a supply of good fibrous loam, mortar rubble, wood-ash and charcoal in readiness, adding one barrowful of the three last-mentioned materials to every cart-load of loam, which should be chopped up roughly, and bone-meal and half-inch bones at the rate of one peck to each cart-load of the compost. So soon as the Grapes are harvested, fork out the old surface soil down to the roots and substitute the fresh compost. Young, fibrous roots will develop freely in the new soil before the leaves fall, and the rods will attain fresh vigour.

If it is necessary to lift the vines and renew the border entirely it would be wise to defer this until September, when all the old soil should be carefully taken away. During the time the roots are exposed they should be sprayed on frequent occasions. First put the drainage in order and then spread a layer of turf grass downwards over it. Add the new soil about the roots after the latter have been placed in position. Make the soil of the border very firm, and when the work of planting is completed syringe the vines on sunny days and shade them if necessary. E. Neal.

HOME CORRESPONDENCE.

New Irises.—Our attention has been drawn to the fact that, in publishing the list of varieties of Irises which gained awards in the recent R.H.S. Iris Trials at Wisley, the two varieties "Mystic" and "Tenebrae" are included without any indication that these two varieties were raised by Mr. A. J. Bliss. We feel sure that this omission is due to your receipt of the list of awards from the Royal Horticultural Society without this information being stated, but we think it is only fair that Mr. Bliss should have the credit due to him for raising these two fine varieties, and we hope you will find it possible to state in your journal that these two Irises were raised by him. We have already written to the Royal Horticultural Society pointing out the omission in their report. *The Orpington Nurseries Co., Ltd.*

Spring Bedding.—As bulb catalogues are arriving almost daily, a suggestion for colour schemes may prove useful. The main colour effect in beds of Tulips should be provided by the dark coloured varieties, and these should be interplanted with rows or groups of a contrasting colour, while the carpeting of the bed may be either Myosotis or Polyanthus. Artus, a dark scarlet, early, single Tulip, would look well interplanted with White Swan or King of the Yellows. The Darwin Tulips lend themselves to this method. Plant the black varieties La Noire and Zulu, using, for contrast, Loveliness, carmine rose; White Queen, or Inglescombe Yellow. L. Le C. T.

Mitraria coccinea.—Although this charming shrub does not appear to be included in Mr. W. J. Bean's great work, *Trees and Shrubs Hardy in the British Isles*, I have grown it for a good many years and never known it to suffer more than slight injury from frost—and 15° to 20° are not infrequent here. A light, very gritty soil may explain this to some extent, but the fact that M. coccinea undoubtedly enjoys the overhanging shelter of some neighbouring evergreen is, of course, very helpful in carrying it through the winter. That this Chilean shrub, which was introduced in 1848, should delight in considerable shade, even a north aspect, need not surprise one, since that partiality is a well-known characteristic of many shrubs and plants of Chili. But I have often been impressed by the manner in which M. coccinea will seek any shade that is within reach by thrusting out yard-long, semi-prostrate branches into this sunless region, while the rest of the shrub will remain close and stunted. Nor is this trait inimical to a free production of the beautiful vivid scarlet flowers, which are often borne in abundance on plants which never get any sun, save, perhaps, in late evening in full summer. The late Mr. E. Charles Buxton grew and flowered this shrub well in the company of Philesia buxifolia on the north side of a large Yew, and another friend had it placed among rather dwarf Rhododendrons through which it thrust long branches which blossomed with delightful freedom. In a shrub which is not considered hardy this affection for shade and shelter is obviously a most commendable virtue. A. T. Johnson.

Ex-Service Gardeners.—May I appeal, through *The Gardeners' Chronicle*, to employers to give a fairer chance to ex-service gardeners. We willingly gave our services to the country and were ready to sacrifice our lives; therefore it is not too much to ask that those of us who are capable, all-round men, honest and keen on our work, should be given that chance we long for. I believe I have the skill and knowledge for a reasonable post, but at thirty-seven years of age I find myself rejected in regard to applications. I am partially deaf and have that facial pallor that is caused by extremes of climates, i.e., service in Mesopotamia and Siberia—one in blazing sun the other 50° of frost—therefore, would-be employers often say I am unsuitable, or do not look strong. I have seen ex-policemen with good pensions given jobs that ex-service gardeners should have. I have a small pension, but insufficient to enable me to rent a piece of land and cottage that would offer the chance of a living. J. M.

SOCIETIES.

SOUTHPORT FLOWER SHOW.

THE Southport Flower Show is an established horticultural function, notwithstanding that it is only four years old. We cannot remember any other exhibition, commenced on such extensive lines as this, and certainly none other big show that was an unqualified success right from the start. Foresight, enterprise, generous dealings with all concerned, and kindly forethought for exhibitors, judges and pressmen have combined to make Southport an annual Mecca for thousands of horticulturists drawn from many parts of the British Isles. Exhibitors have found Southport Show a good opportunity for business, and this, together with the considerate treatment they receive, induces them to attend year after year.

The show held on August 24, 25 and 26, in Victoria Park, was magnificent; it was larger and finer than its predecessors, and there was a general all-round improvement in the quality of the displays. Competition was good in the

Show Committee from the first, is a capital organiser, and an untiring, cheerful worker; Alderman Wood, the Vice-Chairman, whose winning personality is a great asset to the function; Alderman Aveling, who was Mayor during the first year of the show and is as enthusiastic and hard-working as ever; Mr. Crankshaw, a man of tremendous energy and wonderful geniality; Mr. W. Clark, Parks Superintendent and Show Superintendent, a big and large-hearted man and a great smoother-out of difficulties; Mr. Wolstenholme, the Secretary, who never obtrudes himself, but whose efficiency is beyond question; and, lastly, the Mayor, Mr. G. H. Hibbott, J.P., who has kindly words for every exhibitor, and we believe for every assistant, thus maintaining that fine spirit of camaraderie that is so outstandingly characteristic of Southport Flower Show.

The attendance at Southport, as recorded by the turnstiles, was 84,087, as compared with 67,514 in 1926. Before the show opened £500 worth more of tickets were sold than in 1927, and the whole takings were far in excess of previous years. Success leads to success, and we understand that a permanent steel and

Chesterfield, whose examples of *Codiaeum* Prince of Wales were particularly bright and elegant. Mr. HOLMES made good use of *Ixoras*, *Clerodendron fallax*, *Lilium auratum*, *L. speciosum* and *L. Henryi*, *Nandina domestica* and *Cattleya Loddegesii*—a very handsome exhibit. Third prize was obtained by Sir GEORGE KENRICK (gr. Mr. J. Macdonald), Whetstone, Edgbaston, with a very pretty group in which *Vanda coerulea*, *Dendrobium superbiens*, *Cattleyas*, *Oncidiums*, *Kalanchoe* and *Gesneras* were leading features; some fine *Codiaeums* were also included. Fourth, Mr. W. R. MANNING, Dudley; fifth, CHEADLE ROYAL MENTAL HOSPITAL (gr. Mr. A. Falconer), Cheadle; sixth, Mr. T. M. PETCH, Bradford.

MESSRS. J. CYPHER AND SONS were also awarded the Brunner Cup, offered for the best competitive exhibit in the show, and the award was made to their first prize exhibit in this great class.

A space of 250 square feet was allowed for a group of foliage plants, where the premier award was the new Challenge Trophy presented by Alderman W. E. Bean, and £35 in cash. These honours were won by Mr. W. HOLMES,

FIG. 89.—SOUTHPORT SHOW: CHAMPION DECORATED TABLE OF FRUIT.
Exhibited by the Duke of Newcastle.

majority of classes, and, although Orchids were exhibited considerably and well, it was regrettable that there was only one exhibitor in each of the classes provided.

The avenue of groups arranged for effect presented a fine sight; Roses were well displayed, fruits were uncommonly good, Gladioli made huge splashes of colour, Carnations have seldom been seen in finer condition, floral designs excited a great deal of attention and the rock gardens were, as usual, a fine feature.

The non-competitive exhibits were of a high standard of merit, the outside gardens being more extensive than usual. Garden furniture, topiary and horticultural sundries contributed to the general interest and effect. Within the big five-spanned tent the leading seedsmen and nurserymen arranged splendid exhibits that would have been considered first-rate even at a Chelsea Show.

All concerned in the conduct of the show are so kindly and courteous that criticisms have to give place to congratulations, and these we offer to every official, because all contributed to the success achieved and got through a vast amount of work in the pleasantest possible fashion, and appeared to thoroughly enjoy doing it. A few of the Southport folk deserve special thanks, i.e., Mr. E. Clayton, who has been Chairman of the Flower

glass building may be built to take the place of the present huge canvas erection. There were two-and-a-half acres of available space under canvas at Southport Show this year!

GROUPS.

The avenue of groups was once again a splendid feature of the Southport Show. There were eleven big groups of artistically arranged plants, one set of foliage plants only, and the other of foliage and flowering plants.

In the class for flowering and foliage plants, the space allowed each competitor is 300 square feet, so this permits of a large, effective and interesting display. The competition for the £50 and the Southport Cinema Trophy which constitute the first prize, was very keen, and these awards were obtained by Messrs. JAMES CYPHER AND SONS with a delightful arrangement of fine Palms, *Acalyphas*, highly-coloured *Codiaeums*, *Caladiums*, *Humeas* and *Begonia Rex* varieties, these forming a grand setting for elegant plants of *Lilium auratum*, *L. speciosum*, *L. s. album*, *Francoa ramosa*, *Gesneras*, *Fuchsias*, *Laelio-Cattleyas*, *Laelia elegans* (two fine plants), *Cattleya Loddegesii*, *Cypripedium Maudiae*, *Oncidium incurvum*, *Dendrobiums* and *Odontoglossums*. Tiny *Coleus*, *Begonias*, *Ferns* and moss made a pleasing finish along the margins.

Second prize was won by Mr. W. HOLMES,

whose *Codiaeums* were very highly-coloured and artistically disposed with *Caladiums*, handsome plants of the bright and elegant *Nandina domestica*, *Alocasias*, *Palms*, *Coleus*, *Dracaenas*, foliage *Begonias* and *Phyllanthus*. The background of this group was particularly well arranged.

Second prize was won by Messrs. JAMES CYPHER AND SONS, whose display lacked colour as compared with the first prize exhibit; there was also a little weakness in the background, but it was a fine group, nevertheless. Third, Sir GEORGE KENRICK; fourth, Mr. W. R. MANNING, and fifth, Mr. T. M. PETCH.

ORCHIDS.

In the competitive Orchid classes there were few competitors; indeed, only one came forward in each class. In the amateurs' division the Vestey Challenge Trophy and first prize were awarded to J. B. ADAMSON, Esq. (gr. Mr. J. Howes), Townley Grove, Blackpool, for a display on a space twelve feet by four feet (Fig. 90). This was a very handsome effort, containing over fifty *Cattleyas*, of which *C. June* var. *Queen Empress*, *C. Vesta*, *C. Hardyana*, *C. H. alba*, *C. Hassellii* alba, *C. Kienasteana* alba, and *C. Lady Veitch* were excellent, while *Laelio-Cattleya Carmencita*, *L.-C. Profusion*, *L.-C. Queen Mary*, and the brilliant *L.-C. Minosa* were con-

spicuous. *Epidendrum vitellinum majus*, *Cypripediums*, *Oncidiums*, *Odontoglossums* and *Odontiodas* were also included.

In the smaller group class the premier award went to G. V. LEWELYN, Esq., Norwood Avenue, Southport, whose exhibit contained *Vanda coerulea*, *Cattleya Hardyana alba*, *Cypripediums* and *Laelio-Cattleyas*.

Mr. ADAMSON was also awarded first prize for six Orchids, for good examples of *Cattleya Lorna* var. *Princess Royal*, *C. Hardyana* var. *Jupiter*, *Laelio-Cattleya Britannia* var. *alba*, *L.-C. Fowleri* var. *Mammoth*, *Cypripedium Rossetti* and *Odontioda Madeline*. The same exhibitor obtained first prize for three Orchids, showing *Odontioda Romany*, *Cypripedium Maudiae* and *Laelio-Cattleya Hassallii alba*.

The Hartley Challenge Cup for a display of Orchids arranged on a space twenty feet by four feet, was awarded to Messrs. J. AND A. McBEAN, who were equally successful a year ago. The display was beautifully arranged, the arching spikes of *Odontoglossums* and *Odontiodas* forming a fine background for splendid plants of *Laelio-Cattleya Profusion* in variety, *Cattleya*

Gladioli and *Poppies* were outstanding features; third, Mr. W. SYDENHAM, Melbourne, Derby.

A splendid class was the one for a group of perennial, annual and bulbous flowers, arranged on a space of 300 square feet. A very fine display by Messrs. M. PRICHARD AND SON, Christchurch, won the first prize and Silver Challenge Cup; in this group there were grand sheaves of *Lilium tigrinum*, *Crinum Powellii*, *C. P. album*, *Poterium obtusum*, *Artemisia lactiflora*, *Kniphofia Lord Roberts*, *Thalictrum dipterocarpum*, *Agapanthus umbellatus* and *Gladioli* in variety. Second prize was won by Messrs. HARKNESS AND SONS, Beadle, whose examples of *Lobelia Tupa*, *Kniphofias*, *Montbretia His Majesty* and *Gladioli* were particularly good; third, Mr. K. THIRKILDSEN.

One big tent was well filled with smaller exhibits of *Gladioli* (very fine), *Roses*, *Phloxes*, annuals, *Hollyhocks*, *Dahlias*, border flowers, *Asters*, *Antirrhinums* and *Sweet Peas*.

ROCK AND WATER GARDENS.

Competition was again keen in the prominent and popular class for a rock and water garden

LTD., Liverpool; fourth, Mr. E. J. RIGG Kew Nurseries, Southport; fifth, Messrs. HODSONS, Nottingham.

ROSES.

The leading Rose class required a display forty feet by four feet. The premier award, including the Winterbottom Cup, was won by Messrs. BEES. LTD., with a very effective group of clean flowers set out in baskets, low bowls and pillars; *Golden Emblem*, *Emma Wright*, *Betty Uprichard*, Mrs. H. Stevens, Dr. Hawksworth, *Venus* and *Mabel Morse* were all shown in quantity in big baskets.

The Challenge Trophy offered for a display of *Roses* on an area of twenty feet by four feet—an open class—was won by Mr. T. ROBINSON, Nottingham, with a brilliant display wherein a big basket of *Sovereign* was the centrepiece. Around this were pillars of *Shot Silk*, *Angele Pernet*, *Donald McDonald*, *Independence Day*, *Lord Charlemont*, *Christine* and Mrs. Henry Bowles.

Mr. J. MATTOCK, Headington, secured the first prize for a group of *Roses* arranged on a

FIG. 90.—SOUTHPORT SHOW: MR. J. B. ADAMSON'S FIRST PRIZE GROUP OF ORCHIDS.

Luigae, *C. Sibyl*, *C. Eleanore*, *C. Aeneas*, *C. Dowiana alba*, *Brasso-Cattleya Ilene*, *Miltonia vexillaria* var. *Queen Alexandra*, *Vanda coerulea*, and the graceful *Oncidium Leopoldii*.

HARDY FLOWERS.

There were three competitors for the trophy presented by the Southport Chamber of Trade, and £20, which formed the first prize in the class for a display of hardy flowers arranged on a space of 300 square feet. Premier honours were made in favour of Messrs. BEES, LTD., who put up one of their first-rate displays of splendidly-grown flowers; the arrangement was grand, and if there was a trifle of crowding this was compensated for by the artistic use of *Kniphofias*, *Liatris pycnostachys*, *Hollyhocks*, *Lilium trigrinum*, *L. speciosum*, *Crinum Powellii album*, and the deep scarlet *Lobelia Huntsman*, all of which were raised well above the masses of *Scabious*, *Pyrethrums*, *Montbretias*, *Gladioli*, *Heleniums* and *Phloxes*. Messrs. G. GIBSON AND Co., Leeming Bar, were second, with a flatter arrangement wherein *Verbascums*, *Phloxes*,

arranged on a space of 750 square feet. The premier award is £75, and the winner is the holder, for the year, of the Southport Corporation Cup. The winners on this occasion, as in 1926, were Messrs. T. R. HAYES AND SONS, Keswick and Ambleside; whose design was a very beautiful one. A tiny stream and little lakelets occupied, irregularly, the centre of the scheme, and the rocks on either side and around were beautifully weathered, with moss, lichen and even tiny plants in position as when they were on the moors. Dark Pines formed a suitable background, while groups of dwarf *Campanulas*, *Primulas*, *Heaths* and various hardy Ferns appeared quite naturally in suitable positions, with here and there a little colony of small, erect *Junipers*, *Pines* and *Cotoneasters*. The whole arrangement was simple, artistic and natural.

The second prize was awarded to Mr. K. THIRKILDSEN, Southport, for a pleasing arrangement wherein *Ericaceous* plants were used freely in the higher portions and *Campanulas* in the lower levels; third, GARDEN SUPPLIES,

space of twenty feet by four feet; he filled this area with bowls and low stands of *Independence Day*, *Shot Silk*, *Mabel Morse*, *Lady Inchiquin*, *Hortulanus Budde* and other good sorts; second, Mr. R. WRIGHT, Formby.

Messrs. S. MCGREDY AND SON, Portadown, secured a trophy and first prize for a new seedling Rose—the deep, rose-pink Mrs. A. R. Barraclough; this firm also showed many others of their new *Roses*, notably *Desmond Johnson*, *Cherry*, *Marion Cran*, *Margaret McGredy*, and *Portadown Cerise*. Messrs. WHEATCROFT BROS. showed the new Rose *Princess Elizabeth* in quantity on this occasion; this has soft yellow, cerise-shaded flowers.

Los Angeles, *Gwynneth Jones* and *Madame Butterfly* were the varieties with which Messrs. WHEATCROFT BROS. led for three baskets of *Roses*. Mr. J. MATTOCK led for three baskets of decorative varieties with Los Angeles, *Betty Uprichard* and Mrs. H. Morse, and the same competitor had the best two dozen blooms, in boxes.

Messrs. THOMAS SMITH AND SONS, Stranraer,

exhibited the best twenty-four exhibition Roses and the best single basket of blooms of one variety, showing the deep crimson Earl Haig.

In the amateurs' section, Mr. G. MARRIOTT won a Silver-gilt Medal and first prize for a representative group of cut Roses displayed on a space five feet by four feet. He had a very brilliant exhibit wherein were numerous excellent flowers of K. of K., Mabel Morse, Gwynneth Jones, Shot Silk and Golden Emblem, all finely arranged.

DAHLIAS.

The best display of Dahlias, set up on a space forty feet by seven feet, was the arrangement made by Mr. H. WOOLMAN, Shirley, Birmingham, whose brilliant group secured a Challenge Trophy and cash award. Tall stands and low bowls of handsome flowers arrested attention, and among large-flowered varieties a few of the finest were Mrs. W. Jackson, Torchlight, Amun Ra, Thos. Hay, President Wilson, Andreas Hofer and R. Troughton, the last a fine buff-pink Cactus variety. Second, Messrs. JARMAN AND CO., Chard, who showed Barbara Jacobs, Andreas Hofer (pink and cream), Lenny, Lucius, and Rosie Supreme, in fine condition.

In another class, for a display of Dahlias shown without the use of artificial supports, Mr. H. WOOLMAN won another Challenge Cup and first prize, and here the outstanding varieties displayed in big stands of a variety were Mrs. E. Cant, Pink Favourite, Ullswater, Menny Carlie, The Clown, Fireflare—a very vivid scarlet—H. B. May, Andreas Hofer and Trentonian, all large-flowered sorts carrying their blooms on fine, long, stiff stems.

GLADIOLI AND CARNATIONS.

Gladioli were exhibited largely in competitive classes and in non-competitive groups, but no better demonstration could be found of the popularity of these easily-grown garden flowers than that afforded by the class for a collection of primulinus varieties and hybrids arranged on a space thirty feet by seven feet, with a maximum height of seven feet above the staging. There were six competitors, the Stevenson Trophy and first prize being won by Messrs. BEES, LTD., with a very fine display of well-grown spikes arranged in baskets of various sizes; second, Messrs. W. ARTINDALE AND SON, Sheffield, who staged capital spikes in blue vases and made a very attractive exhibit; third, Messrs. HEWITT AND CO., Solihull; fourth, Messrs. W. J. GARNER AND SON.

Mr. MAIR is a wonderful grower and raiser of large-flowering Gladioli, but he defeated himself on this occasion by failing to observe that Class 9 required a display "for effect" on a space of 100 square feet. He had the finest flowers and the finest spikes, but his arrangement was extremely poor, and so he was unplaced. The first prize was awarded to Messrs. BEES, LTD., who displayed good spikes in great sheaves and baskets, and disposed the whole effectively; second, Messrs. W. ARTINDALE AND SON; third, Messrs. HEWITT AND CO.; fourth, Mr. H. PRINS. In this class a clear space of two feet between the various exhibits would have increased immensely the effectiveness of the displays as a whole.

Mr. CHARLES WALL led for a display of Carnations on a space ten feet by four feet, and won a Challenge Cup with a brilliant group of Topsy, Sunstar, Laddie, Saffron, Mrs. C. W. Ward, White Wonder and Mrs. Ives, all represented by handsome blooms; second, Messrs. KEITH LUXFORD AND CO., Sawbridgeworth.

SWEET PEAS, PANSIES AND VIOLAS.

An interesting competition was the one where the competitors had to fill a table, twelve feet by six feet, with Sweet Peas arranged in any kind or kinds of receptacles. There were five entrants, and the winners of the Rowntree Challenge Cup and first prize were Messrs. W. SCOTT AND SON, Snyal, Cheshire, whose bold display, chiefly in baskets and bowls, was very effective. For the time of year, the flowers were clean and good, and such varieties as Ivory Picture, Sybil Henshaw, Royal Pink, Powerscourt, Elegance, Charming and Fortune were capitally shown. Second, Messrs. HERD

BROS., Penrith; third, Mr. W. WEAVER, Mold; equal fourth, Mr. W. E. SANDS, Lisburn, N. Ireland, and Mr. R. WRIGHT, Formby.

In other Sweet Pea classes the leading prize-winners were Mr. SIMON RICHARDS, Cefn Mawr, Wrexham; Mr. JOHN WALMSLEY, Ainsdale; Mr. JOHN GRIGOR, Banff, who won the Batty Challenge Trophy, and was leading prize-winner in the "colour" classes; and Miss K. A. HUGHES (gr. Mr. J. F. Hughes), Gresford.

The principal prize-winners in the Pansy and Viola classes were Mr. E. CLEGG, Dewsbury; Mr. F. DENTON, Dewsbury; Mr. W. INGRAM, Great Barr; Messrs. SANDERSON AND UPTON, Sheffield; Mr. J. S. JACKSON, Whaley Bridge; Mr. G. A. FIDLEY, Stockport; Mr. HERBERT BAIRSTOW, Bradford—invariably a leading prize-winner in classes for show Pansies and Violas; Mr. J. MATHEWS, Pumphurst and Mr. H. ROBERTSON, Kelty.

FLORAL DESIGNS.

No fewer than four competitors came forward in the class for a group of floral designs, i.e., baskets, bouquets, bowls, vases and stands

the last showing Gerberas, *Oncidium macranthum* and buff Carnations.

In the bouquet classes, Messrs. W. J. GARNER AND SON led for a bride's and two bridesmaids' designs, the former in white Cattleyas, Gardenias, Odontoglossums and *Francoa ramosa*, and the other two of Gloriosas; second, Mr. W. HALL, Liverpool; third, Mr. C. VICKERS. The last named led for a hand bouquet of coloured flowers, with purple, mauve and white Cattleyas and *Odontioda* sprays; Messrs. A. ADSHEAD AND SON, second.

The best bowl of cut Roses was arranged by Mr. FALCONER, Cheadle Mental Hospital. Miss NIXON had the best decorative basket of Dahlias.

TABLE DECORATIONS.

Table decorations were a large and interesting feature, nearly fifty tables filling the centre of one large tent.

A sumptuously rich design won for Mr. R. F. FELTON the premier award in the class where Orchids only were allowed. There were four competitors. Mr. FELTON's centrepiece had

FIG. 91.—SOUTHPORT SHOW: PORTION OF MESSRS. SUTTON AND SONS' VEGETABLE EXHIBIT. The premier non-competitive display.

of flowers, and here the premier award was made in favour of Mr. R. F. FELTON, Hanover Square, whose beautiful exhibit (Fig. 80) attracted a vast amount of attention and was greatly admired. A few outstanding designs included a mirror framed in mauve Stock, with *Cattleya Hardyana alba* at the top right-hand corner, and a grouping of these flowers at the bottom left-hand corner; a basket of blue Hydrangeas and soft yellow Roses; a vase of Anthuriums (*Andreanum* varieties), *Nepenthes* and *Haemanthus Katherinae*; a basket of the blue *Vanda coerulea* and *Laelio-Cattleya Profusion*; and a gorgeous basket of Cattleyas, *Odontoglossums* and *Cypripediums*.

Second prize went to Messrs. BEES, LTD., who had a capital display that contained a glorious "shoe" of orange Marigolds, with the opening filled with yellow and bronze Chrysanthemums and *Lilium tigrinum*. The telephone cover, composed of brown centres of Rudbeckias, yellow Marguerites and blue Cornflowers, was quaint and delightful; third, Mr. CHARLES VICKERS, Leicester.

The best basket of cut flowers was a gorgeous design in Cattleyas, yellow *Oncidium*s, *Francoa* sprays, Anthuriums, Gloriosas, *Odontioda*s and *Codiaeum* leaves from Messrs. GARNER; second, Mr. J. NIXON, and third, Mr. CHARLES VICKERS,

a base of white and yellow Cattleyas with a few small spikes of red *Odontioda*s and a couple of *Cypripediums* rising well above the rest. The upper part was composed of yellow Cattleyas which formed a base for arching sprays of *Odontioda*s, *Cochlioda Noetzeliana*, and two spikes of Brassias. Two of the corner-pieces consisted of yellow Cattleyas of the Venus type, with short spikes of *Odontioda*s and *Oncidium*s; the two other corner-pieces consisted of mauve-purple Cattleyas and *Cypripedium niveum*. Except that the corner-pieces were a trifle too large for the size of the table, we have nothing but congratulations to offer the wizard of Hanover Square on this wonderfully beautiful table decoration which also secured the Championship Trophy as the finest table decoration in the whole Show.

Miss NELLIE GIBSON, Welbeck, Worksop, was a good second to Mr. FELTON, and she had a fine arrangement of purple and mauve Cattleyas, with *Cypripedium Maudiae*, *Odontioda*s and *Oncidium incurvum* added in the centrepiece. Third prize was awarded to Mrs. J. NIXON; and fourth to Mrs. CHARLES VICKERS.

In a class where the selection of flowers was optional, Mrs. JOHN NIXON led with a light and pleasing arrangement of small, golden plumes

of Celosias, Gloriosas, Francoa, Humea sprays and Selaginella; Mr. S. WARREN, Darwen, second.

The best table decoration of Roses only was a charming set of low bowls of the lovely Emma Wright, arranged by Mrs. COURTNEY PAGE, Enfield; the half-dozen fronds of Maidenhair Fern were totally unnecessary in this beautiful design. Second, Mrs. JOHN NIXON; third, Miss NEWSHAM.

Mrs. JOHN NIXON led for a table decoration of Pansies and Violas and showed how prettily those flowers may be arranged. Mrs. JOHN NIXON also secured premier honours in another optional class, where she made good use of Montbretias and red Honeysuckle. Miss N. WARREN second, with Orchids, Gerberas and Gloriosas. Mr. S. WARREN was successful in another table decoration class.

COLLECTIONS OF FRUITS.

Among four competitors in the class for a decorated table of fruit, the new trophy offered by the Southport Hotels Association, and the first prize of £30, were won by the DUKE OF NEWCASTLE (gr. Mr. S. Barker), Clumber, Work-sop, with a total of 205½ points. This was a grand exhibit (Fig. 89) of Muscat of Alexandria, Appley Towers and Madresfield Court Grapes, Peregrine and Bellegarde Peaches, Humboldt Pineapple and Dryden Nectarines, Cox's Orange Pippin and Ribston Pippin Apples, White Marseilles Figs, Triomphe de Vienne and Souvenir du Congrès Pears, Jefferson Plums and Melons. In all there were twenty-four dishes of first-class fruit, decorated with blush Carnations and sprays of Francoa ramosa.

LORD BELPER (gr. Mr. Jas. McCarthy), Kingston Hall, Derby, came second with 172½ points, showing finely-finished Muscat of Alexandria and Gros Maroc Grapes, good Peaches (Sea Eagle, very fine), Nectarines, Pears, Plums, Apples and Melons; third, EARL BALFOUR (gr. Mr. G. Anderson), Whittinghame, Haddington, with 164½ points, his set including Black Hamburg and Appley Towers Grapes and Souv. du Congrès Pears in fine condition. Fourth, LADY CUNLIFFE LISTER, (gr. Mr. Bernard Gray), Swinton Park, Masham, Yorkshire, with 148½ points; this exhibit contained handsome clusters of Lady Hutt and Madresfield Court Grapes.

The best table of British or foreign fruit was submitted by Mr. T. MAWDSLEY, Southport, who showed a handsome table of Pineapples, black and white Grapes, Peaches, Nectarines, Canteloupe and English Melons, Oranges, Pears and Apples, nearly all arranged in gilded baskets. Second, Messrs. M. WRIGHT, Ltd., Southport; third, Miss NEWSHAM, Aughton.

There are great possibilities in a class for a basket of British and/or foreign fruit, but neither of the three competitors appeared to take full advantage of their opportunities to produce an artistic effect. Mr. MAWDSLEY won the first prize with a large flat basket containing Pineapples, Peaches, Melons, Grapes, Pears, etc.; second, Messrs. BEES, LTD.; third, Messrs. M. WRIGHT, LTD.

GRAPES.

The new Trophy presented by the Mayor of Southport, E. H. Hibbott, Esq., together with a cash award of £25, made up the first prize won by the DUKE OF NEWCASTLE for twelve bunches of Grapes in not fewer than four varieties. The collection consisted of heavy, large-berried, well-finished bunches of Muscat of Alexandria (11), 10, 9, 10 and 8½; Madresfield Court (10), 8, 8, 8½ and 9; Chasselas Napoleon (9), 7½ and 7½; Appley Towers (11), 8; Frankenthal Hamburg (10), 9½; total 103½ points out of a possible 121—the figures within brackets indicate the maximum possible. This was a grand lot of Grapes.

Mr. DONALD McINNES, Glamis Castle Gardens won the second prize with 101 points out of a possible 122, his Muscats being finely coloured; third, Mr. S. GORDON, Monreith Gardens, Whauphill, with 97½ points out of a possible 117; fourth, the KIPPEN VINEYARD CO., Forth Vineyard, Kippen, with 86 out of a possible 121 points; fifth, Captain FRANCE HAYHURST,

(gr. Mr. A. H. Hall), Bostock Hall, Middlewick. The whole display in this class was one of the finest we have seen for some time past.

For four bunches of Grapes, Mr. W. TIZZARD, Kirklington Hall Gardens, Newark, led with good bunches of Muscat of Alexandria and Alicante; second, W. WATSON, Esq. (gr. Mr. David Andrie), Dunlop House, Dunlop, Ayrshire; third, F. G. MOORE, Esq. (gr. Mr. J. McGeogan), Billown, Castleton, Isle of Man.

Mr. D. McINNES led for one bunch of black Grapes (for bloom) with a small, large-berried bunch of Gosford Black; the DUKE OF NEWCASTLE, second, with Madresfield Court.

The best pair of bunches of Black Hamburg Grapes were shown by Col. M. HUGHES, Sherdley Hall, St. Helens (gr. Mr. J. Holland); second, Mr. S. GORDON. Col. HUGHES had also the best bunch of Black Hamburg. The DUKE OF NEWCASTLE led for a pair of bunches of Madresfield Court with well finished clusters; Mr. S. GORDON, second.

Alicante Grapes were best shown by Mr. S. GORDON, with Mr. TIZZARD second. For any other black Grape, Mr. S. GORDON led with heavy bunches of Alnwick Seedling; Mr. McINNES second, with Gros Maroc.

The best pair of bunches of Muscat of Alexandria Grapes came from the DUKE OF NEWCASTLE, and they were medium-sized, highly-coloured clusters; second, Mr. W. TIZZARD. LORD BELPER showed the best single bunch of any white Grape—Muscat of Alexandria—while for any other white variety, Mr. S. GORDON led with Golden Hamburg; Mr. TIZZARD, second, with Buckland Sweetwater.

T. HENSHAW, Esq. (gr. Mr. J. George), Roby, showed the finest dish of Peaches (Sea Eagle), and Mr. A. MASON was first for Nectarines with fine examples of Humboldt, and also first for Plums with Coe's Golden Drop. Mr. J. DRAKE, Market Rasen, had the best Apples, and the DUKE OF NEWCASTLE the best dish of Pears.

VEGETABLES.

Vegetables were shown in fine condition both in the classes for collections and those for single dishes.

The open championship class for twelve distinct kinds of vegetables attracted a keen competition, and aroused a great deal of interest. The first prize in this class is £10 and a Silver Challenge Trophy presented by J. Larking, Esq. These were won by Mr. JAMES GIBSON, Welbeck, Work-sop, with a handsome collection in which the Carrots, Beets and Parsnips were models of perfection in regard to form and freedom from blemish, although they were not unusually heavy examples. Ailsa Craig Onions, Snow-White Celery, Arran Chief Potatos, Cauliflowers, Tomatos, Runner Beans, Phenomenon Peas, Cucumbers and Leeks completed a splendid set. Second, VISCOUNT HAMBLETON (gr. Mr. Turnham), Greenlands, Henley; third, Mr. W. ROBINSON; fourth, Mr. E. ALTY.

Various seedsmen provide the prizes in certain classes for vegetables, and in these classes the competition was good, and the produce well-grown and capitally displayed.

For Messrs. James Carter and Co.'s prizes, Mr. A. FALCONER, Cheadle Mental Hospital, led for nine distinct kinds; Mr. F. EMMOTT, Lancaster, second. For Messrs. Clibran's prizes, Mr. W. ROBINSON, Garstang, and Mr. FALCONER, were first and second respectively. VISCOUNT HAMBLETON, Mr. JAMES GIBSON and Mr. F. EMMOTT won, as placed, the prizes offered by Messrs. Sutton and Sons. Mr. FALCONER and Mr. EMMOTT were placed first and second respectively for Messrs. Clucas's prizes, while Mr. W. ROBINSON and Mr. J. C. BATTERSBY, Blackburn, were the most successful competitors in the class provided by Messrs. Toogood and Son.

Mr. W. ROBINSON again won the trophy and first prize offered for the best collection of six distinct kinds of vegetables, in a class for amateurs and others residing within twenty-five miles of Southport Town Hall; second, Mr. E. ALTY, Ormskirk.

Competition was keen in the class for not fewer than ten heads of Cauliflower Champion

of England, Messrs. J. L. Clucas, Ltd., offering the prizes. Some very fine heads were displayed, the best being shown by Mr. G. RIMMER; second Mr. J. BATTERSBY.

Potatos were splendidly shown, especially in the class for a collection of twelve distinct varieties immune from wart disease. Mr. E. TAYLOR, Malpas, secured the chief prize with fine specimens of Edzell Blue, Di Vernon, Ally, Sefton Wonder, King George, Bishop, Catriona, Witch Hill, Majestic, Katie Glover, Arran Comrade and Dobbie's Unique; second Mr. H. J. JONES, Rustington.

The first of the prizes offered by Garden Supplies, Ltd., for three dishes of Potatos, was won by Mr. G. HILLING, Lowestoft, with fine examples of Majestic, Arran Comrade and Sefton Wonder.

SPECIAL CUPS AND TROPHIES.

"The People" Challenge Trophy.—To Messrs. SUTTON AND SONS, for the best non-competitive exhibit in the show (Fig. 91). This exhibit was a grand one of splendid vegetables set up in first-rate style.

Brunner Trophy.—To Messrs. JAMES CYPHER ADN SONS, Cheltenham, for the best competitive exhibit in the show.

Scenic Railway (Southport) Trophy.—To Messrs. T. RIVERS AND SON, Sawbridgeworth, for the best exhibit of pot-grown fruit trees and fruits in the show, competitive or non-competitive.

Boothroyd Challenge Trophy.—To Messrs. KENT AND BRYDON, Darlington, for the best formal garden in the show.

MEDAL AWARDS.

Special Gold Medal.—This award was made by the Show Committee to Messrs. JAMES CARTER AND Co., for their combined display of flowers, Melons and vegetables; to Messrs. W. H. GAZE AND SONS, LTD., Kingston, for their Japanese water-garden and tea-house (Fig. 79); and to the DIRECTOR OF EDUCATION, Preston, Lancashire, for an educational exhibit of plant diseases, grafting, manurial experiments, etc.

Large Gold Medal.—To Messrs. BLACKMORE AND LANGDON, Twerton, for Begonias—a splendidly-grown lot of Begonias, the varieties and flowers wonderful; to Messrs. JAMES CARTER AND Co., for a grand exhibit of vegetables, representing a very fine range of kinds, all grown in fine style and arranged on stands and tables in a distinct and attractive manner (Fig. 92); grand Melons in great variety were also shown; Messrs. DICKSON AND ROBINSON, Manchester, for a brilliant exhibit consisting chiefly of high-class Dahlias in great variety and Gladioli; Messrs. C. ENGELMANN, LTD., Saffron Walden, for one of the best and most extensive displays of perpetual-flowering Carnations ever put up; Messrs. KENT AND BRYDON, for an extensive and well-designed formal garden in the open; the KINGS ACRE NURSERIES, Hereford, for a collection of splendidly-grown and freely-cropped fruit trees in pots; the KINGS ACRE NURSERIES, for Roses, early Chrysanthemums and Dahlias; Messrs. T. RIVERS AND SON, Sawbridgeworth, for a famous collection of fruit trees in pots—Peaches, Nectarines, Oranges, Lemons, Citrons, Grapes, Pears and Apples; Messrs. SUTTON AND SONS, Reading, for their grand display of vegetables; Mr. W. J. UNWIN, Heston, for an unusually beautiful group of varieties of primulinus Gladioli; Messrs. R. WALLACE AND Co., Tunbridge Wells, for their Mirror Pool Garden—a great attraction among the outdoor exhibits; and to Messrs. E. WEBB AND SONS, Stourbridge, for a big and brilliant exhibit of hardy flowers consisting of over one hundred varieties.

Gold Medals.—To Messrs. ALLWOOD BROS., for Carnations and hybrid Pinks; Messrs. R. BOLTON AND SON, Birdbrook, for Sweet Peas; Messrs. JAMES CARTER AND Co., Raynes Park, for a huge garden of Asters, Begonias, Lilliums, first-rate Gloxinias, Gladioli, Celosias, Ferns and Palms, with a large fountain in the centre; Messrs. ALEX. DICKSON AND SONS, Newtownards, for a very large and attractive exhibit of beautiful Roses, Sweet Peas, and Carnations; Messrs.

CHARLESWORTH AND Co., Haywards Heath, for a large, choice and well arranged collection of Orchids; Mr. H. J. JONES, Lewisham, for a large collection of herbaceous Phloxes, including many new varieties, Kniphofias and Dahlias.

Silver-gilt Medal.—To the BACKHOUSE NURSERIES, York, for rock garden and alpine plants; Messrs. BARR AND SONS, Covent Garden, for a capital collection of well-grown vegetables; Messrs. DANIELS BROS., Norwich, for a bright group of Gladioli and border flowers in variety; Messrs. DOBBIE AND Co., Edinburgh, for excellent Potatoes in variety, all admirably staged; Messrs. A. J. KEELING AND SON, Bradford, for a pleasing exhibit of Orchids; Mr. ROBERT LAWRIE, Carnwath, for Begonias in pots; Mr. JAMES MACDONALD, Harpenden, for a characteristic elegant and restful grass garden; Messrs. JOHN PEED AND SON, Norwood, for a display of stove and greenhouse plants; Mr. AMOS PERRY, Enfield, for an interesting water garden, bog plants and hardy Ferns and border flowers; Mr. L. R. RUSSELL, Richmond, Surrey, for Clematis and other hardy climbing plants;

ROYAL HORTICULTURAL.

AUGUST 30.—The fortnightly show of this Society at Vincent Square, Westminster, was distinctly brighter and more important than has been usual at this time of the year. The outstanding floral exhibit was the large and very comprehensive display of aquatics and allied plants arranged by Mr. AMOS PERRY. Other noteworthy floral features were China Asters, herbaceous Phloxes, general border flowers and Roses. Orchids were not largely shown, but there were several very good novelties. There was an excellent display of fruit trees and gathered fruits and several smaller exhibits of various fruits.

Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Secretary), Mr. S. Low, Mr. Fred. K. Sander, Mr. H. G. Alexander, Mr. A. Dye, Mr. Charles H. Curtis, and Mr. Richard Ashworth.

FIRST CLASS CERTIFICATE.

Laelio-Cattleya Canberra (C. *Venus* × L.-C.

Phalaenopsis var. *Schröderianum*, *Odontioda* *Melita* *Sophro-Laelio-Cattleya Katrina*, the handsome *Cypripedium Cranmore*, *Miltonia* *Venus*, the dainty white, gold-masked *M. gatttonensis* and *Masdevallia Lowii*.

Messrs. SANDERS contributed *Phalaenopsis* *violacea*, *Cypripedium Godefroyae*, *Cattleya* *Etta* var. *conspicua*, the handsome, bronze and purple C. *Thebes* var. *Luxor*, and a plant of *Odontoglossum grande* carrying eleven fine flowers.

J. J. BOLTON, Esq., Claygate, showed the fine chocolate and pink *Odontoglossum Matador*, and Messrs. H. ALEXANDER, LTD., sent a beautiful plant of *Laelio-Cattleya* Mrs. Chamberlain Chanler, *Westonbirt* var., with a spike of five handsome flowers. An exceptionally fine Butterfly Orchid—*Oncidium Papilio* var. *Atlas*—was shown by R. ASHWORTH, Esq., Newchurch; it carried two splendid flowers and is undoubtedly the finest form of this Orchid.

MESSRS. J. COWAN AND Co. exhibited two plants of *Laelio-Cattleya Canberra* (C. *Venus* × L.-C. *Litana*), each carrying one superb flower of rich golden orange colour, with ruby,

FIG. 92.—SOUTHPORT SHOW: PART OF MESSRS. JAMES CARTER AND CO.'S GOLD MEDAL EXHIBIT OF VEGETABLES.

Mr. T. SMITH, Daisy Hill, Newry, for rare shrubs and hardy flowers; Messrs. STUART LOW AND Co., Enfield, for Orchids; Messrs. TOOGOOD AND SONS, Southampton, for a representative collection of vegetables and hardy flowers; Messrs. JAMES VERT AND SONS, Saffron Walden, for stately spikes of fine varieties of Hollyhocks, admirably arranged in elegant vases; and to the Hon. G. E. VESTEY, The Warren, Birkdale, for a group of Orchids and foliage plants.

Silver Medal.—To Messrs. BAKERS, Codsall; Messrs. R. H. BATH, Wisbech; Messrs. W. BROWN AND SON, Ormskirk; Mr. H. CLARKE, Taunton; Mr. J. EVANS, Colwyn Bay; Messrs. EVANS AND SON, Peterborough; Messrs. E. F. FAIRBAIRN AND SONS, Carlisle; Messrs. JOHN FORBES, LTD., Hawick; Messrs. W. H. GAZE AND SONS; Mr. ROBERT HAYES, Grasmere; Messrs. P. JOHNSON AND SONS, Southport; Mr. J. KLINKERT, Richmond; Mr. ROBERT MASON, Gateacre; Messrs. MIDDLEHURSTS, LTD., Liverpool; Mr. H. PRINS, Wisbech; Messrs. W. H. SIMPSON AND SONS, Birmingham; Mr. SYDNEY SMITH, Enfield (Cacti); Mr. ROBERT SAUL, Preston; Mr. W. WELLS, Merstham; and Mr. E. H. WILLIAMS, Broad Green, Liverpool.

Litana).—A very handsome hybrid in which the broad petals and sepals are rich golden-orange and the lip shaded with crimson where the gold lines extend from the throat; the apex is ruby, edged with rose. Shown by Messrs. COWAN AND Co.

AWARD OF MERIT.

Laelio-Cattleya Mrs. Chamberlain Chanler *Westonbirt* var. (L.-C. *Lustre* × L. *purpurata*).—A very attractive Orchid with bright, violet-purple sepals margined with mauve; pale mauve-purple petals, and deep, rich Tyrian-purple lip. Shown by Messrs. H. ALEXANDER, LTD.

GROUPS.

In the small group submitted by Messrs SUTTON BROS. there were such interesting Orchids as *Epidendrum prismatocarpum*, *Cypripedium Maudiae*, *Cattleya Mossiae* var. *Reineckiana*, C. *Thebes*, *Laelio-Cattleya Salonica*, the old *Odontoglossum Harryanum* and various *Miltonias*.

MESSRS. CHARLESWORTH AND Co. showed a small group that contained pleasing examples of *Cattleya Hardyana alba*, C. *Iris*, C. *Helga*, C. *Lord Rothschild*, the pure white *Dendrobium*

rose and gold lip. The flowers were of fine size, form and substance.

Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. Arthur Turner, Mrs. Ethel M. Wightman, Mr. A. E. Vasey, Mr. H. J. Jones, Mr. James B. Riding, Mr. J. M. Bridgeford, Mr. M. C. Allwood, Mr. Courtney Page, Mr. D. Ingamells, Mr. Wm. Howe, Mr. Hugh Dickson, Mr. Donald Allan, Mr. George Churcher, Mr. D. B. Crane, Mr. E. R. Janes, Lady Helen Lindsay Smith, Mr. Charles E. Pearson, Mr. G. W. Smith and Mr. W. D. Cartwright, Secretary.

Section B.—Mr. Charles T. Musgrave (in the chair), Mr. W. G. Baker, Mr. T. Hay, Mr. L. R. Russell, Mr. W. B. Cranfield, Mr. Mark Fenwick, Mr. E. H. Wilding, Mr. James Hudson, Mr. E. A. Bowles, Mr. Amos Perry and Mr. N. K. Gould, Secretary.

AWARDS OF MERIT.

Lobelia cardinalis var. *Huntsman*.—This is a very vigorous and showy variety. The stout, purplish stems and green leaves have the pubescence which is usually associated with

Lobelia fulgens. The flowers, which are freely produced, are of deep, rich scarlet colour. A large quantity of this very desirable variety was exhibited at the Southport Show last week. Shown by Mr. A. J. MACSELF, Domaris, Reading.

Montbretia Lady Wilson.—A very good, large-flowered variety of bright yellow colour, with a sheen of orange.

Montbretia R. C. Notcutt.—This is also a large-flowered variety, and its colour is a deep, fiery orange paling to a clear yellow in the centre of the flower. Both varieties were shown by the Hon. Mrs. MONTAGUE (gr. Mr. J. G. Fitt), Breeches Hall, Attleborough.

FOR TRIAL AT WISLEY.

Lobelia fulgens The Bishop, a very vigorous, half-hardy, herbaceous variety, with bright purple stems and foliage and crimson flowers. Sent by the Hon. and Rt. Rev. B. J. PLUNKET, St. Annes, Clontarf, Dublin. *Gladiolus* Langport Triumph, sent by Messrs. KELWAY AND SON, is a large-flowered variety bearing vivid, clear red flowers which have a creamy-yellow throat. *Aster Rogers's* Californian Giant strain appears to be an exceptionally vigorous strain of *Ostrich Plume China Aster*. The large flowers are very shapely and were shown in distinct shades of rose, rose-pink, blue and white. It was sent by Messrs. C. ENGELMANN, LTD.

DAHLIAS FOR TRIAL.

The joint Dahlia Committee met during the morning and selected the following novelties for trial at Wisley.

Marmot.—A miniature Decorative variety of bright rose-pink colour, flushed with gold at the centre.

Nanette.—A large Decorative variety of bright mauve colour with a nearly white centre.

Saxon.—A long-stemmed Cactus variety of clear yellow colour, with an amber shading on the outer florets.

Golden Rod.—A well-set-up Cactus variety of clear yellow colour.

Mrs. C. Hancock.—An attractive Cactus variety in which the bright carmine florets are undulated.

Stedfast.—A bright, orange-crimson Cactus variety. The above were shown by Messrs. J. STREDWICK AND SON.

Red Rover.—A bright crimson Camellia-flowered Dahlia.

Lowfield Maroon.—A reddish-maroon Camellia-flowered variety.

Mermaid.—A yellow, miniature Paeony variety. These three Dahlias were shown by Messrs. J. CHEAL AND SONS.

GROUPS.

A very extensive exhibit of exceptional interest and value was arranged by Mr. AMOS PERRY. In the centre he had many flowers of some of the best *Nymphaeas* of the *Marliacea* type floating in a long, shallow pool, backed by such handsome-foliaged bog plants as *Xanthosma violacea*, *Thalia dealbata*, *Pontederia lanceolata* and, at the ends, groups of *Cannas*. The chief *Nymphaeas* were *N. Marliacea rosea*, *N. Eucharis*, *N. Gladstoniana*, *N. Frobili* and *N. Rose Nympe*, the last-named of a very uncommon appearance. The petals are of delicate blush rose colour, and the stigmas are tipped with orange, making a distinct zone in the centre of the flower. This centre of *Water Lilies* was flanked by an exceptionally complete collection of Reeds, Rushes and other water-loving plants, while at intervals Mr. PERRY had placed glass bowls of many floating aquatics, such as species and varieties of *Elodea*, *Hottonea*, *Cabomba* and *Potamogeton*. Additional interest was centred in these bowls by the little fishes swimming around in them. Besides small, golden carp there were sun-fishes, cat-fish, bitterling and golden orfe.

On a large floor space at the other end of the hall, Messrs. SUTTON AND SONS well illustrated the value of the many types of *China Aster* (*Callistephus hortensis*). This extensive exhibit made a gorgeous colour display and included batches of *Ostrich Plume*, *Giant Comet*, *Giant Ray*, *Victoria*, *Anemone-flowered*, dwarf *Chrysanthemum-flowered*, *Mammoth*, *Giant French*, and other types of the double-flowered varieties,

together with *Southcote Beauty* and some splendid single *Asters* of rich colours.

Herbaceous *Phloxes* were again shown in quantity by Mr. H. J. JONES. On the present occasion he had profusely-flowered plants of *Dr. Koningshofer*, vivid orange-red; *Fair to See*, pale pink; *Mrs. A. G. Cross*, salmon; *Mrs. Curwen*, bright salmon; *Winnie Magor*, rosy-lilac; and *Le Mahdi Improved*. In addition to the *Phloxes*, Mr. JONES showed *Tritomas*, *Helianthus Monarch* and *Dahlias*. A collection of herbaceous *Phlox* was also shown by Messrs. E. F. FAIRBAIRN AND SONS, whose varieties included *Triumph*, purple; *Attraction*, salmon; *The King*, bright purple; *Border Gem*, rosy-purple; and *Eden*, salmon. A neat collection of general border flowers set up by Messrs. WILLIAM KEEP AND CO., included herbaceous *Phloxes*, *Lupins* and *Asters*, and they also had an attractive little rock garden.

Mr. H. HEMSLEY again staged a collection of his new *Sidalceas*, which included several seedlings and some good named varieties.

In an attractive corner exhibit, Messrs. M. PRICHARD AND SONS displayed herbaceous *Phloxes*, *Tritomas*, *Delphiniums*, *Crinum Powellii* and *Poterium obtusum*. Messrs. J. CHEAL AND SONS staged such varieties of herbaceous *Phlox* as *Partheon*, *Grevin*, *Baron Heckeren*, *Europa* and *Avalanche*, and also had a collection of *Dahlias* of the *Cactus*, *Decorative*, *Star*, *Paeony* and *Pompon* types.

Mr. F. G. WOOD had an interesting and well arranged collection of seasonal border flowers, amongst which were *Veronica subsessilis Hendersonii*, a dwarf-growing variety, bearing large spikes of intense blue flowers, *Tradescantia virginica rosea* and *Pentstemon Kellermannii*. The Misses HOPKINS had a pretty little rock garden. Messrs. DOBBIE AND CO. staged especially well-grown examples of *African Marigolds* *Prince of Orange* and *Lemon Queen*, bordered by the dwarf *Legion of Honour*.

Exceptionally tall stems of *Lilium tigrinum splendens giganteum* in the exhibit of Messrs. R. GILL AND SON attracted attention and this firm also showed sprays of *Clethra arborea*, *Berberidopsis corallina*, *Desfontainea spinosa*, *Lepageria rosea* and *Lambertia formosa*. Messrs. ISAAC HOUSE AND SONS had several very showy *Tritomas*, especially *T. nobilis* and *T. erecta*, and a good collection of their *Scabiosa caucasica* varieties.

With a central row of *Dicksonia antarctica* and various ornamental vines, Messrs. L. R. RUSSELL, LTD., grouped many pots of *Clematis*, including the varieties *Comtesse de Bouchard*, a free-flowering pink; *Mrs. Cholmondeley*, sparkling lavender; *Jackmanni rubra* and *Marie Bouscelor*, a large white flower.

Goodly collections of greenhouse *Carnations* were displayed by Messrs. C. ENGELMANN, LTD., and by Messrs. ALLWOOD BROS. The former had vivid vases of *Red Laddie*, *Rouge* and *Spectrum*, while the latter included *Laddie*, *Canadian Pink* and *Master M. Stoop*.

Generously filled vases of *Roses* were arranged by several growers. Mr. J. H. PEMBERTON showed *Pax*, *Los Angeles*, *Mermaid* and *W. F. Dreer*. Messrs. B. R. CANT AND SONS included *Mrs. Herbert Stevens*, *Mrs. Beatty* and *Etoile de Hollande*. Messrs. D. PRIOR AND SON showed *Betty Uprichard*, *Else Poulsen* and *Mrs. Henry Bowles*, and Messrs. FRANK CANT AND CO. had good specimens of *Los Angeles*, *Betty Uprichard*, *Golden Emblem* and *Salmon Spray*.

An extensive collection of very fine *Gladioli* was again displayed by Messrs. KELWAY AND SON; Messrs. R. H. BATH, LTD., and Messrs. H. LANGRIDGE AND CO. also had good exhibits of the same flower.

Fruit and Vegetable Committee.

Present: Mr. J. Cheal (in the chair), Mr. E. A. Bunyard, Mr. W. H. Divers, Mr. George F. Tinley, Mr. E. Beckett, Mr. H. Markham, Mr. A. Metcalfe, Mr. A. Bullock, Mr. J. C. Allgrove and Mr. F. Jordan.

Mr. E. A. Bunyard showed fruits of *Plums* *Bèjonnières* and *Gordon Castle*. The former variety was raised one hundred years ago, but is little known in this country. It is a round, golden Plum of superb appearance, but the quality is disappointing. *Gordon Castle* is also

a golden variety and of a curious pyriform shape. This variety does well in the north, and may be valuable for northern gardens.

Mr. J. C. ALLGROVE exhibited pot fruit trees and dishes of *Plums*. The majority of the trees were *Plums*, but they included a few of *Lady Sudeley Apples* and *Williams's Bon Chrétien Pears*, together with a very finely trained *Peach* tree as a centrepiece at the back. The *Plum* trees bore large crops of such varieties as *Belgian Purple*, *Jefferson*, *Allgrove's Superb*, *Count Althan's Gage*, *Giant Prune*, *McLaughlin's Gage*, *Victoria*, *Greengage* and *Early Transparent*. The gathered fruits were superb specimens of *Kirke's Blue*, *Jodoigne Green Gage*, *Early Transparent*, *Denniston's Superb*, *Washington*, *President* and others.

Mr. H. HEMSLEY showed a small collection of fruits which included good specimens of *Lady Sudeley*, *Worcester Pearmain*, *Early Victoria* and *Miller's Seedling Apples*.

Mr. J. J. KETTLE again exhibited *Raspberries*, and Messrs. LAXTON BROS. The *Veitchberry*.

ANSWERS TO CORRESPONDENTS.

GALLS ON ROOTS.—W. F. The specimen of root received for examination bears a cluster of galls caused by an insect, *Biorrhiza aptera*. This insect punctures the roots and lays an egg in each hole. As the larvae develop the galls are formed.

HOLLYHOCK-LEAF RUST.—T. S. The *Hollyhock* leaves are, as you suspect, attacked by rust, caused by the fungus *Puccinia malvacearum*. All diseased leaves should be collected and burnt and the plants sprayed with *Bordeaux* mixture. It has been found that if the fading leaves of diseased one year-old plants are collected, the plants are not attacked by the disease the second season.

MORELLO CHERRY TREES GUMMING.—Miss E. The gumming of your *Morello Cherry* trees is probably due to the soil in which they are growing being too heavy or too rich; if young, healthy *Cherry* trees make gross growth, gumming and canker generally follow. As your trees are young, lift them in October and add plenty of pounded chalk or old lime rubble, road scrapings and burnt garden refuse to the soil. If the drainage is efficient and you follow our advice you should not be troubled further with gumming.

NAMES OF PLANTS.—F. P. The *Orchid* appears to be a form of *Cypripedium Druryi* or an early hybrid from it; the other plant is *Eucryphia pinnatifolia*.—W. E. A. Probably *Lilium chalcodonicum*.—J. C. G. 1, *Ornithogalum longibracteatum*; 2, *Sisymbrium officinale*.—A. T. 1, *Fagus sylvatica* var. *heterophylla*; 2, *Crataegus punctata*; 3, *Acer platanoides* var.; 4, *Fagus sylvatica* var. *variegata*; 5, *Thuya dolabrata*.

POTATO HAULM DISEASED.—H. V. W. The *Potato haulm* forwarded has been attacked by *Potato Blight* (*Phytophthora infestans*) which spreads rapidly in a wet season like the present. Nothing can be done now except to pull or cut off and burn the affected haulm, and to lift the *Potatoes* so soon as practicable.

THE CONTROL OF SLUGS.—G. P. Nothing is more effective for the destruction of slugs than ordinary alum. It may be applied in saturated solution either to water the ground or spray the plants with, without risk of damage. For solutions, lump alum, which is cheaper, may be used instead of the powdered material and it should be dissolved in a suitable vessel by means of hot water; a saturated solution is approximately one pound of alum to one gallon of water. Alum may also be used in the powdered state for the protection of isolated plants in slug-infested ground.

SUPPLEMENTARY PLATE.

Cymbidium Rosanna.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 57.5°.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, September 7, 10 a.m. Bar. 30.1. Temp. 64°. Weather, Sunny.

American Gooseberry Mildew

THERE was a time, and that not so very long ago, when mycologists used to make our flesh creep with dreadful prognostications of the fate awaiting our Gooseberries if this pest were allowed to reign unchecked. These guardians of the health of plants regarded this fungus with so apprehensive an eye that they invoked successfully the penal might of the nation to hold in check its actual and potential ravages. The Destructive Insects and Pests Acts of 1907 came into being as the result of the apprehension of plant pathologists that, despite their skill in preventive plant medicine, the evil wrought by the mildew would prove beyond their powers of control. An interesting brochure might indeed be written on the influence of fungi on the laws of nations. It would cite the Barberry Laws of France and Massachusetts designed—unavailing, of course—to prevent the spread of rust on cereals. It would devote a chapter to the influence of Potato Blight fungus on Sir Robert Peel's sudden conversion to free trade nearly one hundred years ago, and it would not omit

references to American Gooseberry Mildew, which, with other disturbers of the peace of plants, has led many countries to adopt all sorts of measures, often as numerous as they are generally futile—to restrict the importation of noxious fungous and insect pests. This present delinquent, American Gooseberry Mildew, whose depredations have ceased to be serious in most parts of this country, is still apparently at its old tricks in Ireland; so much so, indeed, that the mycologists of the Ministry of Agriculture for Northern Ireland have been at much and successful pains to discover how it may be brought under control*. The Destructive Insects and Pests Acts, which were passed in 1927, give the Department of Agriculture power to deal with pests. The Department set about using its powers; Gooseberry bushes were burned by the hundred thousand—and the disease continued to spread. The principle that "the blood of the martyrs is the seed of the Church" would seem to apply even to fungi, for the more the Ministry of Agriculture persecuted the American Gooseberry Mildew the more it seemed to flourish. Those, however, who looked into the matter with eyes less feverish than those of the official bush burners, soon satisfied themselves that the milder method of good cultivation might do more to eradicate or, at least, check the disease than could be accomplished by the heroic method of burning all the victims of the disease at the official stake. Where bushes are grown as fillers between top fruit and allowed to grow unchecked beneath shade—there the disease makes greatest headway; but where the Gooseberry is well cultivated in open situations in fertile soil and the bushes are restricted by proper pruning, the disease does not flourish. At all events, little is heard now in this country of this once notorious pest. It may be that the climate of northern Ireland is more favourable to the spread of American Gooseberry Mildew than is that of our own. In any case, the prevalence of the disease in northern Ireland is apparently still so considerable as to warrant investigation of the best means of checking it. The fungus, *Sphaerotheca Mors-uvae*, responsible for the disease has, as is well-known, a summer and a winter stage, of which the former is the more vulnerable. Messrs. Muskett and Turner, therefore, devoted their attention to means of destroying the fungus in its summer stage. Experiments made in 1922 showed that the best results in controlling the disease were obtained by the use of ammonium polysulphide with soft soap—the fungicide which, if we remember aright, was advocated by Professor Salmon. Subsequent experiments proved that this fungicide (one part in 199 of water, with 4 lbs. of soft soap per 100 gallons) gave perfect control of the disease, so far as diseased bushes were concerned. Other fungicides, such as lime-sulphur, were also used, but it was found that, on the whole, two sprayings with the polysulphide specific, one immediately after flowering and the other three weeks later, gave the best results. With most varieties, Whinham's Industry, Crown Bob, Whitesmith and Red Warrington, the spray fluid does no injury to the leaves, but with Keepsake, leaf-drop sometimes occurs, and on bushes of Amber, polysulphide must not be used. For these varieties spraying with caustic soda is recommended. To obtain satisfactory results, however, three sprayings with soda are requisite, one in winter (February, 2 per cent. caustic

soda) and two in summer (1 ounce of washing soda per gallon of water). If control of the larvae of Gooseberry Sawfly is also required, the authors recommend spraying twice in summer with a mixture made up of lime-sulphur (1 in 99), 2½ lbs. of lead arsenate paste, plus 5 lbs. of freshly hydrated lime per 100 gallons, or ammonium polysulphide 1 in 199, 2½ lbs. of lead arsenate paste, with 5 lbs. of freshly hydrated lime, per 199 gallons. Either of these mixtures may be used on the following varieties:—Whinham's Industry, Crown Bob, Keepsake, Whitesmith and Red Warrington. The cost of the spraying works out in northern Ireland at from four-and-a-half per cent. to six per cent. of the value of the crop.

Cymbidium Rosanna.—The Supplement Plate accompanying the present issue depicts a very beautiful Cymbidium raised at Westonbirt. The parents of this lovely hybrid are C. Kittiwake and C. Alexanderi, the latter giving it fine form and substance. In C. Rosanna the sepals and petals are a delightful shade of pink, while the labellum shows a combination of rose and rose-pink, with red markings on the broad apical portion. C. Rosanna was shown before the Royal Horticultural Society on March 8 of the present year, by Messrs. H. Alexander, Ltd., Westonbirt, Tetbury, and on that occasion the Orchid Committee granted it an Award of Merit.

The Arnold Arboretum.—Efforts are being made in the United States of America to raise an endowment fund of \$1,000,000 for the Arnold Arboretum. The original endowment of £100,000 was enhanced during Professor Sargent's fifty-four years of service to \$1,125,000. The Arboretum, however, has always had deficiencies to meet and these have, at times, amounted to nearly \$50,000. Although in the past such deficiencies have been made up by the late Professor Sargent personally and his friends, it is now considered necessary to raise a memorial fund to maintain and develop the Arboretum on the lines conceived by its creator and first director.

Rosslyn Orchids.—We remind our Orchid-loving readers that the sale of the late Mr. H. T. Pitt's Rosslyn collection of Orchids will commence on September 12, at Rosslyn, Stamford Hill, and be continued on September 13 and 14, and again on September 20, 21 and 22.

Queen Alexandra Memorial Fund and British Gardens.—We learn that the admirable sum of £6,765 has been added to the Queen Alexandra Memorial Fund as a result of payments made by those who visited the many British gardens thrown open for this purpose. In most cases the charge for admission was one shilling. A few of the larger amounts received from well-known gardens include Leonardslea, £124; Goodwood, £67; Arundel Castle, £108; Welbeck Abbey, £237; Eaton Hall, £166; and Chatsworth, £194. It is probable that the total mentioned will be increased considerably, as several other gardens will be open during the present month. It is a pleasure to record that, although nearly seven hundred gardens were opened to the public on behalf of the Queen Alexandra Memorial Fund, "not a single complaint of litter or inconsiderate behaviour has been received."

Newtownards Flower Show.—We believe that nowhere in the British Isles, except at Newtownards, Co. Down, is a great flower show held in the grounds of a nurseryman. Long ago, in 1854, the Newtownards Show was held on very much the same site as the one held ten days ago in Messrs. Alex. Dickson and Sons' grounds. This year the show was larger than ever, and it was attended by crowds of visitors from Belfast and other towns and villages in the district. Roses and Sweet Peas were particularly good features, and the principal prizes for these and other flowers were pieces of plate, paintings and other useful and valuable items. Plants, Dahlias, annuals and table decorations were other capital sections, while

* The Control of American Gooseberry Mildew in Northern Ireland, By A. E. Muskett, B.Sc., and E. Turner, A.R.C. Sc.I. Journal of the Ministry of Agriculture for Northern Ireland. Vol. I., 1927. Published by H.M. Stationery Office, 1927. Price 2/6.

vegetables, farm crops, honey and dairy produce occupied considerable space. The horse-leaping competitions held during the afternoon proved a great attraction. Mary Lady Clanmorris, Sir Samuel Kelly, Col. R. G. Sharman-Crawford, Sir Trevor Henderson, Capt. S. B. Duffin and Mr. David McAlpine were among the most successful prize-winners. Mr. Alex. Dickson (the President), his brothers and his sons all take an active interest in this big local event, and Mr. David Orr is the capable Secretary. The nurseries were thrown open to the general public, and most of the visitors thoroughly enjoyed the opportunity of inspecting the vast acreage of Roses, the big houses of Carnations and Sweet Peas, the shrubs, fruit trees, Begonias and Dahlias in the Newtownards establishment.

Park Superintendents' Outing.—The members of the London and District Branch of the National Association of Park Superintendents will visit the Royal Horticultural Society's Gardens, Wisley, on Friday, the 16th inst. The party will travel by charabanc, which will leave the Elephant and Castle Hotel at 1 p.m. Tea will be provided at the Hut Hotel, Wisley. Full particulars of the outing may be obtained from Mr. W. H. Johns, Parks Department, St. James' Churchyard, Bermondsey.

The Unseasonable Summer.—Whilst the summer of 1927 will be regarded as one of unusual rainfall, it is not by any means the wettest summer on record. The total rainfall for June, July and August was 11.024 inches, as compared with an average of 7.566 inches, the excess being nearly fifty per cent. over the average. In the summer of 1879, however, the rainfall for the same period was 16.352 inches, when so much as 6.557 inches fell in August, compared with the August rainfall this year of 4.348 inches, which may surprise some to know is 1.690 inch below the average. These facts are given by Mr. W. D. Christmas, of the Records Department, Rothamsted, in the *Times* of Friday, September 2, who states that the rainy season started in the middle of June and spread over ten weeks, and that fifty-three of these seventy days were wet, and at no time were there more than three succeeding days without rain.

A Tree-felling Contest.—A tree-felling competition, open to the western counties, was held on August 30, by the Royal English Arboricultural Society, at Langridge Woods, East Quantoxhead, Somerset. Century-old English Oaks, standing about sixty to eighty feet high, were selected for felling by the competitors, who worked in pairs, representing the counties of Somerset, Devon and Wiltshire. The first prize was won by two brothers, Messrs. F. J. and D. F. Tucker, of Dartington, Devon, aged seventeen and twenty respectively. Mr. Gerald W. E. Loder is President of the Society, and in the morning of the competition he planted a Douglas Fir to commemorate a visit of the Society to the Forestry Commission's plantation on the Quantox estate.

New Park in Germany.—The State of Anhalt in Germany, has lately taken over for the use of the public several parks hitherto in private hands, notably the castle and park of Luisium, the castle and park of Oranienbaum, and the castle of Wörlitz with the parklands formerly belonging to its ducal owner. The palace garden at Dessau has also been made over to the State authorities. These large, new open spaces will be under the control of Herr Hallervorden, who has already taken up residence at Wörlitz. As he had already the supervision of several public gardens in Anhalt, he will have his hands full for some time to come.

International Horticultural Congress in Vienna 1927.—The following programme of excursions has been arranged for those members of the International Horticultural Congress who wish to see some of the principal places of interest in and around Vienna:—Monday, September 19: Meeting at the Kursalon at 7 p.m. Tuesday September 20: Lunch at Rathauskeller; excursion to Schönbrunn and return and reception. Wednesday, September 21: Lunch at

Rathauskeller; excursion to Rothschildgarten Turkenchanspark, Hochschule für Bodenkultur, and reception. Thursday, September 22: Lunch at Rathauskeller; excursions by motor car (1) visit to Vienna gardens; (2) Strebersdorf, Kagran, visit to nurseries; (3) visit to the new tenement houses of the municipality of Vienna (only one tour is possible for each member of the conference). Friday, September 23: Excursion to Baden, near Vienna; lunch at Baden. Saturday, September 24: Lunch at Rathauskeller; visit to Chapter House at Klosterneuburg. Sunday, September 25: Drive to Hochschneeberg; lunch at Hochschneeberg.

Mr. Arthur Allardice.—Mr. Allardice began his gardening career in 1898 under his late father, who was gardener to the Earl of Strathmore, Streatham Castle, Darlington, where both indoor and outdoor flowers were grown in very large quantities. After completing his three years' apprenticeship, Mr. A. Allardice served for three years as journeyman under Mr. Tallett at Raby Castle, where he gained a large and varied experience with stove and greenhouse plants and indoor fruits, including Pineapples, while floral

MR. ARTHUR ALLARDICE.

decorations indoors were a fine feature at Raby Castle in those days. Leaving Raby Castle, he served with Messrs. Mack and Miln in their landscape department, and then became journeyman in the fruit houses under the late Mr. Gribble, Wynyard Park, Stockton-on-Tees, where he stayed three years. His next post was that of foreman under Mr. Flack, Cholmondeley Castle, and two years later he became general foreman under the late Mr. Brock at Goodwood. Here he remained five years, and when war broke out, being keen to join up with the Gordon Highlanders, His Grace the Duke of Richmond, hearing of this, arranged for him to join the 8th Battalion, in 1914. He proceeded to France on May 10, 1915, with the 9th Division, and saw plenty of fighting and was, indeed, dangerously wounded in November, 1915, at Hill 60. After a period in hospital in England, he reported to headquarters in Aberdeen, and, after volunteering three times to join his old Battalion at the front, he was sent out to Arras, in April, 1917, where he was again wounded, and, being unfit for further active service, he was discharged in May, 1918, and returned to Goodwood. Shortly after his return, the Duke of Richmond recommended him as gardener to the Rt. Hon. Viscount Boyle, Brancepeth Castle, Durham. In the following year the place was closed, but his employer wished him to go to Burwarton, Shropshire, of which gardens he took charge on August 7, 1919, and during the past eight years

Mr. Allardice has made many improvements in the pleasure grounds, kitchen gardens and the fruit range. For the past two years Mr. Allardice has judged at the great Shrewsbury Floral Fete and he is now a member of the Committee of the Shropshire Horticultural Society. Romance enters every life, therefore it is interesting to record that Mr. Allardice married the hospital sister who nursed him through his dangerous illness in 1917.

Manchester Parks' Staff Outing.—The annual outing of the Manchester Parks and Cemeteries Staff Society was held this year in London, when 145 of the members and friends inspected the principal parks and open spaces of the metropolis, including Hampstead, Kenwood, Regents Park, Hyde Park, St James' Park, Battersea Park, the large open spaces at Wimbledon and Putney, Hampton Court and Richmond Park. The party also saw many of the chief features in the City, and finished up at Kew Gardens, where they were received by Dr. Hill, the Director, and conducted around the gardens by Mr. J. Coutts and Mr. A. Osborn, Assistant Curators. The visit was the outcome of an invitation extended to the Society by Mr. Parker, F.S.I., Deputy Chief Officer of the L.C.C. Parks on the occasion of a special lecture given during the winter session, and to him the Society is indebted for the very interesting and enjoyable programme worked out in connection with the Hon. Secretary, Mr. L. E. Morgan, N.D.Hort. Mr. Parker accompanied the party throughout the tour.

The London Allotments Show.—An "All London" show of allotment gardens produce has now become an annual fixture, and the sixth of the series, which was held at the R.H.S. Hall, Westminster, on September 2 and 3 last, was in every respect worthy of its predecessors. A few short weeks after last year's show the London Allotments and Gardens Show Society suffered a grievous loss in the death of Mr. J. V. Davis, who had been Secretary for the previous three years. In a quiet but determined way, Mr. Davis had done an immense amount of work for the allotment holders, and the Society has been fortunate in securing such a good successor in Mr. H. A. Treganowan. A wide interpretation is placed on "The London Area," and allotment holders so far from the City as Watford, Lewisham and Southgate compete with those in more urban districts. At this year's show flowers were more largely exhibited than before, and it was interesting to note that the most successful exhibitor came from West Ham. Roses, Dahlias, Gladiolus, Chrysanthemums and general border flowers were most creditably staged, while Sweet Peas were so numerous as to require a special place for their display. This galaxy of Sweet Peas was, no doubt, due to the offer of a medal from the National Sweet Pea Society for the best exhibit, and this was won by Mr. Charles Woodhouse, West Ham, with blooms of outstanding quality. Competition was also very keen in the Society Classes for collections of vegetables. The champion exhibit was staged by the Edmonton Allotment Society, and this included exceedingly good Cauliflowers, Cabbages, Peas, Runner Beans and Potatoes, but the very best exhibit in the show was the first prize collection of six kinds of vegetables grown in a school garden. This class was open to the whole of Great Britain, and the premier collection was shown, for the fourth successive time, by the pupils of the Leybourne Holme School. This exhibit was of splendid quality, the Carrots and Onions being superior to any others in the whole of the show. The Beckenham and District Society produced the best collection of six varieties of Potatoes, and Mr. W. E. Wilson, of Watford, had the best individual collection of vegetables. The varieties of Potatoes most in favour with the exhibitors were Catriona, Arran Comrade, Arran Chief and The Bishop. Runner Beans, Peas, Celery, Shallots, Beet and Parsnips were particularly well grown, but Cabbages were not equal to those of previous shows. One of the outstanding exhibits of the show was the collection of Apples and Pears set up by Mr. E. Anstee, of the Paddington Postal Horticultural

Society. He had fine fruits of Williams's Bon Chrétien Pear, Peasgood's Nonsuch, Emperor Alexander, Worcester Pearmain and Ribston Pippin Apples.

London Gardens Exhibition.—A visit to a horticultural exhibition on Monday last in the Temple Gardens brought back memories of the old days when the spring shows of the Royal Horticultural Society were held there, before they were transferred to Chelsea Hospital Gardens. The exhibition under notice was organised by the *Daily Express* in co-operation with the London Gardens Guild in order to stimulate an interest in gardening in the London area. The numerous exhibits were arranged in long, canvas-covered shelters—like the stalls of a bazaar—with the front open to inspection of visitors, who were so numerous as to make note-taking a matter of difficulty. The show was held on Saturday, Sunday and Monday last, and on the Sunday it was visited by more than 10,000 people. In addition to the competitive exhibits, many well-known nursery firms set up non-competitive groups, so that the exhibition was a thoroughly representative one. It will be remembered that the *Daily Express* offered prizes for the best gardens in the metropolitan area and a replica of the first prize garden was laid out by Messrs. James Carter and Co. There was also a competition for exhibits from the prize winning gardens in which Mr. C. H. Dyke, of Thornton Heath, excelled, his collection including flowers, fruits and vegetables, and indoor as well as out-door flowering plants. There was also a competition for those entrants in the garden competition who did not win prizes. There was a special class for corporate displays from local gardening societies, in which the Camberwell Gardens Guild excelled. Another interesting class was for the London Post Office Horticultural Societies, in which the Mount Pleasant General Post Office showed the premier exhibit. There was keen competition in the class for exhibits from Municipal authorities in the London district, and here the Bermondsey Borough Council was easily first for a display which contained fine Dahlias, Delphiniums, Petunias, Carnations, Lilies and other flowers. Some very good Roses were shown in the Rose classes, and Dahlias also were of excellent quality. Judging from the numerous exhibits of garden flowers, it was obvious that Scabious, Erigerons, Pentstemons, Pansies, Coreopsis, Phloxes, Gaillardias, Sunflowers, Golden Rod, Antirrhinums, Begonias, Delphiniums and Kniphofias are amongst the most successful subjects that can be cultivated in the metropolitan area, for these were shown very extensively and well. We congratulate both the *Daily Express* and the London Gardens Guild on the success of their efforts in stimulating a love of flowers amongst Londoners, and in their efforts towards making London a city of flower gardens.

Legacies by the late Mr. Geo. F. Moore.

The late Mr. Geo. Frederick Moore, of Chardwar, Bourton-on-the-Water, Gloucestershire, whose collection of Cypripediums was one of the finest in the country, bequeathed several legacies from an estate amounting to £230,936. He bequeathed £2,000 to the Bourton-on-the-Water Cottage Hospital, and another £1,000 to the Hospital from bequests left to his sisters and brothers, on the death of the survivor; £1,000 to the local Church Council; £1,000 to the Parish Council and Churchwardens, on trust, to apply the income in gifts of coal to the poor; and £500 to the Parish Council, upon trust, to apply the income for improvements in the parish, such as the upkeep and replacement of the trees planted by him. He directed that six months' wages should be paid to each of his outdoor men servants, and, among other bequests, gave an annuity of £20 each to three indoor servants, with the proviso that when they become unfit for work the annuity of two should be raised to £50 per annum and a cottage provided for their occupation, and he requested his sister to make provision for the other. We understand that during his life-time Mr. Moore made ample provision for his gardener, Mr. W. Page.

Charles Darwin's House at Downe.—Following the announcement by Sir Arthur Keith in his presidential address before the members of the

British Association at Leeds, that the Council of the British Association was considering the purchase of Charles Darwin's house at Farnborough, Kent, Dr. George Buxton Brown, F.R.C.S., has offered to make himself wholly responsible for the purchase. His motive is to allow future generations to see Darwin's home which, with its estate, might otherwise have passed into the hands of the builders. The cost, including the endowment fund, will amount to about £15,000, and Dr. Brown has made the condition that no other contributor is to be asked to share the cost with him. In recent years Downe House has been used as a school. It stands on about eighteen acres of land; the original square, brick building of three stories was extended by Darwin, who built a large bow extending up through the three stories, and also added a drawing room with a verandah opening into the garden, and a study.

Appointments for the Ensuing Week.—**MONDAY, SEPTEMBER 12:** National Chrysanthemum Society's Floral Committee meeting;

looking more like an Artichoke than a Dahlia. All the plants are vigorous, but there is not a single perfect flower-head upon any one of them, so that the sport seems to have become already fixed. One of the specimens is now before us. The bracts or scales of the involucre, and the paleae of the receptacle, instead of retaining their usual membranous state, have all taken on them the texture, colour, and veins of leaves, even narrowing their bases into foot-stalks. Not only is there no trace of flowers in the axils of their scales, but even rudimentary buds are deficient. The receptacle is elevated into a slender axis, and the end or centre of it is in no one respect different from the central scales of an ordinary leaf bud. In one of the examples the clustered arrangement of the involucral leaves is entirely gone, and its place is taken by a mere branch six inches long, covered over with small leaves, of which the uppermost are packed more closely and are smaller than the lower, whose stalks are full half-an-inch long, and are inserted in a tolerably regular spiral manner. This monster must be taken to

FIG. 93.—THE "GARDENERS' CHRONICLE" KIOSK AT SOUTHPORT SHOW.

British Mycological Society's autumn Foray and Annual Meeting at Aviemore (six days); Harrogate and District Horticultural Association's meeting; United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Association's meeting. **TUESDAY, SEPTEMBER 13:** Royal Horticultural Society's Committees meet (Vegetable show); Jersey Gardeners' Society's meeting. **WEDNESDAY, SEPTEMBER 14:** National Dahlia Society's show; North of England Horticultural Society's show (three days); Royal Caledonian Horticultural Society's show (two days); Guildford and District Rose Society's show; Sheffield Chrysanthemum Society's meeting. **FRIDAY, SEPTEMBER 16:** Manchester and North of England Orchid Society's meeting.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Green Dahlias.*—We have before us a singular example of that possibility of fixing a sport, to which allusion has been so often made. Mr. Salter, of the Versailles Nursery, Hammer-smith, observed last year among his seedling Dahlias one which produced a number of green, scaly, flower heads, but no perfect flowers. The root was propagated this season and every plant is now covered with similar heads of scales,

demonstrate, firstly, that the bracts and paleae of a Dahlia, and therefore of all composite flowers, are leaves imperfectly developed, or, if the reader pleases, stopped in their growth when young; secondly, that the receptacle of such plants, the "bottom" of the Artichoke, for example, is merely a branch taking a horizontal development, instead of growing longitudinally; and, thirdly, that no difficulty exists in perpetuating sports artificially. Mr. Salter and others should cultivate this strange production assiduously; it is by no means improbable that it may again sport or be made to do so, changing the green of its scales for some bright colour; and, if so, a very pretty looking garden plant would be the result. *Gard. Chron.*, September 11, 1852.

The Week's Work.

THE ORCHID HOUSES.

By J. T. BARKER, Dunstable, Bedfordshire.

Resting Dendrobiums.—In order to retain a vigorous and healthy constitution in the plants, rest is necessary, and everything appertaining to the drying and resting stages must be gradual, as not only the successful flowering but the ultimate health of the plant depends upon its thorough ripening and consolidation. It is generally easy to select positions for Dendrobiums where they may gradually pass from moderate shade to clear sunshine, taking care to choose a position where they are free from draughts and cold winds. When fully exposed to bright sunshine, the compost, being full of roots, will dry out quickly, therefore careful judgment is necessary in the application of water, as there is more skill in resting these plants satisfactorily than in cultivating them through their growing season. Plants well established in small receptacles will need water more often than larger specimens; but in either case, when once a thorough watering has been given, they should receive no more moisture until the whole compost has become dry again. The aim of the grower should be to give sufficient water to keep the roots in a healthy condition, to prevent undue shrivelling of the pseudo-bulbs, and to prevent new growth by the admission of fresh air, sunshine and cool conditions. The plants should be cleansed thoroughly, the new pseudo-bulbs neatly tied either to stakes or wires, and those of a pendent growth allowed to assume their natural habit. Aerial growths are best removed, and, if it is desired to increase the stock, may be put singly in small pots and placed in growing quarters, where they will soon become established. Cuttings that were inserted in sand earlier in the season, which have developed roots from the new growths, may be potted in the same manner as the aerial growths.

THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WAVERTREE, Horsley Hall, Gresford, N. Wales.

Red Cabbage.—If early heads of red Cabbage are desired the seeds should be sown now, and when they are large enough the seedlings should be planted in their final positions, or pricked out in a nursery bed and planted out in early spring. The soil between the plants should be kept stirred with the hoe.

Spring Cabbage.—Where plants of the earliest sowing are strong enough, they should be planted in their final positions, which should be somewhat sheltered. Small-growing varieties may be planted in rows fifteen inches apart, and about twelve inches asunder in the rows. Keep them dusted with a little old soot and stir the soil with the hoe on frequent occasions. When the plants are growing freely draw a little soil to the stems.

Brassicas.—Keep these plants free from weeds and yellow leaves, and use the Dutch hoe between the rows on frequent occasions. Mould up the stems before the plants get too large. Keep the curds of Cauliflowers well covered with their own leaves.

Celery and Leeks.—Constant attention should be given to these vegetables during the coming months, and more soil and paper added to the stems as required.

Runner and Dwarf Beans.—These useful legumes are cropping freely, and the pods should be picked so soon as they are ready or the plants will quickly fail to furnish a good supply. Feed the roots with liquid manure about once a week, and thin the foliage if it becomes at all crowded.

Asparagus.—See that the stems of Asparagus are supported either by strands of string or by strong twigs thrust around the plants. If the plants are at all weak, or if the weather is dry, give the beds a thorough soaking with liquid manure.

Cardoons.—See that a little more soil is added to these plants about every ten days; if hay-bands, straw or paper are used for the present, more of these should be added. Care should be taken that the soil does not get into the hearts of the plants, or rotting will occur and cause irreparable damage.

Potatos.—In view of the wet season, Potatos should be dug so soon as they are ready. I advise early lifting at all times, and it is more than necessary this season in view of the danger from late blight. Where possible, spray the crop again as advised in an earlier calendar.

PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

Lilium candidum.—Where it is intended to grow this Lily in pots, bulbs for the purpose are now obtainable. They should be potted directly they are received, for they will suffer somewhat if they are kept out of the ground for any considerable length of time. A suitable compost for this Lily is made of good open loam mixed with coarse sand and old mortar rubble to render the mixture porous. When potting, it should be borne in mind that this Lily is not stem-rooting, therefore it is not necessary to allow room in the pots for top-dressings. Stand the receptacles in a cold frame where the lights may be put on to ward off heavy rains, but make no attempt to force this plant into flower; it should be grown under the coolest conditions, otherwise it may be a complete failure.

Cinerarias.—Plants of the earliest batch of Cinerarias will now be growing freely in the receptacles in which they are to flower, while those that are to form a succession are ready to be transferred to small pots. These plants are best grown in cold frames with a layer of coal ash on the soil, and they should be exposed to the air until frost threatens, when the frames should be protected with mats or other suitable materials. Greenfly and the leaf-mining maggot are often troublesome to Cinerarias; these pests may be easily kept in check by spraying the plants occasionally with nicotine emulsion.

Salvia splendens.—This useful decorative plant is often planted out in borders during its growing season, and where this method of cultivation has been practised the plants should now be lifted and potted. Keep the roots well supplied with water, stand the plants in a shady spot and spray them on frequent occasions until they have become established again. Where the plants have been kept well pinched to ensure bushy specimens, stopping should be discontinued. When it is noticed that the plants are well established in the new soil they should be given copious supplies of liquid manure. Plants that have been grown in pots during the summer should also be fed liberally.

Chrysanthemums.—Early-flowering Chrysanthemums are, in most cases, planted out in borders, and where they have been grown under these conditions a few of the more forward plants should be lifted and placed in suitable sized pots for decorative purposes. They will be found very useful for decorating the conservatory and dwelling house. Lift the plants carefully with plenty of roots, in dull weather. The plants should then be stood in a shady corner for a few days and the roots kept well supplied with water. Occasional sprayings with rain-water overhead will help the plants considerably to recover from their disturbance. Other plants may be lifted and planted out in deep frames where protection may be given to the flowers from heavy rains. Choicer flowers for cutting will be obtained if the trusses are disbudded. Chrysanthemums that are being grown in pots

to produce large blooms, also single and decorative varieties, will require regular attention with regard to tying in all loose growths. Should green-fly or the leaf-mining maggot be in evidence, spray the plants with nicotine emulsion or Abol insecticide. Now that the receptacles are filled with roots plenty of water is necessary, also liquid stimulants. The grower should be guided in these matters by the state of the weather and the plants under cultivation. Before liquid manure is applied see that the soil is in a fairly moist condition.

HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

Preparations for Planting.—Although too early to plant fruit trees, the present is a suitable time in which to take notes of the different kinds best suited to particular purposes. A visit to a good fruit nursery at this season of the year is always interesting, when young trees of both new and old varieties may be seen growing in quantity and their merits compared. Intending planters on a large scale should not overlook the fact that orders are, as a rule, executed in rotation, therefore to avoid delay as much as possible, it is necessary to send the order early. If it is intended to plant many trees, timely preparations should be made, so that the planting may be done so soon as the trees arrive. In selecting ground for a new fruit plantation, choose land which slopes towards the north and, if possible, well sheltered from the north and east. The soil should be drained thoroughly and well tilled to a good depth, especially if the ground is on the flat and of a close, retentive texture. To make a selection from the large numbers of both Apple and Pears is bewildering to many. It is not advisable to plant too many sorts for the sake of variety, but only good quality, heavy cropping varieties, the fruits of which will furnish a succession over a long period; good late fruits are always in demand.

Morello Cherries.—The weather has been very unfavourable to these fruits which should be gathered in fine weather, before they are past their best. Morello Cherries, when bottled, are much appreciated in the winter, when fruits are scarce. The preserving of Morello Cherries and other fruits in bottles is not carried out so extensively as it should be when the fruits are very plentiful. So soon as the trees have been cleared of their crops, remove the nets that have been used as a protection against birds, and thoroughly wash the leaves and wood with an insecticide. Insecticides at a moderate strength should be applied a few times in succession in preference to giving one or two heavy applications. Petroleum emulsion, when used rightly, will do much to cleanse the foliage, making the leaves clean and bright.

FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

Early Vines.—Any root-pruning, root-lifting or additions intended to be done in early vineries should be attended to whenever the weather is favourable. Not one of these operations can be completed without the aid of good compost, which should be prepared in quantity equal to the probable demand. Ordinary soil at this season is by no means cold, but with the addition of a fair percentage of bone-meal the whole mass is soon warmed by the fermentation of the fertiliser. Root lifting should be done when the compost has become exhausted of its fertilising properties. Commence at the front of the border, working out the old compost with a steel fork, taking care not to injure any of the roots, as vines already weak are in need of every portion of old root worth retaining. The roots should be tied together carefully until the drainage is made efficient and ready for the reception of the new compost. New turves, grass side downwards, form a good base on which to place the soil. The latter

should be made firm by treading, and high enough to accommodate the roots in the lowest part of the undisturbed border. The roots should be spread out, examined and relieved of all faulty or injured parts with a sharp knife. A little soil should be placed over them and made firm, another layer of roots should follow, and so on, until planting is completed. The vines during this process should be kept fairly close, moist, and in some cases shaded, but when only one-third or one-half of the border is removed, vines having an abundance of roots in the undisturbed part seldom show signs of having been interfered with. Outside or inside borders may have a little fresh compost added from year to year as the roots require it, and the best time to apply it is immediately after the crop is cut and the main leaves show signs of ripening. A portion of the border along the front should be forked down, when the strongest roots may be shortened, and those descending into the drainage brought nearer to the surface. As vines always do best before the roots reach the extremity of the space allotted to them, eighteen to twenty-four inches of fresh border at a time is ample. The old part of the border being solid and firm, care is necessary to see that the new soil is in close juxtaposition to the old, otherwise the young roots will be strained, and watering will increase any cavity that may appear instead of penetrating evenly through the border.

THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

Amaryllis Belladonna.—At the time of writing, this bulbous plant is commencing to flower. Apart from its decorative value as a flowering plant, the blooms are ideal for use as cut flowers. The most suitable place in which to grow this *Amaryllis* is in a warm, well-drained border at the foot of a south wall; if it is the wall of a plant house, with water pipes inside, so much the better. The dry bulbs are usually received from the bulb merchant about this time, and they should be planted without delay in a well-drained, carefully prepared border, for if they do well they may remain undisturbed for many years. The tops of the bulbs should not be covered with more than three inches of soil; this is, I realise, quite contrary to the usual advice, which is to plant them at least eight inches deep. If, however, they are planted too deeply they usually fail to flower freely, the bulbs apparently not ripening properly. There are numbers of varieties, but they do not differ much, with the exception of an early flowering form, wrongly called *blanda*, and the fine, late flowering variety known as *rubra major*. There is also a fine variety known as the *Kew Belladonna*.

Nerine Bowdenii.—This beautiful species should be much more generally planted out-of-doors, for it succeeds perfectly under the same conditions as the *Amaryllis*, and, except in very favoured situations, is the only *Nerine* that succeeds out-of-doors. It should be treated in every respect like the *Amaryllis*; shallow planting is essential for this plant. This species is more or less evergreen, and ideal for supplying cut blooms. If frost should appear before the plant has finished flowering, it is an easy matter to afford it some slight protection.

Watsonias.—These South African plants have been very much neglected, and yet most of them succeed under the same conditions as the *Amaryllis* and *Nerine*. In the south, at least, the best known *Watsonia*, viz., *W. Meriana* var. *alba*, generally known as *W. Ardernei*, succeeds perfectly in the open, and is in flower at the time of writing, August 27. A large bed interplanted with a good variety of *Lobelia fulgens* is very beautiful. Dry corms of this *Watsonia* may usually be obtained early in the year; when such is the case they should be planted directly in their flowering quarters, in the same way as *Gladioli*. If, however, corms are received during the autumn, it is wise to plant them at once, as their growing season is during our winter. They are hardier than is generally believed, and should be more generally planted.

FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

Sweet Peas.—These beautiful annuals have done extremely well this year in spite of the somewhat unfavourable summer. In order to prolong their season of usefulness, all spent flowers and seed-pods should be removed; if the plants have reached their maximum height and are still growing freely, the side-shoots should be regulated by removing alternate ones and securing the remainder so that they are kept growing erectly in order to produce straight-stemmed flowers. Where a supply of Sweet Peas is desired early next season, either under glass or out-of-doors, seeds may be sown now in pots, and the seedlings kept in a cool house

for many purposes. Ample drainage is essential and this must be renewed whether the plants are to be repotted or simply top-dressed, as copious supplies of water and liquid manure are necessary to these plants in their growing season. Disease is prevalent in Arums in some places. At the first sign of disease the plants should be sprayed with potassium sulphide (liver of sulphur) at the rate of one ounce to one gallon of water and again occasionally after the disease has been controlled. Arums are hardier than is usually supposed, and although their foliage may droop for a few hours after a frosty night they soon recover, and, so far as I have observed, flower with greater freedom if grown without fire-heat. A number placed in about two feet of water have flowered extremely well out-of-doors here this summer

FIG. 94.—EUSTOMA RUSSELLIANUM.

(see p. 206).

during the winter. The seeds should be shaded from bright sunshine until they have germinated, but afterwards the plants should be exposed to light and air to keep them sturdy; only in times of frost is fire-heat necessary. By sowing five seeds in a four-inch pot and transferring the seedlings to larger sizes when required in the early spring, fine specimens may be grown for making a greenhouse gay early next year, or if they are shifted once into six-inch pots they will make splendid plants for setting out in April.

Richardia africana.—Arum Lilies are grown in many gardens under almost cool conditions, with the result that they are usually very late in ripening their foliage, but so soon as this has taken place, the plants should be examined and repotted if necessary. Fine specimens may be grown in ten-inch pots, and when they become exhausted, the clumps may be broken up and made into a smaller batch, which will be useful

and will be wintered in that position to prove their hardiness.

Potatos.—Second-early Potatos should now be lifted and stored, as the foliage is quite ripe, at least in early districts. Where home-saved sets are to be used next spring the same care should be taken in securing them as was advised for the earlier sorts. It is not sufficient to dig the whole plot and then pick up any tubers of seed size; only sets of seed size from well-cropped plants should be retained. The seed tubers should be stored in trays, in a well-lighted shed, where they may be looked over occasionally on wet days. The ware tubers should be stored in dark sheds or cellars and kept covered by straw so that no light may reach them. Where Potato disease is prevalent, the tubers will require to be looked over from time to time, removing any showing the well-known discoloration which indicates the presence of disease.

ALPINE GARDEN.

SPIRAEA DECUMBENS.

ONE of the dwarfiest of the woody Spiraeas, *S. decumbens*, is a very attractive little shrub, and one that might be more often seen in our rock gardens. A native of the Tyrolean Alps, it is perfectly hardy and easy, delighting in a rocky root-run with full exposure, and it is by no means averse to wall culture. This is a deciduous species, making a little thicket of thin wiry branches some eight inches in height, which are amply furnished in summer with oval, toothed leaves of a pale bluish-green. These growths terminate in flat heads of white flowers of which a succession is maintained almost throughout the season.

There are several cultivated forms of *Spiraea decumbens* (*procumbens*), one of which is *S. Hacquetii* (*S. d. var. tomentosa*). This has rather narrower leaves which, with the younger wood, are more downy than those of the type. In any of its varieties *S. decumbens* is a delightful shrub, and though it is inclined to "run," it does so very slowly, and has never, in my experience, become a nuisance.

SPIRAEA CAESPITOSA.

THIS is a pleasant little plant for a really well-drained, sunny ledge in the rock garden. It is an American species and makes a low, neat mat of grey-green, undivided leaves. Throughout the later summer it puts up a number of three-inch flower-stems each terminating in a spike of fluffy, pinky-white blossoms. *S. caespitosa* is quite hardy with me, and it does very well in a dry moraine of ordinary scree mixture. Being a later bloomer, it is especially welcome, and, not being a showy plant, it has the advantage at this season of having the field to itself—comparatively, at any rate.

NERTERA DEPRESSA.

FOR some years this New Zealand plant did not succeed very satisfactorily in the open with partial shade from a rock, and with the shelter of a bush it did not seem much happier. An opportunity then occurred of providing it with a large cavity beneath a shelving boulder, this facing north and the ground below being rather cool. *N. depressa* was accommodated with this position and a bed of leaf-mould and sandy loam, and it has never looked back. It is now spreading like *Helixine Soleirolii*, and bearing a fair crop of its attractive, scarlet-terra-cotta fruits. The overhanging rock of course, gives it protection from both scorching sun and winter frosts. *A. T. J.*

DIANTHUS GLACIALIS VAR. FREYNII.

EXQUISITE, indeed, in the rock garden, on a flattish terrace, is *Dianthus glacialis* var. *Freyii*, allied closely to *D. microlepis*, but differing mainly in having blue-grey and not green leaves. It is one of the tiny alpine gems so dear to the heart of the alpinist, and one which he never ceases to admire when in bloom. Nor, indeed, does his admiration wane when it passes out of flower, for the close tuft of tiny, blue-grey leaves rises but little above the soil and is so neat and compact that it is a picture in itself. Yet it is with keenest delight that we see it in flower, its small, pink flowers spread open wide and hardly rising above the exquisite little tuft which has given them birth.

D. Freyii—to use the name this plant most commonly bears—does not appear too fastidious in its diet, but it likes to be mulched with fine gravel and is never happier than in a moraine. It is worth while quoting Farrer's remarks on *D. Freyii* and *G. microlepis* as justifying my words of praise. He writes of these two that they "may be said botanically to come near *D. glacialis*; in every detail they are as far removed from it as possible in the gardener's eye—incomparably more exquisite, permanent, neat, minute and delightful." Can praise go higher? *S. Arnott.*

FLOWER GARDEN.

EUSTOMA RUSSELLIANUM AS A BEDDING PLANT.

THE beautiful *Eustoma Russellianum* (Fig. 94) is usually regarded as a greenhouse plant, and a difficult one at that, thus it will surprise many who may have attempted to grow it to find a bed of close on one thousand plants making a fine display in Hyde Park. Mr. T. Hay, the Superintendent, is always keen to try a new or neglected old plant for a display in the open, and the fact that a plant is difficult does not in any way deter him from trying to master its cultivation for his particular purpose. He has done much to make the parks under his charge more interesting and attractive, and not only to the general public, but also to the lover of choice and uncommon plants.

Associated with the *Eustoma* is *Sabbatia campestris*, another beautiful plant which, I believe, has not been generally in cultivation for many years. It produces its rose-coloured flowers very freely. They both belong to the same natural order, viz., *Gentianaceae*, and this gives an added interest to this unique bed. Both plants are best treated as biennials; the *Eustoma* should be sown about the middle of May, and the seedlings grown on in a cool house or cold frame. *J. C.*

SPARAXIS PULCHERRIMA.

I WOULD offer a word of praise for the Wand Flower which has been flowering in my border for the past three weeks and looks as though it will continue to bloom for some time.

The species is well-named, for the grass-like leaves, surmounted by graceful flower stems, look like a fairy's wand. The individual flowers resemble those of a *Freesia* in shape, and their colour is a very pleasing rosy-purple.

There are few more attractive border flowers, and those who desire to plant it during the coming autumn may be informed that it will succeed in the average herbaceous border.

As this species attains the height of five feet, it should be planted amongst tall-growing subjects, and transplanting should only be done when there are definite signs of deterioration of vigour, for it is very impatient of root disturbance. *Geo. H. Copley, N. D. H.*

SCROPHULARIA AQUATICA VARIEGATA.

THE above plant does not appear to have been recorded under its correct name for more than half-a-century. It does not appear amongst the new plants recorded in the *Bulletin of Miscellaneous Information* issued from Kew since 1876; but the plant is older than that and enjoyed a considerable vogue during the time that carpet bedding was popular, and all sorts of coloured and variegated plants were in request for carrying out parti-coloured designs. In those days it was pinched frequently to keep it dwarf, though it might have been allowed to grow to its natural height without the flowers, and its use thus extended as a dot plant, for the variegation (a creamy yellow at first) is quite conspicuous and effective. The name the plant bore in those days and even now is *S. nodosa variegata*, often wrongly spelt, possibly through the custom of transcribing the name from old and decayed labels to new ones.

S. nodosa has acute or acuminate leaves and a knotty, tuberous root. *S. aquatica* has leaves that are often twice as long as those of the other and they are blunt, while the root-stock is not tuberous. The two species may easily be distinguished by the above characters, though they have several other marks of distinction. *J. F.*

OENOTHERA BERTERIANA.

THIS attractive plant, raised from seed recently collected by Mr. H. Coomber, was introduced from Chile many years ago, but was apparently soon lost to cultivation as it is never referred to in any of the standard works. It is flowering freely in the open border at the present time, but as these plants were not put out until

late spring it is difficult to say whether they will be hardy or perennial. However, an abundance of seed is setting, which should ensure its continued existence, as the seed from Chili germinated freely.

This *Oenothera* is a loose-growing plant, producing strong, spreading growths three feet or so in length, arising from a woody root-stock. They are sometimes branched near the summit, coloured light green, tinted with red, sometimes turning to light brown, and hairy.

The leaves are sessile and vary considerably in length; those near the bases of the plant are in some instances twelve inches long, while those higher up the stem are much shorter. They are narrowly lanceolate in shape, tapering to a slender apex, both surfaces being rich glossy green and sometimes slightly hairy, the broad, whitish midrib being prominent, and the margins distinctly and irregularly dentated.

The long-tubed flowers are produced singly from the axils of the leaves. They are large and of striking appearance, being three inches or four inches in diameter, and of a rich yellow colour, fading to a salmon shade. The petals are broadly ovate and notched at the top, the centre being ridged and the margins slightly wrinkled, while the four reflexed sepals are light green, tinted with red, hairy, and narrowly lanceolate in shape, the apices being furnished with short, blunt prongs.

Oenothera Berteriana should prove a useful addition to the garden, being free both in growth and the production of its blooms. *A. G. F.*

TREES AND SHRUBS.

THE JACARANDAS OF PRETORIA.

PRETORIA, the capital of the Transvaal, is proud of its fine streets, planted with *Jacarandas*. The species planted are *J. ovalifolia* and *J. mimosaefolia*, and between these two there is little difference.

Jacarandas are natives of Brazil, and in most sub-tropical countries are used as trees for streets and gardens. They grow to a height of thirty feet to fifty feet, are deciduous, have long, spreading branches, and although very often cut back by frost, they rapidly recover their beauty.

During the months of October, November and December the streets of Pretoria are a wonderful sight, when the *Jacarandas* carry masses of blue flowers and are clothed with their beautiful, Fern-like leaves. June and July are our winter months in Pretoria, and the trees are mostly pruned in August.

Walton Jamieson, Esq., when Town Engineer, for the Pretoria municipality (he is now Town Engineer at Kimberley, Orange Free State), was the first to plant *Jacarandas* as street trees in Pretoria, where he became known by the name of "Jacaranda Jim." Each year the municipality of Pretoria plants about 2,000 to 3,000 *Jacarandas*, the young trees being grown in Princess Park nurseries at Pretoria-west. Seeds are collected during the winter months and sown about the middle of August, in a well-prepared bed in the open ground, but before being sown they are soaked over night in water. A good covering of sandy soil is given and the beds are well-watered, but owing to the terrific rainstorms experienced, they are well covered at night.

The seeds soon germinate, and when the seedlings are about four inches to five inches high, they are placed in tins, not in pots (English gardeners may smile at this), but all jam tins, syrup tins, or any other sorts of tins are used for transplanting trees, shrubs, Roses, Carnations and bedding plants. Pots are only used for conservatory plants in Pretoria, for if they were used outside the soil would dry out too quickly, and the plants suffer severely.

When the young *Jacarandas* are "tinned off" in lb. tins, they are usually placed in a shady position or covered over with straw mats, as they suffer a little during the first week.

The seedlings are kept in the tins for twelve months and the next year are transferred to

tins of a larger size, usually oatmeal tins. They are often placed near a hedge for protection from frost, until the trees are about five feet to six feet in height, and ready for the streets. During the first year after planting they require to be watered occasionally, but after that watering ceases as Jacarandas are deep rooting trees. During the first two years the young trees have their stems covered as a protection from frost, but after five or six years the Jacarandas commence to bloom [and afterwards flower annually.

Seeds are produced very freely, and many thousands are distributed annually by the Pretoria Municipality.

Other trees used for street planting in Pretoria include *Platanus occidentalis*, *P. orientalis*, *Schinus Molle*, *Pinus sylvestris*, *P. canariensis*, *Ligustrum japonicum*, species of *Quercus* and various Palms—*Phoenix canariensis* in particular. *H. Bruins-Lich*.

AILANTHUS ALTISSIMA.

THE Tree of Heaven, *Ailanthus altissima*, or, as more commonly known in gardens, *A. glandulosa*, was first grown in Europe in 1751, from seed sent from Pekin, and the first *Ailanthus* was planted in the United States by William Hamilton. When, at a later date, it was found that one of the silkworms would feed on its leaves, the *Ailanthus* was widely and successfully planted in France.

As a street tree it was used extensively in Paris during the early years of the second Empire. The strong and offensive odour of the flowers soon convinced the citizens of Paris, and also of American towns where the *Ailanthus* had been planted in large numbers, that, in despite of its vigorous growth and the luxuriance of its long, gracefully-drooping habit, as a street tree, the *Ailanthus* will not do. Its brief spell of popularity was followed by one of persecution, and large numbers of trees recently planted so largely were cut down. Nevertheless, except for the disagreeable odour of its flowers, the Tree of Heaven is an ideal street tree for large thoroughfares. Its growth is rapid, it withstands drought and heat, and is unharmed by the gas escaping from leaky gas-pipes—so frequently a source of injury to street trees. Insects avoid it and it is propagated very easily from root-cuttings. It is curious, therefore, that before the rage for destruction overtook the Parisian and American dwellers in cities they had not discovered that the tree is almost completely dioecious, that is, individual trees are either male or female, and that the malodorous habit is confined to the male flowers, the female flowers being scentless. Occasionally, male flowers are found in the clusters of female flowers, but they are not in sufficient numbers to cause offence. The female tree, which is evidently the one to plant, is, moreover, more ornamental than the male by reason of its great terminal clusters of winged fruits, yellow in the type, but bright red in the variety *erythrocarpa*. The variety has also another advantage over the type in that the upper surfaces of the leaves are darker green and the lower lighter.

Another use to which the Tree of Heaven has been put is that of dune fixing, and it was planted in sterile, shifting sands on the shores of the Black Sea, and proved an admirable stabilizer of the dune.

Lastly, the wood of *Ailanthus altissima* is of considerable value to the cabinet-maker, seasoning easily, warping but little, and taking on a clear yellow colour not unlike that of satin wood.

Having regard to the fact that it flourishes on sandy coasts, it would be well worth the while of some of our seaside towns to plant *Ailanthus* for shade and shelter.

Although the *Ailanthus* is a native of China, it is said that the tree has hitherto hidden its native place successfully from the prying eyes of European travellers in the Celestial Empire, and that no explorer has as yet seen it in the wild state.

Two other species of Western China are, however, known, *A. Giraldui* and *A. Vilmoriniana*, the former characterised by prickly branches, the latter by downy branchlets. *K.*

NUTTALLIA CERASIFORMIS.

A NATIVE of north California, this March-flowering shrub is perfectly hardy in this country. Although its flowers have no bright colours to recommend them, the species is undoubtedly worthy of a place in the garden by reason of its early season of blooming and the profusion with which the flowers are borne. From a short distance, one might mistake the plant for a greenish-flowered *Ribes*, which it resembles in habit of growth.

The flowers are borne in pendent racemes

ORCHID NOTES AND GLEANINGS.

VANDA COERULEA.

THIS lovely *Vanda*, first discovered by William Griffith in 1837, on the Khasia Hills, has always been a favourite plant with Orchid lovers. When seen at its best it is a delightful species but to cultivate and flower it successfully requires a somewhat special treatment, although individual plants are occasionally

FIG. 95.—LAELIO-CATTLEYA CANBERRA.

R.H.S. Award of Merit, August 27. Flowers golden-orange, ruby and rose. Shown by Messrs. Cowan, Southgate. (see p. 199).

from one-and-a-half-inch to two inches long; each has five small, white petals and a green, five-lobed, bell-shaped calyx. They spring from the axils of conspicuous bracts and are almond-scented.

As a rule, the male and female flowers are produced on different plants, but a hermaphrodite form is known. From a decorative point of view, the male plant is the better, but it is worth while including a few specimens of the female when planting to obtain a show of the abundantly produced, purple, small, Plum-like fruits.

A well-drained, loamy soil suits the *Nuttallia* admirably. Cuttings root readily and the plant may also be increased by means of seed. *T. H. Everett.*

found in a thriving condition under unorthodox methods of culture.

Vanda coerulea is found growing on small, gnarled and very sparsely-leaved trees at an elevation of 3,000 to 4,000 feet, so that it is fully exposed to sun, rain and wind. There is very little moss or lichen on the branches of these trees, and the roots of the Orchids ramble over the rough bark. The atmosphere is, on the whole, humid, and extremely so during the rainy period, but not excessively damp or hot during the flowering season, when the temperature ranges between 60° and 80°; there is much sunshine, and both the air and the bark are dry during the day. In July and August, during the rains, the temperature is a little higher, but in winter much lower.

As a proof of the high estimation in which this Orchid has been and is still held by amateurs, I need only point to the numbers of plants imported annually, and the unusual number of coloured illustrations of it which have appeared in horticultural periodicals.

Little can be added to the description given of the conditions under which *V. coerulea* grows in its native habitat, but the climate data afford only a slender clue to the cultural treatment necessary in our glasshouses, as the extensive range of temperature and the excessive downpour of rain during the growing season are conditions we cannot imitate.

During its period of active growth, *V. coerulea* requires the lightest position in the East Indian house, with frequent sprayings on all favourable occasions, a liberal supply of fresh air at all times, and a humid atmosphere. It may be grown in pans, baskets or pots, in a compost of *Osmunda* fibre and live *Sphagnum*-moss, and care must be taken that the compost is not allowed to decay and become sour.

So soon as the flowers are ready to expand, the plants should be removed to a cooler and drier house, with a temperature of 55° to 60°, while an abundant supply of fresh air should be admitted whenever the outside conditions are favourable. It is seldom that any two plants of this beautiful species have flowers exactly alike. Almost every shade of colour is seen, from a soft, bluish-tinted white to a deep blue; there is also considerable diversity in the size of the flowers, but the varieties most sought after are those with blooms of a rich coerulean blue, of rounded form and large size.

Some remarkably fine varieties of this delightful species have been shown in the past, some of them coming from the Shan States, a habitat which has proved to be rich in remarkable forms. Nine First Class Certificates have been awarded to fine varieties, and three Awards of Merit. I believe there is but one hybrid in which *V. coerulea* figures as a parent, and that is *Vanda amoena*, first shown on September 21, 1897. *Vanda amoena* Sanderæ, a variety of this hybrid, was shown on August 4, 1908, *V. amoena* is the result of crossing *V. coerulea* with *V. Roxburghii*. J. T. B.

INDOOR PLANTS.

DATURA SUAVEOLENS.

As an evergreen flowering shrub for cool greenhouse cultivation, *Datura suaveolens* is a subject worthy of notice. It was introduced from Mexico in 1733, and is sometimes known as *Brugmansia*.

The large, white, trumpet-shaped flowers are produced in August and are deliciously fragrant. The leaves are elliptic-oblong in shape with entire margins, glabrous above and slightly downy beneath. Under favourable conditions the plant will grow to a height of ten feet or more.

If necessary it should be potted early in the spring, just as the growth commences, using a compost of light, fibrous loam, with a third part of old manure and leaf-mould, and a sprinkling of sand. The pots should be well drained, otherwise the copious waterings which should be given when the plant is in full growth will result in the soil becoming waterlogged, a condition which will first cause the yellowing and dropping of the leaves, and ultimately the death of the plant.

The growth made during the early part of the summer should be well ripened towards autumn by free exposure to sun and air. To this end the plants may be stood out-of-doors in a sheltered, sunny spot in autumn, but they must be taken into a cool, airy house before frosts occur, and should be kept on the dry side during winter.

Cuttings six inches long, pulled from the plant, with a heel, in spring, and inserted in sandy soil with a bottom-heat of 60° will root readily. R. K.

THUNBERGIA GIBSONII.

The vivid orange colouring of the flowers of this climbing or trailing plant is scarcely sur-

passed in depth or intensity by any other flower, and for this reason alone the plant should find a place, when it is obtainable, in every collection of indoor plants.

It is of moderate growth and thrives in an ordinary greenhouse; it enjoys plenty of sunshine and will grow well in soil consisting of loam, leaf-mould and sand. The brilliant flowers are freely produced in summer from the axils of the leaves. Seeds, which the plant produces freely, offer a ready means of increase.

I know little of the history of this very showy plant, but believe it to be a native of South Africa; it is of perennial duration.

TACSONIAS.

THESE elegant climbing subjects are suitable for cultivation in large conservatories and greenhouses as wall, roof or pillar plants, and the pendent flowers are particularly effective when they hang from plants trained under the roof. The majority of popular species grow freely and are not fastidious regarding soil, provided the drainage is thorough and copious supplies of water are given during the growing season. When planted in borders—and this is by far the best method of growing Tacsonias—the roots should be partially restricted, otherwise over-luxuriant growth may be made at the expense of floriferousness. An annual thinning of the shoots and cutting back of main stems are requisite for established plants.

A mixture of three parts loam, one part peat and some sharp sand is an admirable rooting medium, and it is a wise proceeding to exercise considerable restraint in the use of manure and stimulants.

Tacsonia insignis, with crimson flowers; *T. mollissima*, soft pink; *T. Van-Volxemii*, scarlet; and *T. mixta*, pink; are well-known and very beautiful species.

Propagation is readily effected by means of cuttings of young shoots removed in spring, with a "heel" attached, and inserted in a close propagating case. Seeds also afford a ready means of increase—I have, indeed, found many self-sown seedlings around an old plant of *T. Van-Volxemii*.

The chief characteristics of the genus are the long, cylindrical tube of the calyx, furnished with two crowns, one at the throat and the other near the base; petals five, usually smaller than the calyx lobes; corona entire or filamentose; stamens five; leaves alternate; tendrils lateral, undivided. The main difference between *Passiflora* and *Tacsonia* is the long, cylindrical tube with the two crowns.

EUPHARIS.

WHERE a sufficiently high temperature can be maintained, few plants are more worthy of cultivation than the old favourite *E. grandiflora* (syn. *amazonica*).

Good examples may be grown and flowered satisfactorily in pots of moderate dimensions, but possibly the best results are obtained when the bulbs are planted in a bed or a brick pit in a stove or other warm house; the plants thrive in rich, turfy loam with the addition of plenty of sand, and are greatly benefited, when well established, by frequent and copious applications of liquid manure. Generous shade is requisite during the summer months and during the early autumn a partial rest is conducive to free-flowering, always remembering that water must not be entirely withheld; at this period a slightly lower temperature may be allowed. It is well to realise that restriction of the roots is not necessary or advisable as it is with so many other bulbous plants; indeed, such restriction will only starve the bulbs and prevent natural increase; therefore ample root-room should be provided, and growth encouraged.

Propagation is easily effected by means of offsets, but too frequent separation and disturbance is inimical to success; an occasional surface dressing of fresh, rich soil is much to be preferred until division and replanting are necessary.

Eucharis grandiflora possesses no well-defined season of flowering; with suitable treatment

established plants will flower two or three times a year, and after each crop of blooms it is an excellent plan to rest the plants partially for a short period.

It is very necessary to keep the plants clean and this is not a difficult matter, although the species is subject to attacks of aphides, scale and mealy bug.

E. grandiflora (syn. *amazonica*) was introduced from New Grenada in 1854, and is figured in *Bot. Mag.*, t. 4971. *E. candida* differs little from the better-known species; the flowers are smaller and more elegant, and the leaves solitary to each bulb, whereas they are several to a bulb of *E. grandiflora*. *E. Sanderiana* possesses the habit and foliage of *E. grandiflora*; but has a yellow interior to the tube of its otherwise pure white flowers. *Ralph E. Arnold*.

THE INCIDENCE OF INSECT ATTACK.

FROM an economic point of view, a study of some of the factors which underlie the epidemic appearance of any given insect is a matter of some importance. Each year insect pests take toll of our crops; in some years the toll is greater than others, not because the individual insects eat more in some years than others, but because they are present in greater numbers. Why is it that certain insects are present in large numbers one year and can hardly be found in the same district the following year? Why is it that an insect like the Gooseberry Sawfly (*Nematus ribesii*, Curtis) should in the present season cause great damage in certain districts of Britain, while in other districts it is only possible to find a specimen here and there?

If the Gooseberry Sawfly had a limited distribution one could understand the problem, but its distribution is widespread and in most seasons its damage is widespread also, yet in 1927 the damage reported is patchy. Again, why is it that certain insects flourish only upon unhealthy trees? If we could answer some of these questions we should be in a better position to fight insect attacks.

Generally speaking, all insects are kept within certain definite limits by what we term "the balance of Nature." We are apt to talk a good deal about this mysterious condition, but if we are honest with ourselves we must admit that we know very little about the factors which makes this balance hold true. We take for granted this "balance of Nature"; it is only when some of the factors favour the insect rather than the balance that our attention is drawn to the epidemic attack which is the result.

It appears to me that the greatest factor in the life of most insects is weather conditions. Take the example of a common garden pest, the Onion Fly (*Hylemyia antiqua*, Meigen). I think we may assume this pest takes very little notice of weather conditions while in the egg, larval and pupal stages; low temperatures during any of these stages do no more than to delay the stage in which the low temperature occurs. Wet weather during any of the three stages mentioned above has little or no influence on the life history of the individual concerned. It is during the perfect stage that weather conditions play their part for good or ill. Fine weather allows the adult Onion flies to feed, pair, and deposit their eggs upon a suitable host plant. Wet weather prevents the adult flies from feeding, they shelter in any convenient spot and often die before any chance of reaching an Onion bed and depositing fertile eggs occurs. I have noticed that Onion flies which emerge under artificial conditions, if unfed, die after a very short period, but if fed with sugar remain alive for many days. It is not safe to assume that what happens under artificial conditions actually happens in nature, but this fact of unfed Onion Flies dying after a few hours does tempt one to think that unless those Onion Flies which emerge from the soil under natural conditions can find flowers from which they can obtain nectar, they are apt to die from sheer starvation. I have never yet seen flies of any sort feeding upon flowers

during rain, and my observations point also to the conclusion that most flies hate windy weather, and are extremely inactive when the temperature is low.

It is not always that the factor of weather plays its part solely in the perfect insect stage. I have noticed that in the case of Lepidopterous insects it is often the larval stage that suffers from bad weather conditions, e.g., in the case of the Cabbage Moth (*Mamestra brassicae*); bad flying conditions must prevent the females from distributing their numerous eggs over such a wide area as would be the case under good flying conditions; this would not be such a great handicap as it would be to certain other insects' larvae, because when a Cabbage Moth larva emerges from the egg it is extremely active and can crawl a long way in search of food; under artificial conditions the baby larvae of this moth will live for seven or eight days without food, and will crawl many yards in

of rain and low temperature upon insect life, but there is another matter: indirectly, fine weather may reduce insect pests. I remember an autumn a few years ago, when in my district there was a bad attack of Large Cabbage White Butterfly; hardly a leaf of any Brassica remained whole, while many were reduced to skeletons. Eventually, when the caterpillars were fully fed, they could be found in hundreds upon the walls, fences and hedges, seeking suitable places to pupate. It looked certain that in the following spring large numbers of this pest would be on the wing, and yet the following spring was noticeable for the few specimens seen. The explanation of this was that a large percentage of the larvae had been attacked by the parasitic Braconid (*Apanteles glomeratus*). Instead of the Cabbage White larvae turning into chrysalis the parasites emerged from the larvae and spun up their tiny yellow cocoons while their hosts died.

PUBLIC PARKS AND GARDENS.

MR. K. G. R. VAIZEY has offered to the Urban District Council of Halstead, Essex, twenty acres of land for conversion into a playing field.

ASHTON-UNDER-LYNE Town Council proposes to borrow £3,740 for the purchase of land near Stockport Road for the provision of a recreation ground.

BANGOR (Carnarvonshire) Corporation has agreed to purchase the Old Camp field for a pleasure ground.

THE Worcester City Playgrounds and Open Spaces Society, in conjunction with the National Playing Fields Association, contemplates a scheme for laying-out the Worcester race course as a public playing field. The lay-out provides for eleven cricket pitches, twelve tennis courts,

FIG. 96.—THE NEW ROSE GARDEN AT HESKETH PARK, SOUTHPORT.

[Photo by Kay and Foley.]

search of food. Indifferent weather conditions plays a part later in the life history of the Cabbage Moth. If one is feeding a batch of caterpillars of this moth and using dry Cabbage leaves for the purpose, let him use wet Cabbage leaves, and he will find that half his caterpillars have died before they are a day older. Again, let us not assume that what happens under artificial conditions actually happens in nature. Evidence as to what does happen under natural conditions can be obtained by examining an infested Cabbage after a break in the weather following a long dry spell. One or more of the following four kinds of caterpillars are likely to be found within: the Large Cabbage White (*Pieris brassicae*, L.); the Small Cabbage White (*P. rapae*, L.); the Cabbage Moth (*Mamestra brassicae*); and the Garden Pebble (*Pionaea forficaria*, L.). I have found all four caterpillars dead under the conditions mentioned. The data given is, perhaps, sufficient to justify the conclusion that a sudden rush of sap and wet foliage will kill many caterpillars, apparently by scouring them.

So far, I have only been considering the effect

An examination of the specimens that changed into the pupae state showed that all was not well; quite a number of them, instead of containing an embryo butterfly contained the maggots of the parasite Chalcid (*Pteromalus puparum*, L.). It seems that the conditions which favoured the large number of Cabbage White butterflies also favoured their parasites, so that the net result of the fine weather conditions was a ruined Cabbage crop in the autumn and very few Large Cabbage Whites the following spring.

Another factor which favours some insects is undoubtedly an unhealthy host, e.g., Apple Mussel Scale (*Mytilaspis pomorum*, Bouché) often becomes rampant on trees that have been badly worked, bitten by rabbits, or are growing under some unsuitable soil condition. Some may consider that the unhealthy host is the natural result of having to support a large colony of scale insects, but I am certain that Mussel Scale does make most headway upon trees that are not in a flourishing condition. *Somerset.*

six hockey grounds, six football pitches, a running track, a netball pitch, a children's playground, and a pavilion.

THE new Rose Garden in Hesketh Park, Southport (Fig. 96) was constructed during the winter of 1926-7. It is 280 feet in length by 92 feet in width, and contains upwards of 4,500 Roses in twenty-seven distinct varieties, representing many well-known kinds, such as Betty Uprichard, Covent Garden, Dorothy Page Roberts, Emma Wright, General McArthur, Hortulanus Budde, Lady Inchiquin, Mabel Morse, Mrs. Henry Morse, Shot Silk, Souvenir de Claudius Pernet, and W. C. Gaunt.

The attractiveness of this Rose garden during the present season is ample evidence of the thoroughly sound manner in which Mr. Clark, the Superintendent of the Southport Park, laid the foundations of success. There is another delightful Rose Garden in this beautiful park, quite secluded, below the general level, surrounded by herbaceous borders and bounded by a high hedge.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA*

XV.—SOME PRIMULAS.

THE toll of Primulas from the Irrawaddy-Brahmaputra divide, though not so interesting as the Tsangpo collection, comprised at least six new species, and several which, though not new, are not in cultivation. Some interesting extensions in the distribution of known species were also observed.

One of the most charming alpine Primulas is the violet *P. Wattii*. The large, bell-shaped, frilled corollas are tightly compressed into a short, blunt cone at the end of a six-inch stem, which rises from a flattened rosette of toothed and very downy leaves. The plant was both rare and local, being confined to one alpine gully; half-a-dozen flowering specimens were found on June 30, and in October I made three trips after seeds, which, however, resulted in no more than some three dozen heads. The original home of *P. Wattii* is Sikkim. Here it grew on a precipitous, south-facing, alpine meadow slope, thickly covered with flowers, including *P. serratifolia*, dwarf Iris, *Nomocharis* sp., *Pedicularis*, spp., etc., at an altitude of 13,000 to 14,000 feet. At no great height above this plant life practically ceased amidst a wilderness of rocks and snow-beds; yet on the apparently bare cliffs my sight was arrested by one of the daintiest picaninny Primulas imaginable, strung along the joints. This was a twin sister of 'Claret Cup,' dressed in lavender and crimson, a wee, nodding fairy, with one or two, rarely three, flowers on the thread-like stem. The plant was not rare, but it was so minute, not exceeding an inch in stature, that it was hard to see in fruit, and, though I gathered several hundred heads, there was not very much of the pale golden seed to show for it. 'Blue Microbe' gets specific rank as *Primula fea*, W. W. Sm.

Lower down on the same escarpment was *P. rhodochroa*, which has one or two rosy-red and yellow flowers nestling down in a rosette of toothed and very mealy leaves. It would be almost invisible to anyone whose eyes were

not trained to see Primulas, so closely does it press itself into the lichen or grass-covered rocks. On the turf, too, was *P. Genestieriana*, another dwarf, only tolerated for the sake of its rich relations. I realised that there would be great difficulty in getting seeds of these mites, scattered over the bare immensity of Olympus, and decided to start a rock garden of my own. I therefore removed a consignment of 'Claret Cup,' 'Blue Microbe,' '*P. rhodochroa*' and *P. moschata* to my base camp—the fear of exterminating these rare plants seemed remote—and planted them on a rock, alongside a blazing slab of *Rhododendron repens*, planted at the same time to decoy insects. All the Primulas set good seeds.

Most of the July-flowering plants were high alpenes, but a few shrubs may be mentioned. *Rhododendron* 'Cherry Brandy,' finest of the Thomsonii group, was in full bloom, and there was a yellow 'Campylogynum,' and *R. saluenense*, which flaunts large, dusky-purple flowers, much more gaudy than those of *R. calostrotum*, or *R. rivulare*, armoured on the reverse with bands of silver scales.

FIG. 97.—THE DIPHUK LA (14,300 FT.) AND THE SECOND LAKE, FROM THE TIBET OR WESTERN SIDE.

But the most intriguing *Rhododendron* was one of the big-leaved 'repens' type. I had found a plant of this at the end of June at the foot of a granite cliff, with one lingering flower of a pinkish tint, but probably faded. The leaf, the mound-like growth, and the triple-flowered truss at once recalled the famous 'Carmelita' of Doshong La days. Prolonged search failed to reveal another plant, and there were only two capsules on this one. However, I did not despair. It is a sound rule if you find a solitary plant in a valley, and cannot tell where to find more, to leave it alone, and then go home, and—noting the type of ground—carefully climb straight up the mountain side, a thousand, two thousand, even three thousand feet, if necessary, and start casting round for the same type of cover; if you do not find more of your plant sooner or later, you will be unlucky. The fact is, the seeds of alpine plants are brought down by water or riding on boulders, or avalanches, or perhaps even by birds, and odd plants appear as outliers. I found the home of *P. Wattii* by following this plan. 'Claret Cup' first showed itself in the valley, three plants only, and a few days later I found sheets of it.

But the cliff at whose foot this particular *Rhododendron* grew barred the way to a steep alpine glen, which was almost certainly its

home. How to reach that glen was the problem. The cliff was precipitous, but there was a way if the shrubs which clothed most of the face would bear my weight. But at this season the glen was still packed with snow, and such a deluge of water was pouring over the face that I dare not hazard the climb. 'Safety first,' I thought, and postponed the ordeal to a more propitious occasion. When, at last, October brought a little sunshine, I started one fine morning to climb the cliff, and when I reached the top, I found myself in a tilted, granite glen, whose slab walls were carpeted with dwarf *Rhododendrons* and dipped steeply towards the escarpment overlooking the main valley. The bed of the stream was broken by bare cliffs, and nuzzling against these cliffs I found two large plants of the wanted *Rhododendron* whose hard, interlacing stems were all crossed and bent together in a foot-deep puzzle. They had flowered freely. This plant was not, I think, 'Carmelita,' but it was of similar deportment. In its extreme rarity, its size, its foliage, and its habit, to say nothing of its three-pronged fruit truss, it was in such acute

contrast to the creeping *R. repens*, which encrusted the turf slopes below the escarpment, that I find some difficulty in reconciling these facts with the view expressed by Edinburgh, namely, that 'Carmelita' is only a variety of 'Scarlet Runner.' However, in stressing their differences, I can only write as a field botanist, and I do not propose to dispute the judgment of Mr. Tagg, who has seen many more *Rhododendrons* than I have; but for garden purposes the two plants are certainly highly dissimilar.

On July 6 we moved camp two miles up the valley to the highest Yak camp (12,000 feet), as this was the most convenient jumping off place for the Diphuk La (Figs. 97, 98 and 99), which was now clearly visible in the early mornings, before the mist came up. Curiously enough, the weather was a little better at this height, and we had an occasional burst of sunshine, although just down the valley we could see massive banks of cloud fairly pumping rain over our old camp.

An ascent of the limestone range to 15,000 feet yielded a number of interesting plants, including the crimson *Primula cyclophylla* (one of the *Dryadifolia* section), and the tiny and unlovely *P. moschata*, another Sikkim plant. The dwarf alpine Primulas, apart from the fact that we cannot keep them, are too insignificant and colourless for the garden, but a form of *P.*

* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 19, April 9, 30, June 4, 18, July 30, and August 20, 1927.

bella which grow here was an exception to that rule. Peculiar also to the limestone range which crossed the valley here were the following: A prickly blue *Meconopsis*, like *M. Prattii*, *Rhododendron* 'Limestone Rose' (*Saluenense*) now in glorious bloom; a dwarf *Androsace* with carmine flowers; *Codonopsis* sp., *Solms-Laubachia* sp. (in fruit, mostly); and a new *Primula* of the *Muscarioides* section called *P. euchaites*, a rare plant, for I saw only two. The golden *Anemone*, too, was a limestone lover, and so was *Anemone rupicola* from the other side of the pass.

The long, steep slopes below the gaunt cliffs were well covered with flowers, including *Primula sikkimensis*, *Cypripedium tibeticum*, *Meconopsis Baileyi*, *M. violacea*, a yellow-speckled *Nomocharis* with fragrant flowers (much more abundant on the other side of the pass), *Salvia* sp., *Geranium* sp., *Pedicularis* spp., *Lloydia*, *Podophyllum*, etc. The streams also were filled with flowers, such as *Primula sikkimensis*, *P. Wardii* and the dusky-purple *P. apoclita*, one of the darkest of the *Muscarioides* section. On sheltered slopes and on the limestone cliffs also small shrubs grew in considerable profusion, and these included, besides *Rhododendrons*, several species of *Berberis* and *Cotoneaster*, *Ephedra*, *Pyrus*, *Cassiope*, *Juniperus*, *Lonicera* and *Daphne*; the only *Rhododendrons* seen growing on the limestone were the prostrate '*Saluenense*' called 'Limestone Rose' and two '*Lepidotums*,' one with purple, the other with yellow flowers, found growing on the cliff. There were plenty of *Rhododendrons* in flower here up to the middle of July, and these formed the bulk of the thickets on sheltered slopes; three '*Lapponicum*,' '*Scarlet Letter*,' a late form of *R. rivulare*, and others.

On cliffs and screes were *Primula bella*, a charming little plant crowded with bright violet flowers on slender stems a good inch high; *P. Genestieriana*, on the highest alpine turf slopes; *Polygonum Griffithii*, and other rock species; *Corydalis* sp., white *Morina*, *Helianthemum*, *Saxifraga*, *Senecio*, *Pinguicula*, and a big *Fritillaria*, like *F. Delavayi*. A peculiarity about the upper Seinghku was this: that, though the snow line was exceptionally high, not less than 16,500 feet, yet there was practically no alpine flora above 15,000 feet. That is to say, a thousand or fifteen hundred feet of barren rock was interposed between the limit of plants and the limit of permanent snow, suggesting that the retreat of the glaciers is really quite modern, and that the flora has not yet had time to take advantage of it; but, of course, the vertical nature of the topmost cliffs and their perpetual bombardment of the long screes which slope from their base, as well as the dreadful winds which rage at this altitude, are factors to be reckoned with.

While scrambling up the slopes towards the head of the valley, I came upon five plants, and five only, of a pale-yellow-flowered *Meconopsis* which at the time I did not recognise as *M. pseudointegrifolia*; it seemed a more dainty and slender plant with smaller flowers, which in one plant at any rate were almost ivory-white. But there can be no doubt that it is at most a geographical form of *M. pseudointegrifolia*. The deep red form of *M. impedita* was also very abundant on stony ground, and the more I saw of it, the more I liked it. Several times I caught a plant against the light, high up, and it gleamed with a ruby glow, which was a miracle of colour.

The best of the '*Lapponicum*' *Rhododendrons* was a bigish undershrub, growing so much as three feet to four feet high, with crisp, silver-grey foliage and dark purple-violet flowers, so dark as to be almost gloomy, relieved by a metallic shimmer of scales on the reverse. Here, again, the flowers required sunshine to be seen to advantage. While the higher slopes were often carpeted with dwarf *Rhododendron*, this species was not common there, but kept for choice to more sheltered nooks with '*Anthopogon*' species and other shrubs; nor did it form extensive colonies like the others, but occurred in scattered clumps in the valley. The third '*Lapponicum*' had small, purple flowers, and the tiniest bronzed leaves, with no very distinctive characters except all-round dwarfishness; it and the scented '*Lapponicum*,'

together with the '*Saluenense*' *R. rivulare*, formed the bulk of the moorland carpet. Besides the plants mentioned as peculiar to the limestone, I found a number of other species thriving there, *Isopyrum grandiflorum*—still in flower; *Potentilla peduncularis*, a violet '*Sibirica*' *Iris* (more abundant in the alpine meadows); a few small ground Orchids, *Cremanthodiums*, and so forth.

Thus the top end of the valley, where the Seinghku river had its source, was bounded by precipitous and rather barren cliffs, buttressed by huge, bare screes, with patches of meadow at the bottom of the valley, and strips of tangled thicket on the sheltered flanks. *F. Kingdon Ward.*

and often difficult plant to manage is also giving us a second crop of flowers, a concession for which we have to thank the watery summer.

As *Gentiana septemfida* passes out of bloom—and three or four varieties of this splendid species extend the flowering period to three months—the Willow *Gentians* open their season. Here again, there seems to be no limit to the number of more or less distinct forms which are included under the name of *G. asclepiadea*. In some of these now flowering, which were raised from seeds taken from a perfectly stiff and upright variety, and which have all reverted to the arching habit, the flowers are a clear, rich sapphire colour that would not disgrace *G. sino-ornata*. In the woodland where some of the

FIG. 98.—THE DIPHUK LA FROM THE BURMA SIDE; ANCIENT MORAINÉ IN THE FOREGROUND.

NOTES FROM A WELSH GARDEN.

MYRTUS nummularifolia, which, I am told, comes from the Falkland Islands, has proved quite hardy here, and that in a cold, low-lying, half-shaded part of the garden. Here it covers the soil with its thin net of slender, prostrate branches which are very brittle, and in colour a mahogany red that contrasts well with the dark green of the little, oval, leathery leaves. In early summer this delightful plant was starred with white flowers; now it is blooming again and carrying the fruits of its first crop. These fruits are as big as marrowfat Peas, white, with a tinting of pink, and they, like the blossoms, are held well up on the surface of the branches. The reader will be able to understand something of the conditions under which this charming Myrtle is prospering so well when I state that *Schizocodon soldanelloides* is close-by, enjoying a similar soil and position. This very beautiful

Gentians are growing, *Cyclamen neapolitanum* is flowering in quantity. *C. cilicium* is also here and a large colony of *C. europaeum* put in a few years ago is becoming nicely established and yielding a number of the pretty, sweetly-scented flowers.

Nertera depressa, which occupies a cavity beneath a shelving rock facing north, is well-berried. This engaging little plant was not a success here until that particular site was provided, and it is evidently just what it wanted. I should like to be able to do as much for *Parochaetus communis*. This beautiful Himalayan plant either does too well or it is feeble and sulky. This year it was tried in rather warmer, yet moist soil, but, owing to the wet season, it has ramped away, covering a couple of square yards with a heavy crop of lush, Clover-like leaves and has not yielded a flower. There are evidently many forms of this plant, and it may be that some bloom more freely than others.

Aster Thompsonii is another Indian plant, but, unlike the above, it is invariably reliable

here, never failing to give quantities of its refined, lavender-blue blossoms, and *A. T. nana* is equally satisfactory. *A. pyrenaicus* often leads one to believe that it will rival *A. Thompsonii*, but, though its colour is first-rate, its blooms do not seem to balance the rather heavy and downy leafage with which it is so generously endowed. Still, this is a useful late-bloomer for a cool place, and it does not look amiss with *Senecio elvorum* and *Buphthalmum speciosum*. *Symphytum officinale* var. *bohemicum* is of this herbaceous company, and it is one of the best of the Comfrees for the border. At any rate, it has been established three or four years in its present position and has not yet shown that passion for spreading so common to most of its race. It grows about two feet high and the flowers, of which a succession is maintained all summer and autumn, are a brilliant cherry-carmine. *Macrotomia* (*Arnebia*) *echioides* growing close by under similar cool conditions is another allied plant which has this year bloomed throughout the season. In spite of its merits, the Prophet Flower does not seem to be as popular as one might expect.

The very lovely *Geranium Farreri* has here every season expressed a very definite differentiation from its ally, *G. argenteum*, by flowering a second time, *i. e.*, in August and September. Last year this choice little plant ripened seeds which germinated freely. *G. sanguineum* var. *lancastrisense*, also in the rock garden, and that magnificent species, *G. anemoneifolium*, in the border, will maintain the reputation of their race with much distinction until late autumn.

The rainy season has suited most of the Heathers admirably, the slopes occupied by them being of light, dry soil. *Erica Williamsii*, supposed to be a natural hybrid between *E. Tetralix* and *E. vagans*, has done exceptionally well, after having been rather disappointing, which suggests that it needs more moisture than was considered sufficient. *E. vagans* var. *St. Keverne* is still without a peer in its own way, and the much newer white *E. v. Lyonesse* and cherry-crimson *E. v. Mrs. D. F. Maxwell* are worthy companions without being rivals. One of the most interesting features of a Heath garden at this season are the self-sown seedlings which, as they come to maturity, show such extraordinary diversity in foliage, flower and habit. Even some of the Tree Heaths, notably *E. lusitanica*, have become naturalised during the last year or so, and it is interesting to note that the beautiful *Daboecia polifolia alba* will produce self-sown seedlings exactly like the parent.

Eucryphia pinnatifolia has been flowering well throughout August, but *E. cordifolia* is not so successful here. Of this beautiful species—so admirably described and illustrated in *The Gardeners' Chronicle* of August 13—my specimen is only eight feet high and may do better when more mature. At present it does not make its new growths until so late in the season that they have no time to ripen before the advent of frost, with the result that they get nipped. *Pentstemon cordifolius* has been, and is still, a mass of red-crimson bugles, a colour which, like that of the Fuchsias, always blends very happily with the warmer tints of the approaching autumn. This applies also to *Berberidopsis corallina*, which has an unusually good crop of its almost globular, glossy, blood-red flowers, and to the curious crimson and yellow "lanterns" of *Abutilon megapotamicum*.

Abelia Schumannii is maintaining the great promise it made when first introduced to this garden some three or four years ago. It is a healthy and robust little shrub and produces an abundance of bluish-lilac blossoms of good size from early summer until the first frosts of autumn. The shrubby *Potentillas* are, of course, also noted for being all-season bloomers, but *P. manschurica*, a dwarf species with very large, pure white flowers, is a particularly useful and handsome little shrub for the later summer. Among the Fuchsias, the exquisite *F. recurva*, having accidentally proved as hardy as most others, is now left outside all the winter without any protection, and 15° of frost are not infrequent here. Variegated shrubs do not appeal to me as a rule, but some forms of *F. gracilis* with ivory and pale green leaves are very effective just now

in a mixed border, as is the old variety with foliage of a soft plum-purple. The clear blue of *Ceratostigma Willmottianum* strikes a note of distinction among these, but *C. Griffithii* is so slow in making growth that it is invariably overtaken by winter before it comes into flower.

Among the most pleasing of the shrubby Veronicas of the large-flowered section now blooming are the salmon-rose *Gauntlettii*; the rich crimson *Simon Delaux*; *Mont Blanc*, pure white; and an old variety with enormous inflorescences of violet-purple blooms. *V. Aoiria*, a neat, little, narrow-leaved species about two feet high, is always very generous with its small spikes of white flowers at this season, being preceded by the very similar shrub that came here labelled *Eversley Seedling*, and which carries a most amazing crop of fresh, rosy lilac blooms all the summer.

Hypericum aureum is one of the most distinctive of the shrubby members of its genus now flowering. It is an American species, with evergreen, blue-green leaves and terminal, upright clusters of flowers, in each of which the bunch of very fine stamens is, comparatively, so large and dense that the blossoms look like golden powder puffs. The habit is close and well-rounded, the height about three feet, and, as the branches usually start from a single stem, or short leg, the little shrub has a quaint and formal appearance. *A. T. Johnson, Ro Wen, Conway, N. Wales.*

NOTICES OF BOOKS.

The World's Food Plants.*

THOSE among our readers who can recollect reading and enjoying *Le Potager d'un Curieux*—of which the first edition appeared in 1884 and the last in 1899—will welcome a new volume from the pen of one of the collaborators in that unique work, namely, Monsieur D. Bois, now occupying the important position of Chef de Cultures at the Natural History Museum in Paris. The work in question, which is more or less a development of the *Potager*, is entitled *Les Plantes Alimentaires chez tous les Peuples et à Travers les Ages*, and it really does in great measure fulfil the promise of its very comprehensive title, so far as vegetables are concerned; we are promised a further volume, in which fruits will be dealt with. As the present volume consists of nearly six hundred large, closely-printed pages, it will be apparent that the author has given generously of the results of the painstaking and accurate researches which have occupied him for nearly half-a-century. Until 1908, when his friend and collaborator, M. Pailleux, died, the investigations which formed the subject matter of *Le Potager d'un Curieux* were carried on in M. Pailleux's garden at Crosnes, Seine-et-Oise; afterwards M. Bois continued them alone in the gardens of the Paris Natural History Museum—gardens which have been famous for centuries for their botanical value, for they were originally the "Jardin du Roi," whence issued so many plants new to western Europe, imported from all parts of the world and acclimatised and cultivated in the garden.

In an interesting introductory chapter, M. Bois sketches briefly the history of the domestication of plants which in prehistoric periods were used only as they were found growing, and neither cultivated nor preserved, those dependent on them for food simply moving on to other districts when food supplies appeared to be running short. It was not until the early Stone Age that attempts (and those of the most primitive description) were made to cultivate plants with the intention of providing food for a future period. There is, however, abundant evidence that the inhabitants of the lake dwellings (some of the earliest of which probably date back to the later Stone Age) had domestic animals, including the ox and sheep, and cultivated several different kinds of corn; they also grew Flax to produce linen for clothing, and made nets for fishing; the Pea, Bean and

Lentil were included among the crops they grew, while of fruits it is certain that they had Apples, Pears, Grapes and wild Plums, for seeds of all these have been found in their dwellings.

M. Bois is of the opinion that a good many vegetables now in common use among the poor in France, which are gathered from the fields and hedge-rows and used in their natural state, might be very much improved by cultivation and selection, thus definitely increasing the number and variety of available edible vegetables. In France, where gastronomy is a fine art, this might well be the case, but in this country the natural conservatism of the average cook would militate against the success of such experiments.

After careful consideration of the question of classification, the author has adopted—very wisely, in our opinion—that of Bentham and Hooker, which will eminently satisfy all who have had a botanical training. For those who have not, there is an excellent alphabetical index, which enables any required subject to be found immediately.

The scope of the work is so immense that in a short review it is not possible to do more than glance at a very few of the vegetables dealt with. The author has many interesting things to say about the Soy Bean, which was cultivated in very remote times in China under the name of Shu, yet has never been found wild in that country. It may, however, have been derived by cultivation and selection from an ancestral type, *Glycine ussuriensis*, which grows in many parts of China and in Manchuria. It was introduced into France about the middle of the eighteenth century, but has never been successfully acclimatised; though M. Bois and M. Pailleux made several attempts at Crosnes. Cucurbits occupy a large section, including the little-known—and more usually classed among ornamental than economic plants—*Momordica Charantia*. It may be news, even to some Cactus enthusiasts, that the fruits of *Echinocactus ingens* are edible. It appears that in Mexico they are commonly cut in slices and preserved in sugar, the resulting conserve being known as *Dulce de Visnaga*. Those who have tasted it say that it is excellent, and would repay importation into Europe.

The volume, which is par excellence the work of a savant, will inevitably find its way into every botanical reference library, and will, we feel certain, quickly become a classic, ranking with the pioneer work of de Candolle, to whom M. Bois generously acknowledges his indebtedness.

The illustrations, which consist of line drawings beautifully executed, are mainly the work of Madame and Mademoiselle Bois, who are greatly to be congratulated on their delicate and accurate delineations.

Trade Marks.

MESSRS. RAYNER AND CO., Patent and Trade Mark Agents, of 5, Chancery Lane, London, have just issued the second edition of their booklet entitled *Unbranded*,* which contains some very useful information on the value of Registered Trade Marks and the branding of goods, and points out the value of registered marks, both to the manufacturer and buyer. This subject is not sufficiently appreciated in the horticultural world, for, while every business firm is willing to insure premises against fire and other damage, few insure the goodwill of their business by procuring registered trade marks to defend their rights from infringement. All successful business men have recognised the importance of trade marks for their goods, and such trade marks or brands are the cheapest form of insurance that any commercial business can obtain to make certain the manufacturer or trader gets the full return orders that the quality of his goods entitle him to. The goodwill of a business is greatly increased by the position of these marks, and it is to be remembered that goodwill is something for the future and the steady increase of trade.

* *Les Plantes Alimentaires chez tous les Peuples et à Travers les Ages*. Par D. Bois. Paris: Paul Lechevalier, 12, rue de Tournon. Price 75 francs.

* *Unbranded*. Issued by Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will send a copy free to any of our readers on receiving their address on a post card.

When goods are exported to the Colonies or foreign countries it is very desirable that trade marks be registered in those countries, or the enterprising foreigner may produce and sell in those countries goods very similar to those produced by the original exporter. Registered trade marks are granted in Great Britain by H.M. Patent Office, and the fees are very small compared to the value obtained. The services of an expert are essential to avoid difficulties in obtaining registration and to comply with the regulations of the Patent Office.

NURSERY NOTES.

AN AFTERNOON WITH A POMOLOGIST.

MAIDSTONE is the business headquarters of the old-established firm of Messrs. George Bunyard and Co., but the principal nursery is at Allington, some few miles from the county town, where the famous Apple bearing that name was raised. Messrs. Bunyard and Co. have several other smaller nurseries in Maidstone itself, including one or two quite near to their headquarters, where is inscribed in big gold letters the nature of the business, which is made to include that of pomologists. Webster defines a pomologist as one who is versed in pomology and one who cultivates fruit trees. Plenty of persons may claim to be cultivators of fruits, but few are versed in pomology as a science; indeed, pomologists in this country are as rare nowadays as the old type of florist. The late Mr. George Bunyard had a most extensive knowledge of fruits and fruit culture and could lay full claim to the title, but his son, Mr. Edward A. Bunyard, has made fruit his hobby as well as business, and no one would dispute that he is the foremost pomologist in this country to-day.

He has made his home in the midst of some four hundred acres of fruit trees at Allington, and formed a library of books on fruit and fruit-growing, the equal of which is not to be found elsewhere.

On a most delightful afternoon—that of Friday of last week—it was our pleasure to visit Allington and spend an hour or two in the company of this enthusiastic gentleman, inspecting the fruit quarters and, later, some of the literary treasures which his library contains. Of course, the most serious side of the business is the raising and selling of large quantities of all kinds of fruit trees, but Mr. Bunyard likes to embark on what he facetiously terms “joy rides” from which no profit is derived, but much pleasure. For example, he has collected as many varieties of Gooseberries as he can secure with a view to classifying them and discovering if any of them are synonymous, whilst in another part of the nursery he has planted over two hundred varieties of Pears obtained from all over Europe, the United States of America, and elsewhere, to see whether any of them are of value in this country. Of the Gooseberries, he showed us three very late sorts of merit, namely, Glenton Green, Sandwich Yellow (syn. Cousin's Seedling) and Keen's Seedling, all of which, if planted as cordons on a north wall, would furnish berries of rich quality very late in the season. Mr. Bunyard considers the cordon system a very profitable method of growing this fruit, and where Gooseberry mildew is troublesome the very system of training reduces the damage from this disease to a minimum, for in shortening the branches to obtain the spurs a system of “tipping” results, and the fungus very seldom enters the harder tissue of the older leaves and wood.

Not much of merit has, so far, appeared amongst his Pear collection, but he has obtained what he considers a most valuable variety in Admiral Gervais, which was illustrated in *Gard. Chron.*, January 3, 1925. This Pear is of the Easter Beurré type, but has a much hardier constitution and will fruit well in the open as a bush. The flavour is excellent, and in Mr. Bunyard's opinion this is one of the best new Pears his firm has introduced for a long time. Mr. Bunyard was careful to point

out that none of these varieties will be sent out by his firm until its merits have been thoroughly proved.

Our host had some remarks to make on fruit tree stocks, and in his opinion there is no Apple stock superior to Rivers' Broad-leaved Paradise. Jaune de Metz is a valuable stock for dwarfing purposes, and many thousands of cordon and bush Apples are worked on this stock at Maidstone. We were shown several thousand three-year-old cordon trees on this stock and they were bearing splendid crops of such varieties as Egremont Russet, James Grieve, Ellison's Orange and Allington Pippin, whilst one plantation of four to five thousand trees consisted

A curious feature of this variety is that each Apple has a bud at the base of the fruit stalk, and these buds, with their rosette of leaves, are sufficiently strong to furnish a crop next year. There are a few other Apples that have this characteristic, including Worcester Pearmain. Another favourite Apple of Mr. Bunyard is Clarke's Seedling, which he considers keeps better than Bramley's Seedling, and has excellent cooking qualities. Another Apple he favours is Easter Orange, a late dessert variety raised by the Messrs. Hillier of Winchester, but his favourite of all dessert Apples is Orleans Reinette, and he gives the palm to Golden Noble as a cooker. His selection of four culinary

FIG. 99.—RHODODENDRON SP. AND MAGNOLIA GLABRA ON THE SLOPES OF THE DIPHUK LA.

Acers, Deutzias, Hydrangeas, &c., in the foreground. (see p. 210).

wholly of Cox's Orange Pippin. Some of the stocks are so dwarfing as to be of no value; for example, the one known as *praecox*. Mr. Bunyard showed us a tree of Cox's Orange Pippin worked on the Nonesuch stock, the fruits of which never colour, while others worked on the true Doucin stock, although they have made smaller trees, always produce fruits of grand colour. Mr. Bunyard is of the opinion that the stock has a great influence on the nature of the fruit.

Of the very large number of Apples cultivated at Allington, Mr. Bunyard places high value on Belle de Boskoop, a variety of the Blenheim Pippin type, which keeps until May, is of excellent dessert quality and retains its acidity late in the season. He informed us that this variety of Apple is grown all over Europe, but is not very well-known in this country. Some trees he pointed out to us were cropping magnificently, and they come into bearing at a much earlier age than trees of Blenheim Pippin.

Apples for a succession is either Rev. W. Wilks or Early Victoria, Old Hawthornden, Golden Noble and Dumelow's Seedling.

As we passed through the nursery our guide was constantly pointing out interesting things, only a few of which we had time to jot down. We saw the Chinese early Cherry, fruits of which were exhibited at one of the R.H.S. meetings early in the year. This Cherry has very big foliage and will fruit in a cold house in May. It is a very free cropper, and as it flowers long before other Cherries are out, the inference is that it is self-fertile.

The stocks of stone fruits, such as Plums, Cherries, Peaches, etc., are remarkable healthy, and probably better this season than ever, for whilst nurserymen everywhere have had trouble with weeds, they have no complaints on the score of poor growth, and the wood appears to be ripening well.

Of the Plums, Mr. Bunyard pointed out the new Evesham Wonder, a red form of the yellow Pershore Plum. It makes exceedingly strong

growth, some of the maiden trees having shoots eight feet long. The stems have characteristic red colour. A great number of Cherries in standard form are in demand by the Cherry growers in his county, and of these trees the Allington Nursery contains a splendid stock.

The old orchard which visitors to Allington know well—planted some thirty years ago—is well cropped this season. All the trees are trained as large bushes or really on short stems with a series of radiating, cordon-like growths. This method of growing Apples in orchards is far superior to the old half-standard or standard system, as the trees can be attended to much easier and the crop harvested with half the trouble.

Amongst the great wealth of Apples and Pears introduced or re-introduced in recent years, Mr. Bunyard considers the best are Orleans Reinette, Belle de Boskoop and Pit-maston Pineapple Apples; Laxton's Superb, Admiral Gervais and Beurré Six Pears; whilst of the Strawberries he gives the palm to the Old White Pine. In the garden attached to his home, Mr. Bunyard has a number of interesting trees and shrubs, as well as a collection of wild Pear species. His specimen of *Pyrus Sargentii* is one of the most beautiful in this country, and at the present time is a mass of scarlet fruits. His garden also contains a grand specimen of *Pyrus floribunda purpurea*, the dark-flowered form which produces claret-coloured fruits, and many other interesting things which would need more space than we can spare to describe.

We may conclude with a few remarks on Mr. Bunyard's library, which contains a representative collection of books published on fruits in all countries. He has the works of many early Italian authors, including Bussato's treatise published in 1590, which is the first work with drawings of the processes of grafting and budding. Another notable book is the treatise of agriculture of Crescentius, who wrote in the thirteenth century, and whose book was one of the earliest of printed works. Mr. Bunyard showed us some of the big volumes, with exquisitely coloured plates, published in France and Italy in the last century by Poiteau and Risso; the faithfulness of the coloured reproductions in these books has never been excelled. The library includes the works of several Russian pomologists, also hundreds of pamphlets and old catalogues, the last including that of the great Pear raiser, Van Mons, printed in 1823, which is probably the only one in this country. Another interesting catalogue is the first published by Messrs. Vilmorin Andrieux et Cie., of Paris. Mr. Bunyard has most of the modern works on fruit and fruit-growing, as well as those of the classic authors who treated on gardening, such as Pliny, Columella and the Greeks, and the commentators upon them, indeed, he has collected—and still collects—everything which might serve to illustrate the history of fruit-cultivation in particular and gardening in general.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, Ante pp. 131-137).
(Continued from p. 194).

MIDLAND COUNTIES.

BEDFORDSHIRE.—The year 1927 will surely rank as one of the most remarkable for climatic changes. The winter was very mild with very few sharp frosts; the real touch of winter was from April 27 until May 1, 10°, 7°, 9°, 8° and 4° being registered. With all this frost it seemed impossible that any fruit could be left, but no doubt owing to the air being very dry, much of the blossom escaped injury. We have a fine show of Apples of all varieties, except Cox's Orange Pippin, which is only a moderate crop. All other varieties are over the average yield; Bramley's Seedling and Rev. W. Wilks show the result of the frost in a brown marking around the eye; this, fortunately is only skin deep, so should not affect the cooking quality. Scale

has not made its appearance up to date. Pears are under the average yield, but we have fruits of most varieties. The trees have been badly attacked by slug worm this year, but aphids has not been so troublesome as usual. Apricots are a poor crop. Peaches and Nectarines are yielding splendidly, with fine foliage, and there is not much die-back or leaf-curl diseases. Figs have also withstood the 1926 severe frosts and have made good growth and promise a fine show of fruit. We have a good average crop of Plums on wall trees, Kirke's being especially good. Victoria and Pond's Seedling are about average in yield, with Gages just over the average. Strawberries Royal Sovereign, The Duke and Admiral have fruited splendidly, but all late varieties failed owing to Red-leaf, not a late fruit being edible. Red and Black Currants have borne extraordinarily remarkable crops and of very fine quality, with no aphids and no run-off, as are usual. Gooseberries have also given an over-crop of fine quality berries. Raspberries are also splendid, Lloyd George being especially fine. The soil is of a sandy nature. *W. G. Warner, Chicksands Priory, Shefford.*

—Red Currants are by far the best of the small fruits, both as regards quantity and quality. Black Currants were badly crippled by the late frosts in many places near here, but they were a fair crop in this garden. The following Apples have failed entirely, although the trees were covered with blossom: Pott's Seedling, Worcester Pearmain, Ribston Pippin and Cox's Orange Pippin, and the crop of Dumelow's Seedling (Wellington) is very thin—although the blossom was profuse. The soil around this locality is most variable, being very sandy in parts, and in others good, sandy loam, a spade or so deep. Underlying these stratas in some parts of this garden there is a liverish-coloured clay. *Charles Turner, Amphill Park Gardens, Amphill.*

BUCKINGHAMSHIRE.—All fruit trees produced an abundance of bloom, but the severe frosts during April, and especially on the 26th-27th of that month, destroyed the greater part of it; only trees in very sheltered positions partly escaped. Strawberry beds in exposed positions were practically destroyed. Small fruits are an average yield, and the quality fairly good. Stone fruits in some orchards are almost nil. The soil in this part of Bucks is mostly very heavy and cold, and the natural drainage bad. *W. Hedley Warren, Sunnymead, London Road, Buckland, Aylesbury.*

—The fruit crops are of average quantity, but Strawberries were a very poor crop. Apples, Plums and Cherries are all good. The soil is very loamy, and fruit trees and Roses do remarkably well here if we get plenty of rain; if not, the soil, being very fine and loamy, soon dries up. All fruit trees look very healthy and clean. *George Humphrey, Finefield Gardens, Bath Road, Slough.*

—The fruit crops this year have been very good. Currants and small fruits cropped in abundance. Filberts are not so plentiful this year as usual, but Walnuts are very good. *Albert Adams, Ridgeway, Bledlow Ridge, West Wycombe.*

—The Apple crop is variable; Bramley's Seedling has a poor yield, but Early Victoria Lane's Prince Albert, Lord Derby and Newton Wonder are fair to good, and there is a good yield of Worcester Pearmain, James Grieve, Ellison's Orange, Cox's Orange Pippin and Allington Pippin. Many of the fruits are dropping. Pears are a very light crop. Plums are patchy; Early Rivers is a good crop, and we have a fair number of Czar, Monarch, and Pond's Seedling. Gages are plentiful in some parts and few in others. In some orchards there are good crops of Aylesbury Prune Damson and none in others. This Plum is realising £30 per ton. *Philip Mann, Education Sub-Office, Aylesbury.*

—The fruits crops are, as a whole, very good. Strawberries were especially good; the plants escaped injury by frosts in May. Apples are an average crop, Pears light, and stone fruits plentiful, excepting Peaches and Apricots

which were much damaged by the frosts. The soil is light and loamy, with a subsoil of chalk. *William Arthur Bright, Hughenden Manor Gardens, High Wycombe.*

—The fruit crops in general are very good. We have an extra heavy yield of Bramley's Seedling, Newton Wonder and Cox's Orange Pippin; all three sorts have been thinned on bush trees. Pears in the open are a failure; on walls some varieties have a moderate crop, others none. Strawberries were very good, the varieties Royal Sovereign, Leader and Givon's Prolific gave heavy crops, and the plants have vigorous foliage, those one-year-old being much superior in growth and fruit to those two years old. All small fruits were extra good. The soil is a gravelly loam on chalk, and the gardens are sheltered from wind. *Wm. Camm, Cliveden Gardens, Taplow.*

(To be continued).

FRUIT REGISTER.

THE CAMBRIDGE GAGE.

THIS Gage is probably a seedling from the well-known Green Gage, and is largely grown around Cambridge, being usually raised from suckers. There are certainly many different seedlings grown, but the variety I have selected is the same as grown at Merton for pollination experiments, and, in my opinion, is one which deserves wide cultivation.

The flavour of the fruit is extremely good, whether quite equal to the old Green Gage or not there are varying opinions, but it is certainly very close. Its great advantage over its parent is that it is partly self-fertile, so that a single tree can be planted, the old Green Gage requiring another variety to pollenate it. Beyond this, is its great value in cross-pollinating other varieties, in which respect it is of great value. According to Mr. Crane's exhaustive experiments at Merton, it secures a good crop when its pollen is used for the following varieties:—Allgrove's Superb, Blue Rock, Coe's Golden Drop, Coe's Violet, Kirke's Blue, Late Orange, President and River's Early.

Those who fail with the old Green Gage might do well to try this variety, which is so near to it in flavour and superior in many other respects. *E. A. Bunyard.*

VEGETABLE GARDEN.

'SEED' POTATOS.

DANGER OF VIRUS DISEASES.

It has long been known that a better crop of Potatos may be obtained by the use of Scotch "seed." This fact has become still more pronounced during recent years. It has been commonly attributed to the fact that Scotch "seed" is usually more immature than English "seed." There may be some advantages in the use of so-called immature "seed," but the chemical composition has been studied by biochemists who have found no significant difference between the composition of mature and immature seed Potatos after they have been stored for two or three months. They conclude that maturation is completed during storage.*

There is a far more important reason for the superiority of Scotch "seed," namely, its greater freedom from virus diseases. The writer knows of a case when once-grown seed of the variety Great Scot was grown as a field crop to test its yield against fresh Scotch "seed" of the same variety. Little difference was found with this variety, but a great difference was found when a similar trial was made with other varieties, and still greater was the difference between Scotch "seed" and seed that had been twice-grown. It is a significant fact that the variety Great Scot is, perhaps, the most resistant we have to the two virus diseases, Mosaic and Leaf Roll. The gradual degeneration that is found on repeatedly saving "seed" from the

* Appleman and Miller, *Journ. Agr. Res.* V. 33, p. 560.

same lot of Potatoes is due to the increased infection by these virus diseases.

Virus diseases are caused by some infiltrable organism, soil toxine or profound physiological disturbance, the nature of which is not yet known. In Potatoes, two of these diseases are extremely prevalent in England, viz., Leaf Roll and Mosaic. Nearly every Potato crop is more or less infected, and the diseases threaten to become a most serious menace. Garden and allotment crops usually suffer more than field crops.

An infected crop is fairly easy to detect. The plants present an irregular appearance, many of them being small and unthrifty. Those with Leaf Roll have their leaves rolled up at the edges showing the under surfaces, which are rather light and sometimes appear silvery. The leaves seem dry and harsh to the touch.

Mosaic disease causes a very faint mottling of the leaves, usually more noticeable after rain. The leaves may be smaller than normal and are usually wrinkled. In extreme cases there is no proper growth, only a few dwarf, curled shoots.

When the tubers are lifted they show no obvious signs of disease, but are mostly small in size, and the crop may be reduced to a third or half its normal weight.

It is known that these diseases are spread by aphides and other leaf-sucking insects which transfer the virus from one plant to another. A healthy plant may also be infected by rubbing it with any part of a diseased plant. The greater prevalence of virus diseases in gardens is explained by the fact that leaf-sucking insects are more numerous than in fields.

The Scotch Potato crops do not suffer so severely from virus diseases because of the cooler summers. Temperature is an important factor in the distribution of aphides, and in Scotland, where it is cooler, they are not so prevalent. They become more prevalent as one goes farther south and it is found that the extent of infection with virus diseases is greatest in the south of England. Further north than Scotland, in Sweden, varieties of Potato, such as Magnum Bonum, which succumbed to virus diseases ("degenerated") in this country are still grown successfully.

It is important to realise that, although Potatoes come from the tropics, most species naturally grow at a height of 6,000 to 14,000 feet in Peru, Bolivia and Venezuela. They are therefore, in reality, a cool season crop, the normal conditions of growth being intense light, a mean temperature of about 60°F. at all times of the year, and a very heavy fall of dew at night.

The cooler climate of Scotland in summer may be more nearly suited to the natural requirements of the Potato, the longer day in Scotland compensating for the greater intensity of light in the natural habitat. The Potato might, therefore, be expected to be more resistant to diseases under these conditions.

No variety of Potato has yet been introduced that is entirely resistant to both Leaf Roll and Mosaic, and it is therefore essential to check the spread of the disease so far as possible. For this every care should be taken to avoid the use of infected "seed." Any tubers taken from a plot where there are any diseased plants are liable to be infected. Growers who save their own "seed" should make sure that their crops have no infected plants before the haulms are down. If any plants in the crop appear to have virus diseases, it will be cheaper in the long run to buy Scotch "seed" than to risk raising a crop with most of the plants infected, and giving a very low yield. It should be remembered that an apparently healthy plant may have been infected; this has been proved by experiment.*

Another important precaution against the spread of these diseases is to make certain that every single Potato in a crop is lifted, and that no "rogues" are left to infect the next season's crop. Some people recommend the cutting off of infected tops so soon as they appear, but this may only mean that infected tubers are left in the ground. Another check to the diseases is to spray for aphides if they are observed. The best preventative is, however, to use good "seed." C. O'Connor, B.Sc., (Horticulture.)

* Stewart, F., N.Y. Agr. Sta. Bull. 422. 1916.

HOME CORRESPONDENCE.

The Spraying of Potatoes.—I am engaged in lifting maincrop Potatoes. The date is early, but there is no advantage in allowing the crop to remain in the soil longer as the plants are badly attacked by late blight (*Phytophthora infestans*). Certain varieties reveal a higher degree of susceptibility than others, but all have fallen victims to the disease to such an extent as to render them quite unfit for storage. The condition of my own crop is typical of Potatoes generally in south Wales. There is a difference, however, in the approach to the result. I have sprayed my crop twice with Burgundy mixture, whereas few, if any, of my neighbours have sprayed at all. Naturally, I am perplexed and struggling with the question as to whether it is worth the while to spray Potatoes in a wet season. The protective film is certain to be washed off the haulm, leaving a clear field for the activities of the fungus. If one were to renew the film as often as it is broken the cost would be prohibitive. This is not my first disappointing experience in the matter of spraying Potatoes in a wet season, and I have almost decided not to repeat the process. I should indicate that the Burgundy mixture was applied through a very good Holder-Harriden Knapsack Sprayer by a painstaking workman, and all the aerial parts of the plants were treated. For the purpose of testing the advantage of cutting off diseased haulm, I isolated six rows of maincrop Potatoes. These were carefully watched and when it was obvious that the leaves could not function usefully, the haulm of three rows was cut down to within nine inches of the ground, and on three rows it was allowed to remain. There is a marked difference in the condition of the tubers at the present time. Beneath the cut stems they are sound, so far as the eye can tell, but disease lesions are numerous on the tubers which have carried haulm until lifting time. This note is written from the county of Glamorgan, in which the average annual rainfall is between forty and forty-five inches. Geo. H. Copley, N.D.H.

Treatment of Golf Greens.—My attention has been drawn to an article on the above subject which appeared in *The Gardeners' Chronicle* on July 23. The general strain of that article is completely subversive of much of the accepted opinion on "The treatment of Golf Greens." Coming, as it does, from a paper of such acknowledged standing as *The Gardeners' Chronicle*, this article is bound to carry considerable weight, and I therefore venture to ask if you have the support in these statements of any recognised authority on grasses or manures, or chemical action in the soil. The statement that fine grasses, suitable for golf greens, thrive best in an acid soil, is a most surprising one. In all my experience of farming and gardening, I have never found anything to thrive in an acid soil, except Fog grass or moss, or such weeds as Buttercup, Daisy, etc. The statement that "sulphate of ammonia and ammonium phosphate augment soil acidity," has, until recently, been pretty generally accepted, but the opinion of the best scientific authorities to-day is that these manures do not augment soil acidity. Practically all sandy soils are super-acid, and it has constantly been the aim of those dealing with such soils, to counteract this acidity by the application of lime, the general experience being that where lime is non-existent, or present only in a small degree, and where there is a lack of the three principal plant foods, Fog or moss so asserts itself that the fine natural grasses are quickly killed out. As the outcome of a general desire for more exact knowledge as to golf green culture, a Scientific Advisory Committee for the United Kingdom was instituted about two years ago, this Committee consisting of some six or eight of the leading scientific authorities on soils and manures in the United Kingdom. This Committee made up four separate formulas for manures for golf greens, and four separate formulas for manures for fairways and sea-side courses, and an equal number of formulas for greens and fairways for inland courses, and these manures are now being tested in various districts. In every case this Committee avoided sulphate

of ammonia and superphosphate, probably because these had hitherto been suspected of acidity, and have recommended instead that the nitrogen should be in the form of dried blood or fish manure, and the phosphate in the form of steamed bone-flour or bone-meal. Ammonium phosphate, by the way, is not a commercial term, but, what is known chemically as ammonium phosphate would be supplied in a mixture of sulphate of ammonia and superphosphate. With regard to your statement about the beneficial results of applications of sulphate of ammonia alone, it is a matter of the most elementary knowledge that sulphate of ammonia contains only one element of plant food, and that of a very stimulating or forcing nature. The three chief elements of plant food are—nitrogen, as supplied in sulphate of ammonia, nitrate of soda, dried blood, etc.; phosphorus, as supplied by superphosphate, bone-meal, bone-flour, etc.; and potash, as supplied by kainit, sulphate of potash, etc. A chain is only as strong as its weakest link. Sulphate of ammonia will produce grass in abundance so long as there is a supply of phosphates in the soil, but to supply sulphate of ammonia alone is analogous to feeding a man on champagne. There must be the three constituents present to give a properly balanced plant food. It is no doubt in the interest of certain manufacturers to support an extensive use of sulphate of ammonia, but those who persist in this method of treatment for any length of time, unless other plant foods are also being supplied, will find undoubtedly that the last state of their greens is worse than the first. If this proposition were put to any shrewd farmer, he would at once say you are simply purging your soil. It is the kind of thing the farmer might possibly do when leaving his farm, and wanting to take every ounce of goodness out of the soil. The results, mentioned in your article, which have been obtained at Keighley Golf Course and at Stoke Poges, can undoubtedly be got anywhere by applying slight dressings of sulphate of ammonia. The effect will be seen almost immediately in a greater growth of grass of a dark green colour, but that is only a temporary effect. The nitrogen quickly expends itself, or is washed out of the soil, and the soil is the poorer for the effort it has made. With regard to the reduction of weeds, all that need be said is that if you starve a child, or an animal, it will produce diseases; if you starve the soil, it will produce weeds such as Buttercup, Daisy, moss, etc., while if you feed the soil, there will be no room for weeds to grow. The farmer kills out weeds in his soil by producing heavy crops of grain or Turnips, or wild White Clover. All that is advocated in your article seems to have emanated from America. Americans look for quick results, and these they will get from sulphate of ammonia, but the fine green swards on the English college lawns were not made by hasty impulse; and before adopting any new "discovery," I hope the caretakers of these lawns will await conclusive proof of its real value. I am not writing this in support of destructive criticism. I have been closely associated for many years with golf green committee work, and would gladly welcome anything new or of proved value, but we must always guard against anything that may have merely the self-interest of the producer behind it. W. L. Paterson, Aberdeen. [We shall deal with this subject again in due course.—EDS.]

Growth of Melons under Vitaglass.—When I recently visited the gardens at Stagshaw House, Corbridge-on-Tyne, Northumberland, the residence of J. C. Straker, Esq., I was shown the effect that vitaglass has on plant growth. A Melon house there has half the roof glazed with ordinary glass and the other half with vitaglass. When I looked in this house I thought something must be wrong with the plants, for on some of them the fruits were half grown, while on the others they had only just set. Mr. Hay, the gardener, informed me that they were all planted on the same day, were all strong, healthy plants, and that the difference was due to one half being grown under vitaglass and the other under ordinary glass. The results I saw go far to prove that vitaglass has a great effect on plant growth. W. McCombie, Newton Hall Gardens, Stocksfield-on-Tyne.

SOCIETIES.

SANDY HORTICULTURAL.

THE fifty-fourth show of this society was held at Sandy Place (by kind permission of Mrs. Graves) on Thursday, August 25. The entries constituted a record for this Society, and, considering the season, the exhibits of flowers, fruit and vegetables were of a very high standard. Despite the heavy rain that fell during the morning of the show, which reduced the ground to a quagmire, the attendance was, on the whole, very good, and the sun shone during the afternoon; by 5 o'clock over 11,000 visitors had passed through the gates.

Groups of hardy flowers and Roses were tastefully displayed in one large tent. In the class for a group of hardy cut flowers arranged for effect on a space twenty feet by eight feet, Mr. FORSYTH, Pulteridge Park, was successful, and Messrs. CHILLERY, Fenstanton, were placed second. For a collection of Roses arranged

notable prize-winners were LADY JULIET DUFF, Kingston Hill, whose exhibit of black Grapes was very good, and Mrs. CARL HOLMES, who showed the best Muscat Grapes.

Vegetables are always of a high standard at this show; for a collection of nine distinct kinds, Dr. C. J. WELCH, Mogerhanger (gr. Mr. W. R. Pettifer), was an easy winner. This exhibitor also won several prizes in the single dish class for vegetables, other prize-winners being the EARL OF SANDWICH, Mrs. CARL HOLMES and W. ROBINSON, Esq., Marford. The last-named was placed first for a collection of six varieties of vegetables and also for a collection of Potatoes.

In the cottagers' section there were 150 more entries than in the previous year; the produce being of exceptional merit and well displayed, the chief prize-winner being Mr. ROBINSON, Great Marford.

Table decorations were accommodated in one large tent. For a table decorated with Roses, Mrs. HARKNESS, Hitchin, who was first, used Betty Uprichard effectively. The

fine set, and if only a good competition could be obtained the class would be a fine one.

The Brunton Challenge Cup for three vases, distinct, was won by Mr. CHARLES WALL, Bath, with Bath Beauty, Glorious and Dixie; Messrs. C. ENGELMANN second, with Rouge, Dainty and Improved Circe.

A glorious vase of lovely blooms of Laddie won for Messrs. C. ENGELMANN, LTD., the American Challenge Cup offered for the best fifty flowers of this variety, but here again the Saffron Walden firm had a walk-over.

The best-scented Carnation—the winner of the *Daily Mail* Cup—was the crimson variety, Mrs. A. J. Cobb, shown by Mr. A. F. DUTTON, Iver.

Messrs. C. ENGELMANN, LTD., secured the George Monro Silver Cup for twenty-five crimson flowers with good blooms of Topsy, and obtained first prize for fifty flowers in three or more varieties, with examples of Topsy, Maine, Sunshine, Laddie, Red Laddie, Benora Rouge, Duchess of York, Hebe and White Pearl; second, Mr. T. SHAW, Calgarth Park, Winder-

FIG. 100.—SOUTHPORT SHOW: CENTRAL PORTION OF MESSRS. ALEX. DICKSON AND SONS, GROUP OF ROSES.
(see p. 198).

on tabling fifteen feet by four feet, Messrs. HARKNESS AND Co. were placed first for a grand display of choice, clean flowers of such varieties as Lady Inchiquin, Betty Uprichard, K. of K., Madame Butterfly, Los Angeles and Orange King. The same exhibitors were first in the class for forty-eight cut Roses. Messrs. J. CHEAL AND SONS won three first prizes for collections of Dahlias, which are very popular in the Sandy district. Messrs. DANIELS BROS. made a fine display with Gladioli and Phloxes, while Messrs. W. AND J. BROWN, Peterborough, had a fine exhibit of Roses, and Roses were also shown well by Messrs. LAXTON BROS.

For a collection of hardy fruits in ten varieties, the EARL OF SANDWICH (gr. Mr. W. Prowting) was an easy first prize winner; second, J. O. FARE, Esq. (gr. Mr. A. Gillings); while Mrs. CARL HOLMES (gr. Mr. W. Penton), was third.

For a collection of ripe dessert fruits, the EARL OF SANDWICH was again first, showing good Nectarines, Peaches and Melon Universal. J. O. FARE, Esq., second. The EARL OF SANDWICH also excelled in the classes for six Peaches, six Nectarines, green and scarlet-fleshed Melons and dessert Plums. Other

best table decorated with Sweet Peas was arranged by Mrs. G. MYERS, Bedford, and the best decorated with Carnations by Mrs. D. R. MOORE, Kempston.

BRITISH CARNATION.

THIS important floricultural society held its thirty-fourth show at Southport in conjunction with the Southport Floral Fete, on August 24, 25 and 26. The exhibition was excellent, the competition good and the flowers of capital quality. Many of the important people in the Carnation world were present, including Mr. A. T. Mason, Mr. W. H. Page, Mr. W. E. Wallace, Mr. C. Engelmann, Mr. K. Luxford, Mr. Willis, Mr. P. F. Bunyard (Secretary), Mr. C. Wall and Mr. J. S. Brunton.

The George Monro Silver-Gilt Cup, offered for the best seven varieties of Carnations, twenty-five blooms of each, shown in seven vases, was awarded to Messrs. C. ENGELMANN, LTD., Saffron Walden for lovely blooms of Blanche, Orange Sunstar, Red Laddie, Saffron, Master Michael Stoop, Laddie and Sheila Green. This was a

mere; third, Mr. H. HUNTER, New Lane, Crossens, Southport.

Mr. C. WALL led for three vases of three varieties of distinct colouring with Laddie, Topsy and Mrs. C. W. Ward; Messrs. C. ENGELMANN, LTD., second, with Improved Ward, Laddie and Red Laddie.

In the colour classes, Messrs. C. ENGELMANN, LTD., led for a white variety with White Pearl; for a medium pink sort with Hebe; for the best red variety with Red Laddie; and for any other colour, with the scarlet-flaked Duchess of York. Messrs. ALLWOOD BROS. scored for a deep pink variety with Master Michael Stoop. Mr. H. T. MANN had the best light pink variety in the fine Magnum. Mr. C. WALL led in the crimson class with Topsy, the other three competitors showing the same variety.

Mr. T. SHAW had the best vase of Messrs. Stuart Low and Co.'s novelties, and Mr. B. FEENY, Blundellsands, the best vases of twenty-five blooms, mixed colours.

In the colour classes, five blooms of a variety, Mr. R. HARPIN, Cranbrook, Blundellsands, led for a medium pink sort with Eileen Low; for a red variety with Tarzan; for a crimson

sort with Topsy; for any other colour, with Master Michael Stoop; Mr. T. W. SIMPSON, Ashton-on-Ribble, for a white sort, with White Pearl; Mr. F. HATHAWAY, Baldersby Park Gardens, for a deep pink sort.

Mr. SIMPSON won the Lord Howard de Walden Cup for the best dozen plants of perpetual-flowering Carnations with a fair set. Mr. HARKER led for six plants.

The Cory Cup offered for a decorative arrangement of Carnations was won by Mr. J. F. HANMER, Pinewood Towers, Conway, with a pretty arrangement of good blooms; second, Mr. J. HATHAWAY.

The Covent Garden Cup, offered for the best three vases, two baskets, three sprays and three button-holes of Carnation blooms, was won by Messrs. ARLINGTON, Hull, with a very bright collection; equal second, Messrs. W. J. GARNER AND SON and Messrs. W. ARTINDALE AND SON.

MESSRS. C. ENGELMANN, LTD., led for a pair of packed boxes of Carnation blooms with handsome flowers of Laddie and Topsy; second, Mr. W. H. PAGE, Hampton, who sent Saffron and W. H. Page.

Mr. E. WALKER, Radcliffe-on-Trent; Mr. F. W. SIMPSON, Ashton-on-Ribble; and Mr. R. HARPIN and Mr. W. B. FEENY were very successful in many other classes.

Mrs. C. ENGELMANN, obtained first prize for a dinner table decoration of Carnations, using the variety named Coral Glow; second, Messrs. ARLINGTON, Hull, with crimson and blush flowers; third, Miss C. BRUNTON, Burnley, with blush-pink flowers.

HIGHLAND HORTICULTURAL.

A VERY meritorious exhibition was held at Inverness by the members of this society. Mrs. Mackintosh, wife of The Mackintosh of Mackintosh, gave the show a happy send off in a delightful little speech in which she described flowers as one of the joys of her life.

There were some remarkably fine entries in the pot plant classes. The Hon. Mrs. SMYTHE, Ness Castle, Inverness (gr. Mr. W. Ross), led for six foliage plants, six plants in bloom, and for Carnations and Coleus. From the gardens at Muirtown (gr. Mr. Peter Macdonald), came the best Ferns, Begonias (single and double), Fuchsias and Pelargoniums.

Cut Flowers provided the most attractive division in the show. From Brodie Castle (gr. Mr. J. Annand), came the best hardy herbaceous cut flowers, Sweet Peas, six bunches of annuals, and Colerette Dahlias. The EARL OF MORAY, Darnaway Castle (gr. Mr. A. Dow), ran the Brodie Sweet Pea exhibits very close. From Darnaway Castle came the best six trusses of cluster Roses and the best twelve Antirrhinums. Milnfield (gr. Mr. H. Fraser) sent the best Cactus Dahlias, and Muirtown (gr. Mr. P. Macdonald) showed the best Asters. Mr. J. MACQUEEN, Laggan Gardens, won premier honours for twelve Roses, Violas, Pansies and French, striped Marigolds. From the far-away Island of Scalpay, Sir H. BELL led finely for hand bouquets and border Carnations or Picotees. Mr. J. H. SMITH, Summerfield, staged greatly admired Roses.

In the fruit classes, Mr. W. Ross, Ness Castle, showed the best black and white Grapes. Those from Eileanach were also very good, but they lacked the finish and bloom of the Ness Castle exhibits. The EARL OF MORAY had the best collection of fruits, the best Black Currants, Red Currants, Raspberries and Loganberries. For Nectarines, dessert Apples, Pears and Strawberries the chief honours went to Muirtown.

A fine display was made in the vegetable section, but Potatos did not come up to the usual standard one is accustomed to find here. The "blue riband" here was awarded for the best display of vegetables—twelve dishes, distinct—and Laggan (gr. Mr. James Macqueen), worthily gained the premier honour with finely-grown produce. From the same gardens also came the best Celery, Onions and Parsley. The EARL OF MORAY led for Peas, French Beans, Parsnips and Beetroots with capital specimens.

Some very fine exhibits were shown by amateurs; the leading prize, a Silver Cup presented by Lady Invernairn, was won by Mr. W. J. SHAW, Ardochattan, Inverness, for a collection of eight dishes of vegetables. This being the third occasion on which Mr. SHAW has won the Invernairn trophy, it now becomes his own property.

CRANLEIGH HORTICULTURAL.

IN the district of West Surrey, where every village is surrounded by mansions, where every cottager has his garden, and flower shows are numerous, it may seem somewhat invidious to refer to any one village in particular, but it so happened that the writer chanced to visit Cranleigh on Wednesday, August 17, on one of the few fine days in the month, when the flower show was being held.

In point of numbers, although the exhibits exceeded those of last year and totalled 667, this was not a record, but the quality of the produce was of a very high standard. In all classes vegetables were good, and fine Potatos were much in evidence.

It was, however, in the non-competitive section that an exhibit from Sir FREDERICK HALL, M.P., Grafham Grange, near Bramley, lent distinction to the entire show. This exhibit occupied a space of fifty feet in length by three feet in width, and contained ninety-one varieties of vegetables, some of them in several varieties, notably eighteen varieties of Potatos, ten of Vegetable Marrows, eight of ornamental Gourds, and so on. There were also thirty-nine varieties of fruits, including eleven of Apples, ten of Plums, four of Grapes and three of Peaches. Indeed, this group was noteworthy for the excellence of the Grapes, Peaches and Melons, and it included a Pineapple and Monstera deliciosa—rare fruits in a village show. These varied products were associated with many choice and beautiful flowers, among which were Bougainvilleas and Oleanders, with groups of other more familiar favourites, such as Gladioli, Nemesis, Scabious, Statice, Delphiniums, Lupins and Rudbeckias. This fine collection would have done credit to a more pretentious exhibition, and it reflected great credit upon Mr. G. E. Saunders, the gardener. Before Sir Frederick Hall bought Grafham Grange, some eight years ago, Mr. Saunders was his gardener at Streatham. W. F. S.

DUNDEE HORTICULTURAL.

AUGUST 25, 26 AND 27.—In brilliant sunshine, Lady Lloyd, wife of the Governor of Egypt, gave a happy send off to the annual exhibition of the Dundee Horticultural Association, held on Magdalen Green, Dundee on the above dates. The entries numbered 1,391, a decrease of about seventy compared with last year—the centenary year; the show was visited by 26,000 people, the gate receipts amounting to £1,071, an increase over the 1925 show of £44. The exhibition was altogether remarkable considering the variable and unreliable season experienced, and fully justified the claim made by Lady Lloyd that Dundee had now reached the proud position of holding one of the three most important annual flower shows in the United Kingdom.

POT PLANTS.—A very high standard of quality was reached in this division, the blue riband in which was the Corporation Challenge Cup, open to professionals only, and awarded for the best four plants, foliage and/or flowering, distinct. The trophy was won by Miss GIBSON, Inverlay, Dundee (gr. Mr. George Reid), for plants of Statice, Clerodendron, Ixora and Oncidium. The judges added to the award a Cultural Certificate for the Statice. But the success of the Inverlay exhibits did not end here, for Mr. Reid also carried off leading honours for exotic Ferns, Pelargoniums, British Ferns, Palms and Alpines. Mr. W. D. GRIEVE, Hazelwood, Gardens, Broughty Ferry, had a close entry for the Corporation Cup. Single and double Begonias in flower, distinct, made a fine display. The most successful exhibitor was Mr. T. E. BROWN, Balcairn Gardens, and he

secured the leading place for Cordylines. Mr. GRIEVE excelled in the class for foliage plants and Lilliums with finely-grown and much admired entries. From Lismore (gr. Mr. J. Dick), came the best three Coleus, while honourable places in the prize list were also taken by Colonel TYRIE, St. Helens, Dundee (gr. Mr. T. Dobbin); ARCHIBALD RETTIE, Esq., Seafeld Lodge (gr. Mr. J. Margach); DOUGLAS NAIRN, Esq., Elmslea (gr. Mr. James Smart); Mr. CHARLES BRICKNAL, gardener, Fernbrae Nursing Home; GEORGE BONAR, Esq., The Bugties, Broughty Ferry (gr. Mr. Martin Taylor); LORD KINNAIRD, Rossie Priory (gr. Mr. J. McGregor); and T. H. H. WALKER, Esq., Tighnamuirn (gr. Mr. William Peebles).

CUT FLOWERS.—The display of blooms in the marquees devoted to this division proved a source of great pleasure to the large number of visitors. The herbaceous and hardy annual classes provided the keenest competition, the judges describing the former exhibits as the finest ever seen in Dundee, not merely from a quality point of view, but also from effective and artistic arrangements. In the Sweet Pea classes the entries were not numerous. The Challenge Trophy presented by Mr. D. J. Macdonald, of Tighanard, Broughty Ferry, for the best display of Sweet Peas on a table ten feet by five feet by two feet high, was won by Mr. GEORGE REID, Rouken Vale Gardens, Downfield. First prizes for a bowl of Sweet Peas, hand bouquet and basket of Roses also went to Rouken Vale. From the gardens of Binrock, Dundee, Mr. JAMES BEATS showed exquisite bouquets of Sweet Peas and baskets of cut flowers. In the class for annuals, open to all, the leading honours also went to Binrock, and for twelve vases of herbaceous flowers.

Some very fine exhibits were also shown by Mr. GEORGE SCOTT, Ochterlony Gardens, Guthrie, including Sweet Peas, Roses and cut flowers. Gladioli were finely shown by Mr. J. M. ROBERTSON, Leuchars, the decorative effect and the superb quality of the individual spikes being greatly admired. First prizes for summer-flowering Chrysanthemums and Dahlias were won by Mr. W. HUNTER, Delvine Gardens, while Mr. J. DICK, Lismore, was awarded leading places for border Carnations and Colerette Dahlias. Mr. C. BRICKNAL, gardener, Fernbrae Nursing Home, led finely in the class for Asters followed closely by those from Ochterlony.

FRUIT.—Competition in the fruit classes was exceedingly keen. In the section open to professional gardeners some fine Grapes were shown. COLONEL TYRIE, St. Helens (gr. Mr. T. Dobbin), was successful in winning first prizes for the best four bunches of Grapes of three varieties, one bunch of Lady Downes variety, one bunch for bloom, and he had the best bunch of a variety other than those scheduled. LORD KINNAIRD, Rossie Priory (gr. Mr. J. McGregor), was also a prominent prizewinner in the Grape classes, and prizes were also won by DOUGLAS NAIRN, Esq., A. BUST, Esq., Taypark (gr. Mr. J. A. Nicoll); and Sir WILLIAM HENDERSON, West Park (gr. Mr. Alex. Cowieson). The best Peaches were from Rossie Priory Gardens, while A. S. HENDERSON, Esq., Seathwood (gr. Mr. James Henderson), secured the leading award for Nectarines. There was keen competition for the best collection of six dishes of hardy fruits, and the entry from H. LYALL, Esq., Old Montrose (gr. Mr. R. Duncan), was successful. This exhibit included perfectly formed and exceptionally fine Gooseberries, Raspberries, Plums, Cherries, Apples and Pears. Mr. LYALL was easily the leader in the fruit classes, but when it came to the section for Apples he had no compeer. He led in the class for twelve distinct varieties grown in the open, showing three fruits of each, and won seven first prizes in the remaining fourteen classes for different varieties of Apples; and this fine career of success he repeated in the classes for Pears and Plums, but LORD KINNAIRD proved a serious rival for Plums, having some exceedingly fine entries.

Among the other successful exhibitors in the fruit classes were A. RETTIE, Esq., Seafeld Lodge (gr. Mr. J. Margach); Mr. WALKER, Tighnamuirn (gr. Mr. W. Peebles); A. S. HEN-

DERSON, Esq., Seathwood (gr. Mr. James Henderson); D. H. W. RITCHIE, Esq., Dura, Cupar (gr. Mr. D. Pullar); GEORGE BONAR, Esq., The Bugties (gr. Mr. Martin Taylor); Mr. CHARLES BRICKNALL, Fernbrae Nursing Home; Mr. N. HORSBURGH LOW, Roselea, East Newport; Mr. H. TAIT, Errol, and Mr. W. GOODALL, Errol.

VEGETABLES.—For a collection of vegetables, twelve kinds, distinct, on a table not exceeding seven feet by four feet, Mr. PETER KERR, Braefoot, Carnoustie, had a capital win. Mr. JOSEPH DICK, Lismore, carried off Colonel Tyrie's prize offered for the best collection of vegetables, six distinct kinds, comprising three Cauliflowers, four Celery, six Leeks, six Onions, six Carrots and six Beets. Mr. DICK also led for Leeks, Parsnips and Celery with finely-grown specimens. Potatoes made a fine show, and here Mr. DAVID DALRYMPLE, Ratheluan, Fife, was very successful, as he was also for Onions. Mr. W. HUNTER won the leading places for Beans and Cauliflowers, while H. LYALL, Esq., who did so well in the fruit classes, showed the best Turnips. First prizes were also gained in this division by Mr. W. BOWSE, Craiglea; Mr. G. SCOTT, Ochterlony; Mr. W. PHILIP, Forfar; Mr. A. P. MOIR, Tayview, Broughty Ferry, and Mr. D. PULLAR, Dura, Cupra.

There was not a great display in the nursery-men's classes so far as numbers went but, as is always the case with nurserymen, the quality was first-class. Mr. W. FERGUSON, Dunfermline, led finely for twelve Roses, one variety, and for six vases of Roses, distinct, while Messrs. D. AND W. CROLL, Dundee, had the finest twenty-four Roses, H.P. or H.T., distinct.

Some fine produce was shown by amateurs, and all concerned had great reason to be proud of the exhibits their care and devotion had brought to such perfection. The Corporation Challenge Cup offered for the best four plants, two in foliage and two in flower, distinct, was awarded to Mr. R. MOORE, 17, Cleghorn Street, Dundee, for remarkably well-grown plants in excellent condition. Mr. MOORE also won *The Gardeners' Chronicle* Medal. In the cut flower classes, Mr. W. H. SCOTT, Moncrieff Terrace, Dundee, was the most prominent winner, taking leading places for Dahlias, Carnations, fancy and show Pansies and a bowl of Carnations. The most successful exhibitors in the fruit classes were Mr. J. PEARSON, Castle Terrace, Newport, and Mr. N. TAIT, Ardenlea, Errol. Mr. PETER DONALDSON, Station Cottages, Blackford, earned warm congratulations for his wide range of entries, including two collections of vegetables which gained first prizes, and he also led for Tomatoes, Cucumbers, Shallots, Marrows, Beets, Kidney Beans and Parsley.

NON-COMPETITIVE EXHIBITS.

As is usual at Dundee, the trade exhibits by nurserymen and florists added not a little to the great success of the show. Large Gold Medals were awarded to Messrs. THYNE AND SON, Messrs. D. AND W. CROLL, Messrs. HARLEY AND SONS, Messrs. W. P. LAIRD AND SINCLAIR, LTD., Messrs. STORRIE AND STORRIE, Messrs. ALLWOOD BROS., Messrs. ROBERT STEWART AND SONS and Messrs. C. ENGELMANN, LTD.

Messrs. GEORGE PATON AND SON and Messrs. THOMAS MURRAY AND SON were awarded Gold Medals, and the ST. FORT ARTIFICIAL STONE Co. and Mr. WILLIAM CLARK, horticultural builders, Silver Medals.

PAISLEY FLORISTS'.

THE autumn show of the Paisley Florists' Society was held on September 1 and 2 for the first time in the more commodious premises of the Clark Town Hall. The change attracted additional entries and non-competitive exhibits were more numerous. Excluding the industrial section, the schedule contained 116 classes.

The open classes were poorly represented, a contributory influence being the policy of the

Society in substituting Gold and Silver Medal Certificates for prize money. Mr. WILLIAM FERGUSON, Dunfermline, was awarded the first prize for thirty-six blooms of Roses and six vases of decorative Roses. Mr. JAMES LAIDLIER led in the class for twelve spikes of Gladioli, and Mr. R. MACAUSLAN occupied a similar position in the class for six vases of Pompon Dahlias.

Pot plants and cut flowers were shown extensively in the competitive section, but the quality compared somewhat unfavourably with that of previous years, except in the Chrysanthemum exhibits staged by Major BROWN, Westerlea, which were outstanding for such a late season. He was also awarded the premier honours for Begonias, Collette, Pompon and Coltness Gem Dahlias, Roses, Carnations and Picotees, winning thirteen first prizes in all. Other successful exhibitors were Mr. D. GRAHAM (six table plants, two Coleus, two single Begonias and three vases of self-coloured Antirrhinums), Mr. T. HARVEY (two foliage plants and four exotic Ferns), Mr. J. POPE (Pansies and Violas), Mr. R. MACAUSLAN (two house plants in flower, and twelve blooms of Begonias), and Mr. A. CARMICHAEL (six bunches of annuals, six bunches of herbaceous flowers, six vases and three vases of Sweet Peas and six Pentstemons).

The fruit exhibits were disappointing. Mr. H. BRUCE excelled with a collection of six varieties grown in the open, while Mr. D. MCARTHUR was placed first for Peaches and for black and white Grapes.

Keen competition ruled in most of the vegetable classes, the principal prize winners being Mr. T. COUPER (eleven firsts), Mr. NEIL WHYTE, Mr. D. GRAHAM, Mr. A. COOK, Mr. T. HARVEY, Mr. H. BRUCE, Mr. H. JUDD and Mr. William JACKSON.

NON-COMPETITIVE EXHIBITS.

The centre of the hall was occupied by a large and varied collection of Palms and flowering plants arranged in effective colour groups by the Superintendent, Mr. I. M. Fleming.

Sir JOHN REID, Ardenraig, Bute, showed Gladioli primulinus in variety, and a representative collection of Astilbes. Mr. ROBERT SHAND, Meikleriggs, staged orchard house fruit, and Mr. HUGH MORRIS, Bishopston, had a table of herbaceous flowers.

Trade groups were exhibited by the SCOTTISH WHOLESALE CO-OPERATIVE SOCIETY, Mr. JAMES LAIDLIER, Paisley; Mr. JOHN MCFIE, Paisley; and Messrs. ALEXANDER LISTER AND SON, Rothesay.

ROYAL HORTICULTURAL.

THE following awards have been made to the undermentioned flowers by the Royal Horticultural Society after trial at Wisley.

Annual Poppies.

AWARDS OF MERIT.

Somniferum Type.—*The Bride and Snowball*, both sent by Messrs. W. H. SIMPSON AND SONS; *Bright Lilac*, sent by Messrs. JAMES CARTER AND CO; *Miss Sherwood*, sent by Messrs. BARR AND SONS.

Shirley Type.—*Picotee*, sent by Messrs. BARR AND SONS and Messrs. WATKINS AND SIMPSON. *Shirley, Selected Mixed*, sent by Messrs. BARR AND SONS; *Shirley Mixed*, sent by R.H.S.

Nudicaule Type.—*Sunbeam Improved*, sent by Messrs. G. STARK AND SON.

Species.—*Papaver apulum*, sent by the CHELSEA PHYSIC GARDEN.

HIGHLY COMMENDED.

Somniferum Type.—*Cardinal*, sent by Messrs. W. H. SIMPSON; *Scarlet*, sent by Messrs. JAMES CARTER AND CO.; *May Campbell*, *White Swan* (Snowdrift), and *Charles Darwin*, these three sent by Messrs. BARR AND SONS; *White*, sent by Messrs. HEINEMANN AND CO.; *Cardinal White*, sent by Messrs. DOBBIE AND

Co.; *The Admiral*, sent by Messrs. HEINE MANN AND CO.

Shirley Type.—*Deep Pink*, sent by Messrs. WATKINS AND SIMPSON; *Salmon Rose*, sent by Messrs. DAHNFELDT AND JENSEN; *Snow Queen*, sent by Messrs. BARR AND SONS; *American Legion*, sent by Messrs. WALLER-FRANKLIN; *New Double Queen*, sent by Messrs. BARR AND SONS; *The Shirley Mixed*, sent by Messrs. W. H. SIMPSON, Birmingham, and Messrs. DOBBIE AND CO; *Ryburgh Hybrids*, sent by Messrs. G. STARK AND SON.

Nudicaule Type.—*Coonara*, sent by Messrs. G. STARK AND SON.

Species.—*Papaver glaucum*, sent by Messrs. DAHNFELDT AND JENSEN; *P. setigerum* sent by Messrs. BARR AND SONS; *P. umbrosum*, sent by Messrs. DAHNFELDT AND JENSEN; *P. pavoninum* (Peacock), sent by Messrs. BARR AND SONS.

COMMENDED.

Shirley Type.—*The Shirley Selected*, sent by Messrs. WATKINS AND SIMPSON.

Aquilegias.

AWARDS OF MERIT.

A. coerulea var. *Mrs. M. Nicholls*, sent by Messrs. ZWAAN AND VAN DER MOLEN and Messrs. J. CARTER AND CO.; *A. glandulosa*, sent by Messrs. BARR AND SONS.

HIGHLY COMMENDED.

Rose and Pink Shades, *Longspurred*, and *Longspurred Blue Hybrids*, all sent by Messrs. J. CARTER AND CO.; *Mrs. Scott Elliott's Strain*, sent by Messrs. WATKINS AND SIMPSON, Messrs. DANIELS BROS., and Mr. W. H. SIMPSON; *Selected*, sent by Messrs. BLACKMORE AND LANGDON; *Diadem*, sent by Messrs. ED. WEBB AND SONS; *Selected Hybrids*, sent by Messrs. ZWAAN AND VAN DER MOLEN; *coerulea*, sent by Messrs. WATKINS AND SIMPSON; *Olympica*, sent by Messrs. BARR AND SONS; *pyrenaica grandiflora*, sent by Messrs. BARR AND SONS.

COMMENDED.

Longspurred Mixed, sent by Messrs. STUART AND MEIN; *Longspurred Hybrids*, sent by Messrs. WATKINS AND SIMPSON.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AT the meeting held at Southport Flower Show on Wednesday, August 24, the members of Committee present were: Messrs. J. B. Adamson (in the chair), A. Burns, B. Collins, A. Coningsby, J. Evans, J. McCartney, D. McLeod, G. V. Llewelyn, A. Keeling, W. J. Morgan, and H. Arthur (Secretary).

FIRST CLASS CERTIFICATES.

Cattleya Hardyana var. *Royal Crimson*, *C. Hassallii* var. *Hercules*, *C. Vesta* var. *Madonna*, *C. Irene* var. *Queen Elizabeth*, *C. Lorna* var. *Princess Royal*, *Laelio-Cattleya Profusion* var. *Royalist*, *L.-C. Fowleri* var. *Mammoth*, *L.-C. Minosa* var. *magnifica*, *L.-C. Hassallii* var. *The Premier*, *Brasso-Cattleya British Queen* var. *Enchantress*, and *Odontioda Lorna*, *Gerrish's* var., all from J. B. ADAMSON, Esq.

Cattleya Momus var. *Duchess of York*; *Brasso-Cattleya Evansiae* and *Laelio-Cattleya Soulangue* var. *Empress*, from Mr. JOHN EVANS.

Cattleya Aeneas (*Dowiana aurea* × *Venus*), *Laelio-Cattleya Monarch* (*Serbia* × *aurea*), and *L.-C. Profusion* var. *Medric*, from Messrs. J. AND A. McBEAN.

Cattleya Heliodor var. *Golden Gem* and *Odontonia Olivia* var. *Princess*, from Messrs. CHARLES WORTH AND CO.

Brasso-Laelio-Cattleya Ursula var. *Princess Elizabeth* (a Gold Medal being also awarded), from Messrs. A. J. KEELING AND SONS.

AWARDS OF MERIT.

Cattleya Eleanore var. *Comet*, *C. Vestey* var. *Purity*, *C. Hardyana* var. *The Sultan*, *C. Hardyana* var. *Jupiter*, *Laelio-Cattleya Queen Mary* var. *Lustre*; *Sophro-Laelio-Cattleya Magnet* var. *Crimson Glow*, and *Odontioda Romany* (*Odm. specabile* × *Oda. Brewii*), from J. B. ADAMSON, Esq.

Cattleya Luegeae var. *Vivid*, *C. Emily* (*Hesta* × *Enid alba*), *Laelio-Cattleya Profusion* var. *Teutonic*, *L.-C. Profusion* var. *Pacific*; *Brasso-Cattleya Innocence* (*C. Enid alba* × *B.-C. Bianca*); *Odontoglossum Ovidius* (*Felicity* × *St. James*), and *Odontioda Cooksoniae* var. *Vivid*, from Messrs. J. AND A. McBEAN.

Cattleya Hardyana var. *Dracula*, *C. Helga*, *Odontioda Brackenhurst* var. *atro-rubens*, *Brasso-Cattleya Pallus* var. *grandis*, *Odontoglossum St. Mungo* and *Odontonia Corona*, from Messrs. CHARLESWORTH AND CO., LTD.

Cattleya Hardyana alba, *Llewelyn's* var.; *Laelio-Cattleya Warrior*, *Llewelyn's* var.; *Cypripedium Llewelyn Knight* (*Corneyanum* × *Selene*) and *Odontoglossum majesticum*, *Llewelyn's* var., from G. V. LLEWELYN, Esq.

Cattleya Hardyana alba, *Vestey's* var.; *Laelio-Cattleya Profusion*, *Warren* var.; and *L.-C. Perseus* var. *sulphurea*, from the Hon. G. E. VESTEY.

Cattleya suavior var. *excelsa*; *Sophro-Cattleya Salonica*; *Brasso-Laelio Admiral Jellicoe*; and *Odontioda Kittie*, from Messrs. STUART LOW AND CO.

Cypripedium Baldwinii (*Lord Wolmer* × *Charlesworthii*) and *Odontioda Marton* (*Odm. waltonense* × *Oda. Charlesworthii*), from Messrs. A. J. KEELING AND SONS.

Odontioda Zenobia var. *The Sultan*, from Alderman HY. ASTLEY-BELL.

AWARDS OF APPRECIATION, FIRST CLASS.

To *Laelio-Cattleya* var. *Brilliant*, from J. B. ADAMSON, Esq., and to *Cypripedium leyburnense* var. *Robin Hood*, from G. V. LLEWELYN, Esq.

CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Odontioda Romany*; *Odontioda Madeline* var. *Ruby*, *Epidendrum vitellinum* and *Oncidium leucochilum*; to Messrs. J. AND A. McBEAN, for *Odontoglossum Aphrodite*, *O. Theseus*, *O. wylamense* and *Oncidium Leopoldianum*.

GROUPS.

Gold Medals for groups were awarded to J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes); The Hon. G. E. VESTEY, Birkdale (gr. Mr. B. Collins); Messrs. CHARLESWORTH AND CO., LTD., Haywards Heath; Mr. JOHN EVANS, Colwyn Bay; Messrs. A. J. KEELING AND SONS, Bradford; and Messrs. J. AND A. McBEAN, Cooksbridge.

Large Silver-Gilt Medal to G. V. LLEWELYN, Esq., Southport.

Silver-Gilt Medal to Messrs. STUART LOW AND CO.

Large Silver Medal to Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns.)

The next meeting will be held at the Houldsworth Hall, 90, Deansgate, Manchester, on Friday, September 16, 1927.

TRADE NOTES.

PATENTS AND TRADE MARKS.—Readers requiring information and advice respecting Patents, Trade Marks or Designs, should apply to Messrs. Rayner and Co., Patent Agents of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

Obituary.

W. J. Godfrey.—Heart failure was the cause of the death of Mr. W. J. Godfrey, of Exmouth, on August 27. The deceased gentleman, who was sixty-nine years of age, occupied a foremost position in the horticultural world at a time when exhibition Chrysanthemums were more popular than they are to-day—indeed, his name was a household word among Chrysanthemum specialists. For many years he carried on the nursery business at Exmouth, and was an especially clever raiser and grower of Chrysanthemums, Regal and Show Pelargoniums, Oriental Poppies and Canterbury Bells. Many well-known Chrysanthemums bear his family name, and it will be a long time before Molly Godfrey, a single variety, will be entirely superseded. A sensitive man, Mr. Godfrey was also a keen critic, and on more than one occasion he severely criticised the work of the National Chrysanthemum Society, on whose Committee he occupied a position for a long period. Unfortunately, good health did not attend him in recent years, and his many friends greatly regretted that good fortune also failed to smile upon him. Mr. Godfrey took a large interest in local affairs and was once Mayor of the town of Exeter. A portrait and appreciation of Mr. W. J. Godfrey appeared in *The Gardeners' Chronicle* of December 6, 1924.

Alfred Edward Prince.—As these pages go to press we learn with very deep regret of the death of Mr. Alfred Edward Prince, of Longworth, Faringdon, one of the most noted raisers and growers of Roses. The deceased gentleman had been in failing health for some time past, and recently underwent an operation in a nursing home at Reading. For some little while after the operation we heard that he was making a favourable recovery, but alas! he passed away early in the morning of Tuesday, September 6.

ANSWERS TO CORRESPONDENTS.

AMERICAN PILLAR ROSE WITH FLATTENED STEM.—H. V. W. The flattening of the stem described belongs to the class of abnormalities known as fasciation. Little is known as to the causes of fasciation, which is common in all groups of vascular plants.

BRACKEN IN NEW GARDEN LAND.—W. H. H. It is likely that strong roots of the Bracken would send up a considerable proportion of leaves the first year, even though buried under two spits of soil, because there would be plenty of reserve food in the rhizomes to lengthen the leaf stalks in their efforts to reach the light. They would not be unmanageable, however, amongst such crops as Potatoes, Cabbages and other strong growers, or even Peas and Beans where the Dutch hoe could be freely used, say, once a fortnight, up till August or September. The land itself and the vegetables would be much benefited by this frequent hoeing. There would not be many crops of Bracken fronds in a season, because the rhizomes have to develop a considerable length between every two fronds. Every time a frond is cut it means a great waste of reserve food, and the rhizomes would soon get exhausted. As the turf is the best part of the soil, it would be best if this were kept within a foot of the surface. This could be done by bastard trenching the land, forking over the bottom spit, then turning the top spit of the second trench on to the bottom, face downwards. The loose soil or crumbs could then be thrown on to the top of this first spit, and that would give sufficient depth for the roots of the vegetables. Bracken may be reduced two-thirds of its vigour by one cutting in June, when the roots are not disturbed; but where vegetables are concerned it is best to commence hoeing so soon as the leafy part of the frond is above the soil. It would not be advisable to sow Carrots Onions or similar crops the first year,

with the Bracken rhizomes at that depth, though it would be quite practicable the second year, if the Bracken is never allowed to unfold the leafy portion of the frond the first year. So soon as the turf is rotted, it would be easy to remove the rhizomes at the second digging, by keeping an open trench the depth of the spade and then forking over the spit beneath it.

IRISES FOR GARDEN BORDER.—T. Plant the Irises in threes, at the points of a triangle, leaving one foot of space between the clumps of three. There will be two rows as the space does not allow of three, and there will be not much more than a foot between the rows. This will allow twelve to thirteen clumps of three in each row, i.e., from thirty-six to thirty-nine plants in each row, or about seventy-two plants altogether. In addition to Gajus, Isoline, Porsenna, Prosper Laugier, and Madame Gaudichau, we recommend Fro (yellow), Alcazar, Lord of June, Rhein Nixe, Asia (Asia can now be bought for 2s. 6d.) Prospero and Le Neige (white). Yellow and white sorts will be wanted to relieve the darker colours. We therefore recommend 9 Gajus; 9 Fro (yellow); 9 Rhein Nixe (white and crimson); 3 La Neige or White Queen—the latter is not so good as La Neige, but there is no really good cheap white; Mrs. Horace Darwin is still considered worth growing by many people, and is very free, which La Neige is not; 6 Isoline; 6 Porsenna; 6 Prosper Laugier; 6 Madame Gaudichau; 6 Alcazar; 6 Lord of June; 3 Asia and 3 Prospero. Do not mix lime with farmyard manure, but if lime is necessary apply it a month or more in advance of the manuring. Irises require very little manure. If the ground is limed very little bone-meal will be needed. Do not plant the rhizomes too deeply.

NAMES OF FRUITS.—G. E. S. Plum Prince of Wales.—*Heatherbank*. Gascoyne's Scarlet.—A. S. 1 and 3, Gladstone; 2, White Astrachan.

NAMES OF PLANTS.—A. H. W. *Pleroma macrantha*; 2, *Rudbeckia Goldstrahl*; 3, *Campanula*; species not recognised; 4, *Anthemis tinctoria*; 5, *Rudbeckia speciosa*; 6, *Helenium autumnale*. *Interested*. 1, *Myrtus communis*; 2, one of the hybrids of *Veronica speciosa*. G. E. S. *Morus nigra* (Mulberry).

TOMATOS AND CHRYSANTHEMUMS UNHEALTHY.—A. J. G. Your Tomato plants show signs of Stripe disease in the top. This disease is caused by *Bacillus lathyri*, and infection was probably seed-borne. The roots of your Chrysanthemums have been infected by a fungus, *Fusarium* sp., which is the cause of the wilt. Plants standing in the open have received a good deal of rain this year and where insufficient drainage has been provided, the water has lain too long in the pots. This condition leads to infection by *Fusarium*. A thunderstorm frequently affects plants in such a way that any diseases from which they may be suffering are brought to a head some days after the storm and, while there was no sign of injury by lightning, it may have affected your plants in this way. It will be difficult to cure the plants, but we advise watering them with Uspulun dissolved in water at the rate of one part of the dry powder in four hundred parts of water.

WIREWORMS IN SOIL.—J. M. The most effective remedy for the destruction of wireworms is gas-lime. As you propose to plant Tomatos, you should apply the gas-lime at the rate of 28 lbs. to every cartload of soil used, mixing it very thoroughly and turning the whole of the material over several times during the following eight weeks. It will not be advisable to use the ground for a crop before this period, as only by then will the poisonous properties of the lime be dispersed.

MARKETS.

COVENT GARDEN, Tuesday, September 6th, 1927.

WE cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS.—The improved weather has benefited all out door flowers. Asters, in particular, show a considerable increase in numbers, and they are much better in quality. Chrysanthemums are also more plentiful, the latest to arrive being the bronze varieties, Almirante and Alvira; there is more "spray" both in white and coloured varieties. Carnations are still arriving in large quantities, and their prices vary according to quality, the cheaper blooms being most plentiful. Best quality Roses are not too plentiful, and these, like Carnations, fluctuate in price. Gladioli are practically over for the season. The quantities of Lilium longiflorum exceed the present demand and prices are on the down grade, but L. lancifolium, both white and pink, also Lily-of-the-Valley, are still in short supply. Physalis is gradually improving in quality and selling more freely. Gardenias are the most plentiful of choice white blooms, Stephanotis and Lapagerias being somewhat shorter in supply. Orchid blooms are only obtainable if ordered in advance. Fairly large quantities of Dahlias are on offer, but there is very little demand for these flowers. Michaelmas Daisy King George is the newest subject in this department.

REMARKS.—One of the features of the fruit market is the comparatively poor prices of English Apples. The quantities are large, but the general standard of quality is not high, evidence of which is the difficulty of finding really well-packed, bright-coloured samples of Worcester Pearmain and large cookers, also the comparatively good prices such fruit is making. Plums are selling fairly well and the prospects for Monarch, which is just commencing to arrive in the market, should be favourable to good prices. Hothouse Grapes, Peaches, Nectarines, Figs and Melons are selling moderately well. English Pears so far have been plentiful, mainly of the more common varieties. Pears from Italy, France, Belgium and California are meeting

a good demand. English Tomatoes are in better supply and sell fairly well. Cucumbers, however, are a bad trade, from the growers' point of view, the demand for them being very slow. Cultivated Mushrooms are a good trade, although a few from fields are arriving in competition with them. The vegetable salesmen report indifferent conditions for almost everything they are handling, except a few good Peas, which are wanted. The Potato trade remains much about the same as last week, with a downward tendency in prices.

GLASGOW.

THE improvement in the prices of cut flowers recorded in our previous issue made further progress during the past week despite the large daily supplies. Chrysanthemums in particular were very plentiful and met with a ready sale at advanced values. No. 1 white ranged from 1s. 6d. to 2s. (6's); Countess and Debutante, 1s. 6d. to 1s. 9d.; Elsie Heady, 1s. to 1s. 4d.; Holicot Bronze, 10d. to 1s. 2d.; Holicot Yellow, 9d. to 1s. 2d.; No. 2 pink, 2s. to 2s. 6d. per dozen; No. 1 bronze, 1s. 6d. to 2s.; Phoenix, 1s. 3d. to 1s. 6d.; Phoenix (large sprays), 8d. to 1s.; and Loan's pink, crimson and yellow, 6d. to 8d. per bunch. Gladioli were worth 1s. to 2s. per dozen; Carnations, 1s. 3d. to 1s. 9d. per dozen; pink Roses, John C. M. Mensing and Madame Butterfly, 1s. 6d. to 2s. 6d.; Mrs. Herbert Steven and Richmond, 1s. to 1s. 6d. per dozen. Prices of Lilium rubrum and L. longiflorum (Harrisii) averaged 3s. 6d. per bunch; Sweet Peas, Calendula and Statice realised 2d. to 4d.; Marguerites, 2d. to 3d.; Asters, 1d. to 4d.; Gypsophila paniculata, 4d. to 6d.; Smilax, 1s. 6d.; and Asparagus, 9d. to 1s. per bunch.

Business in the fruit market was well maintained. Victoria Plums sold at 7d. to 9d. per lb.; Switzen Plums at 9s. to 10s. per sieve; Egg Plums at 8s. to 9s. and Damsons at 9s. to 10s.; Gooseberries fetched 3s. to 3s. 6d. Lord Derby Apples, selected, sold for 24s. per cwt.; Worcester Pearmain, 6s. to 8s. per bushel; and American Gravenstein, 12s. to 15s. per case. Sunkist Oranges were worth 19s. to 22s. per case. The value of other fruits was: French Beurré Hardy Pears, 13s. to 14s. per crate; Scotch Muscat Gages, 4s. per lb.; English Gros Colmar Grapes, 1s. 6d. to 1s. 9d.; and Dutch Black Grapes 8d. to 9d. English Gages, were cheap at 6s. per 24 lbs.; and Californian Plums realised 18s. for Giants, and 15s. 6d. for Grand Duke.

In the vegetable department Marrows and Cucumbers made 4s. to 6s. per dozen; Cauliflowers, 4s. to 8s.; Lettuce, 1s. to 2s.; Broad Beans, 6s. per pot; dwarf Beans, 6s. half-pot; and French Beans, 3d. to 6d. per lb. Scotch Tomatoes realised 7d. to 8d. per lb., and Jersey Tomatoes, 5d. to 6d.

THE ENGLISH ROCK GARDEN

Price £3 3s. (postage extra 1/3)

No one who owns a rock garden, and who loves Alpine plants, can afford to be without this delightful work, which reflects so faithfully the genius of its dead author, the late Reginald Farrer. It is in two big volumes, full of deeply interesting and extraordinarily valuable information.

Can be obtained from:

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 55.7°.

ACTUAL TEMPERATURE—
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, September 14 10 a.m. Bar. 29.9. Temp. 60°. Weather, Showery

WHEN summer is giving its lavish display of blossom in the garden—and even this summerless summer has been amazingly generous in blossom—the needs for the future of the garden must not be neglected. For, indeed, though procrastination is the thief of time, it is a giver of much tranquility. And yet the good gardener knows that if bulbs are to play their supremely beautiful part in the spring garden and also in late summer and autumn they must be got into the ground in good time. Late-planted bulbs may sometimes make a brave display, but that is only a concession to the lucky, and every gardener knows that although others enjoy garden luck, the successes of his own garden are due to pains and forethought. There is, of course, another and cogent reason for ordering bulbs early. The best are always, as it were, on the top of the basket, and late comers must, perforce, be content with plants of lesser worth. And what a wealth of choice there now is! Home-grown Daffodils and Tulips at least as good—we would dare even to say better—as those grown abroad. Proof of this should be forthcoming in the London parks this year when, following on the memorable display of Dutch bulbs last year, English-grown bulbs are to be planted in an almost infinite variety. There are also the Hyacinths—the stiff,

proud ones, and those with delicacy of form and colour, and these the Dutch growers must provide us with; for up till now the soil of this country—even the magic soil of Lincolnshire—has not succeeded in growing Hyacinths successfully. Then there are the lesser, but no less beautiful bulbous things, the Crocuses and Scillas, Chionodoxas and Muscari, with, later on, the Brodiaeas as well as those loveliest flowers, the Lilies-of-the-Valley. Few, if any plants have been more developed than the Crocuses, with the result that the garden may be made gay and lovely with brilliant yellow and softest of mauve-blues. For sheltered places and enterprising gardeners there are, of course, the autumn and winter-flowering Crocuses, but those who play for safety are content to raise these delicate beauties in the shelter of a cold frame and for bringing sunshine into the house during the dark days. Surely no garden lover's household should lack a few bowls of bulbs in winter time. Then there are the "bulbs"—using the term in a loose, but convenient sense—which produce summer and autumn flowers—the Lilies, Gladioli, Colchicums, Watsonias, Belladonna Lilies, and stately Galtonias. How beautiful these all are needs no saying. To-day he who walks through Hyde Park—a place of floral enchantment woven by the skilled hand of a great gardener—must admire most of all the broad breadth of pink-mauve Colchicums in the grass beneath the trees. All the summer and autumn "bulbs" should also be ordered and planted in good time. It is true that some leave the Gladioli in the ground, but it seems to us from our own observations that the new disease of Gladioli marked by a yellowing and a withering of the leaves, is much more prominent on plants which wintered in the ground than it is on those which have been newly planted. If so, though the gardener may grieve, the florist will be pleased to assuage his grief by providing corms which are free from this menacing disease. Lily bulbs planted early and well in soil containing plenty of humus, if well done, give, generally speaking, the finest display of all garden plants. Lilium *Henryi*, *L. auratum*, *L. a. platyphyllum* and *L. speciosum* flourish exceedingly if the top eighteen inches of soil are removed at planting time, the ground beneath broken up and enriched with a foot or so of well-decayed manure, and the soil then replaced, the bulbs being planted in the meantime, though, of course, not in immediate contact with the manure. Finally, there is much room for care and forethought in the way of planting. In the large garden where shrubs abound, the Lilies may appear in groups among the shrubs, but in the smaller garden, where perforce they have to be planted in beds, carpeting plants, delicate and choice, to remove any impression of legginess, may be used with great effect. Perhaps the most useful plants for this purpose are the Polyanthus, for they give a greenness to the ground when the Lilies are in flower; and they give also a bright promise of flowers during the spring, when the Lilies will be at rest.

"Iconum *Botanicarum* Index *Londinensis*."—The production of a new edition of Pritzel's great work has been looked forward to with great anticipation for many years past. Readers of *The Gardeners' Chronicle* are well aware that the new edition is being prepared by Dr. O. Stapf, at Kew, under the auspices of the Royal Horticultural Society, and that it will be printed by the Clarendon Press. A circular has just been issued in which it is stated that the *Index Londinensis* will be published in six volumes, two volumes to be sent out in each of the

years 1928, 1929 and 1930. In size, these volumes will approximate to those of the *Index Kewensis*, and the matter will be printed in three columns to the page. The cost of production is necessarily heavy, and the subscription price has been arranged on the basis of either (1) a lump sum of £25, payable in advance of publication, or (2) a subscriber's payment, £9 for the first two volumes and £4 10s. for each of the remaining four volumes. The price to non-subscribers on publication will be not less than £5 per volume. It was in 1855 that Georg August Pritzel published his first edition of the *Iconum Botanicarum Index*, and in 1866 he issued a supplementary list of references up to the end of the year 1865. From thence to the present time, these two volumes, containing over 107,000 references to illustrations of flowering plants and Ferns, have remained the standard alphabetical register or book of reference to the illustrations of plants which have appeared in botanical, horticultural and other publications. In more recent years greater facilities for reproducing illustrations of plants have naturally led to a vast increase of these illustrations, therefore it became desirable to attempt to prepare a continuation of this great index. In 1917, the Council of the Royal Horticultural Society decided to undertake the revision and continuation of Pritzel's *Index*, and Dr. Otto Stapf was appointed editor. The Director of the Royal Botanic Gardens, Kew, placed accommodation at the disposal of the Society as well as the use of the Kew library, and permitted the manuscript supplement of the Pritzel *Index*, which has been continued at Kew, to be typed for the revision. The great task is now nearing completion, and the first portion is ready for the press. The new edition will contain 450,000 references to illustrations of flowering plants, Ferns and Fern allies published in botanical, horticultural and other works and journals between the years 1753 and 1920 inclusive, and also all the references in the original *Index*. The circular referred to above states that all botanical plates and figures are cited as they are given in the respective publications, and no attempt has been made to correct the name of a plant which may now be known under some other name. Obvious errors, other than taxonomic, have, however, been corrected. In order to obviate the disadvantage of the lack of uniformity in nomenclature those generic names which are now regarded as synonyms are cited under the generic names now generally accepted. For example, *Amygdalus* and *Cerasus* are cited under *Prunus*, and cross-references are given from them to the latter genus. We learn with very great pleasure that references to figures of some of the more important hybrids have been included, but, of course, it has been impossible to index the illustrations of numberless garden varieties of flowers and plants. In short, the basis of the selection has been: (a) all plates and drawings, whether reproduced from photographs or not, are included, if accompanied by a scientific botanical name; (b) all reproductions of sufficient botanical, horticultural, scientific, artistic, or historical value are included; (c) it has not been considered necessary to include all the plates or drawings in a work, but only those which conform to the conditions laid down; (d) the illustrations cited, as is the case in the original Pritzel, are of Phanerogams or Pteridophytes, or of some parts of such plants, but purely anatomical or teratological figures are not registered; (a) attention has been paid to "habit" figures, more particularly in the case of trees, and to analyses or any part-illustrations which depict differential characters essential for the determination of species, and for such figures special symbols or abbreviations are employed. The circular contains a reprint of page 17, and in this we notice there are no fewer than seven references to illustrations which have appeared in *The Gardeners' Chronicle*.

A Great Dahlia Exhibition.—The exhibition of the National Dahlia Society, held on Wednesday last, was probably the biggest display of Dahlias ever held in this country, and marked the highest tide of prosperity the society has ever reached. All lovers of this beautiful

autumn flower will be gratified to learn that the membership of the National Dahlia Society has been doubled within the past three years, and already this year the Society has enrolled fifty new members, thanks, chiefly, to the energy displayed by Mr. W. J. Chittenden, the Hon. Secretary. There were between forty and fifty thousand blooms at the show, and they served to fill the whole of the Hall, a few exhibits remaining from the R.H.S. show of the previous day being accommodated in the annexes. Since the shows of the N.D.S. were held in the Royal Aquarium, Westminster, and the Crystal Palace, Sydenham, the type of flower exhibited has changed considerably, for whereas in the old times, Show, Fancy, Cactus and Single Dahlias were the principal types displayed, the modern Paeony-flowered, Decorative and even the Star and Collette types are now the most numerous. The Show and Fancy sorts have almost dropped out of cultivation, and we doubt if any grower nowadays would be able to show thirty-six distinct varieties, or even twenty-four, as in the old days when such growers as Turner, of Slough; Seale, of Sevenoaks; Mortimer, of Farnham; and Smellie, of Busby, were pre-eminent with this type of flower. One reason of the decline of the Cactus Dahlia in favour was its inferiority for garden purposes compared with the others. Some of these modern garden varieties have flowers of exceptionally large size, such as the orange-buff Berengaria; the light red Mabel Lawrence; the rosy-mauve Susan G. Tevis, and the pink Kitty Dunlop. Each year raisers submit large numbers of new varieties for award, and at the show on Wednesday no fewer than eighty new varieties were considered by the joint R.H.S. and N.D.S. Committees. The show attracted exhibits from Holland and Belgium, and altogether the entries numbered three hundred.

Laelio-Cattleya Canberra.—We are asked by Messrs. Cowan and Co. to state that Laelio-Cattleya Canberra, an illustration of which was published in our issue of September 10, p. 207, received a First Class Certificate from the Royal Horticultural Society's Orchid Committee, and not, as stated under the illustration, an Award of Merit. We are glad to congratulate Messrs. Cowan's on having obtained the higher award for this very beautiful hybrid.
